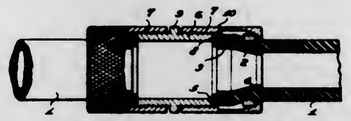
Application May 11, 1934, Serial No. 725,210
2 Claims. (Cl. 268—124)

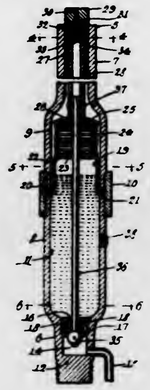
1. The combination with a vertically sliding window, of a window operator comprising a bar on which the window is mounted, a threaded shaft, a motor, a motor shaft extending from the motor, a friction clutch connecting the motor shaft and threaded shaft, a bearing in which the upper end of the threaded shaft is mounted, means for adjusting the bearing whereby the friction clutch is regulated, and means for transmitting movement of the threaded shaft to the bar, whereby the bar and window are moved vertically.



2,000,480
BLOWER, MORE PARTICULARLY FOR USE IN VACUUM CLEANERS
Engelbert Gorissen, Wuppertal-Barmen, Germany
Application March 21, 1934, Serial No. 716,491
In Germany May 31, 1933
4 Claims. (Cl. 230—133)

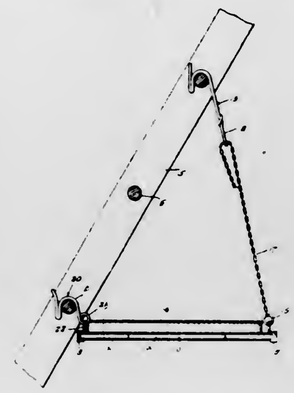
1. A blower, more particularly for vacuum cleaners, comprising a casing, a vane wheel revolubly mounted in the casing, an air outlet, and an air guiding passage between the vane wheel and the peripheral wall of the casing, the said air guiding passage being a helical passage rising

uniformly throughout its entire length round the axis of the vane wheel, and merging into the air outlet without any sharp edge or corner upon which the current of air produced by the vane wheel can impinge.



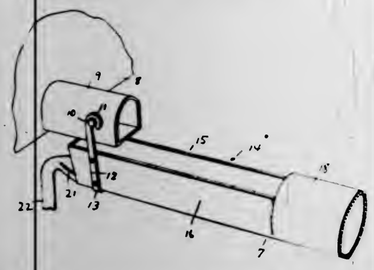
2,000,481
HOSE COUPLING
Charles Harrison, Vancouver, British Columbia, Canada
Application June 27, 1933, Serial No. 677,940. Renewed March 15, 1935. In Canada November 23, 1932
1 Claim. (Cl. 285—86)

A hose coupling adapted for connection to a complementary member having a threaded and contacting face, said face comprising a straight tapered nipple having at its smaller end an integral cylindrical extension, said nipple being adapted for insertion into the free end of a hose and to afford a frictional grip between the cylindrical extension and the inner face of the hose, a collar internally threaded adjacent one end, a complementary member in threaded engagement with the threaded portion of said collar, a cam face formed internally of the collar adjacent the other end, the interior surface of the collar between the threaded surface and cam being reduced to form a groove, a split ring inserted in said groove and unremovable therefrom, and a hose member retained in said collar through the medium of the nipple split ring and cam face.



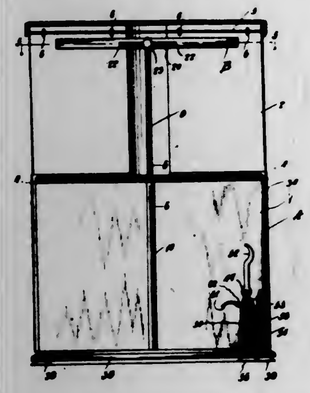
2,000,482
DIE OILER
James M. Hinkle, Barbourville, Ky., assignor to E. C. Kirby, Indianapolis, Ind.
Application January 30, 1934, Serial No. 709,035
4 Claims. (Cl. 10—126)

1. A die oiler comprising a die holder, a handle carried by the die holder and including a reservoir having an outlet discharging into the die holder, a valve controlling the flow of oil from the reservoir to the outlet, a compressible tubular expeller forming the top of the reservoir, a hollow stem connected to the expeller and constituting means for venting the expeller to the atmosphere, a portion of the stem being accessible to an operator, to actuate the expeller and to open the valve, an inwardly opening venting check valve carried by the stem, means extended through the expeller for connecting the stem to the first-specified valve, and return-spring means coacting with the



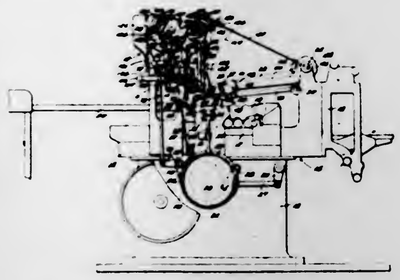
stem to close the first-specified valve and to effect a return stroke of the expeller.

2,000,483
LADDER BRACKET
Isaac E. Hogelin, Guthrie Center, Iowa
Application October 20, 1934, Serial No. 749,297
1 Claim. (Cl. 304—34)



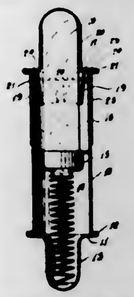
In combination with a ladder having rungs, a fabricated bracket for supporting a platform, said fabricated bracket including spaced parallel end members connected by means of centrally disposed base parallel transverse members, braces on each side of the transverse members are of substantially U-shape having diverging sides, the light portion of each brace being connected to the outer side of the transverse members and the free end of the brace connected to the inner side of the end members, a pivotally mounted hook at one end of the bracket for engaging an immediate rung of the ladder, a chain extending from the opposite end of the bracket and provided with a hook at its end for engaging an elevated rung of the ladder, and a swingable bail on the bracket for engaging over and retaining a platform on the said bracket.

2,000,484
SLAG CONVEYER
Joseph H. James, Salt Lake City, Utah
Application August 28, 1934, Serial No. 741,865
1 Claim. (Cl. 193—11)



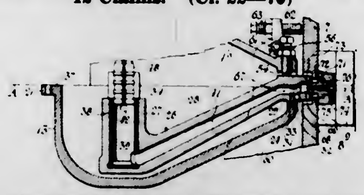
Means for conveying slag from a furnace comprising an inclined chute having a considerable portion of its receiving end of channel shape in cross section with its top open and its bottom flat and the remaining part of the chute being of integral tubular form whereby the top of said remaining part is closed, said inlet end of the chute having a rectangular shaped opening in its upper extremity opening directly upon the bottom of the chute and which is of the same length as the width of the bottom, a water supply pipe having a rectangular shaped outlet end connected to the chute and surrounding the opening, the bottom of the chute being plain to provide an even flow of the mixture of water and slag over the same, and means for discharging the slag into the channel part a slight distance below the water inlet opening.

2,000,485
BOOK HOLDER AND LINE FINDER
Paul A. Jones, San Francisco, Calif.
Application November 21, 1933, Serial No. 699,073
2 Claims. (Cl. 120—34)



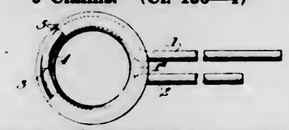
1. In a device of the character specified, a book support, a vertical rack, a supporting sleeve adjustably mounted on the upper end of the rack, a line finder carried by the supporting sleeve, an actuating lever and a ratchet and gear mechanism for intermittently lowering the rack and line finder when said lever is actuated.

2,000,486
AUXILIARY ROTARY PRINTING ATTACHMENT FOR PRINTING PRESSES
William M. Kelly, Westfield, N. J., assignor to American Type Founders Company, Elizabeth, N. J., a corporation of New Jersey
Application September 8, 1933, Serial No. 688,693
21 Claims. (Cl. 101—215)



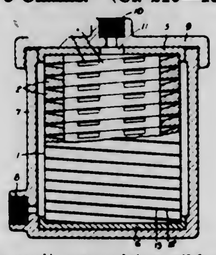
1. In combination with a printing press of the bed and cylinder type, an auxiliary printing attachment comprising a pair of side frames adapted to be secured to the frame of the press and to extend upwardly above the same, a printing cylinder having the usual opening in its peripheral surface mounted in said side frames for vertical bodily movement therein and disposed above the impression cylinder of the press, means for effecting said bodily movement of the printing cylinder to make printing contact with said impression cylinder, and paper feeding mechanism pivotally mounted at one end of the press and terminating adjacent the impression cylinder, said opening in the peripheral surface of said printing cylinder providing clearance for the end of the feeding mechanism when it is raised about its pivot for gaining access to the portions of the press beneath the same.

2,000,487
LIP STICK HOLDER
Arthur A. Koch, Beardsley, Minn.
Application April 2, 1934, Serial No. 718,699
7 Claims. (Cl. 206—56)



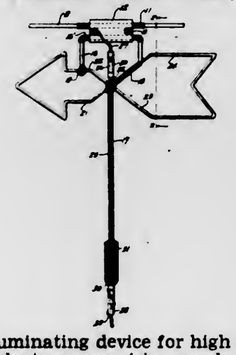
1. In a lipstick holder, a casing adapted to contain a lipstick, yielding means engaging the lipstick to normally project it from the casing, clamping jaws pivotally mounted in said casing and adapted to yieldingly engage the lipstick, spring means jointly engaging said jaws and unitarily moving them into clamping positions, and a cover for the casing provided with means to move said clamping jaws from engaging position.

2,000,488
DIE CASTING MACHINE
Torbjorn C. Korsmo, Madison, Wis., assignor to Madison-Kipp Corporation, Madison, Wis., a corporation of Wisconsin
Application April 16, 1934, Serial No. 720,905
12 Claims. (Cl. 22—70)



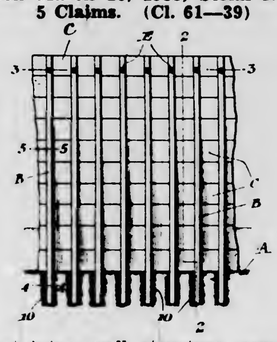
1. The combination in a die casting machine of a melting pot; and a pressure chamber in the melting pot, said pressure chamber having a metal discharge end fixedly supported by the melting pot, the opposite end of the pressure chamber being supported by the melting pot so as to permit variations in the size of the pressure chamber due to temperature changes therein.

2,000,489
THERMOCOUPLE MOUNTING
Karl M. Lederer, Newark, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J., a corporation of New Jersey
Application October 16, 1931, Serial No. 569,347
9 Claims. (Cl. 136—4)



1. A mounted thermocouple comprising a tubular metal body having an external circumferential groove, and a thermocouple carried by and extending circumferentially about said metal body, said thermocouple having the junction thereof and the adjacent portions of the couple wires seated in said groove.

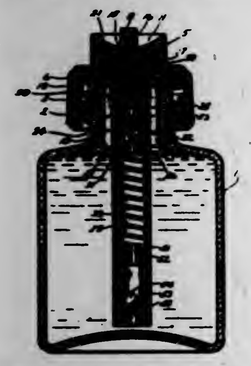
2,000,490
SLIT FILTER
Thor Fridolf Mandahl, Stockholm, Sweden, assignor to Svenska Ackumulator Aktiebolaget Jungner, Stockholm, Sweden, a corporation of Sweden
Application March 1, 1933, Serial No. 659,220
In Sweden March 7, 1932
6 Claims. (Cl. 210—169)



1. A filter unit comprising ribbons having adjacent faces in contact, each ribbon having one flat face and transverse contact ridges at its opposite face for engagement with the substantially flat surface of the adjacent ribbon, whereby a plurality of transverse filter passageways are formed between the ribbons by the respective adjacent pairs of ridges, each passageway having a cross-sectional area increasing in the filtering direction, said transverse ridges terminating short of the inlet edges of said ribbons to provide between adjacent ribbons a filtering slit uninterrupted by said ridges and extending continuously along the inlet sides of said ribbons.

2,000,491
ELECTRICAL ILLUMINATING DEVICE
Florian F. Manor, Oshkosh, Wis., assignor of one-third to A. B. Bechaud and one-third to A. T. Brenner, both of Fond du Lac, Wis.
Application September 9, 1932, Serial No. 632,359
2 Claims. (Cl. 177—329)

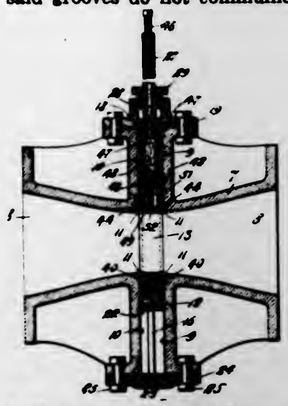
1. An illuminating device for high tension lines having conductors comprising an electrical illuminating tube having upper and lower terminals, a support to which said tube is secured, a clamp formed by a pair of complementary sections each having a pair of clamping grooves therein, means for drawing said sections together to rigidly secure a portion of one of the conductors of the high tension line in one set of grooves and to loosely engage the tube support in the other set of grooves, and means for electrically connecting the terminal of said tube to said upper conductor of the high tension line, said loose engagement of the clamp with the tube support providing for swinging movement of the tube to prevent breakage by the wind.



2,000,492
RETAINING WALL AND METHOD OF CONSTRUCTING IT
Henry Eugene McKeen, Montreal, Quebec, Canada
Application March 16, 1933, Serial No. 661,146
5 Claims. (Cl. 61—39)

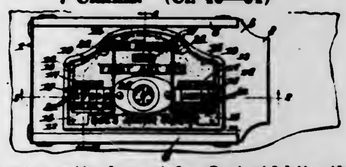
5. A retaining wall structure comprising in combination, a natural hard rock bed provided

with a series of parallel vertical cylindrical sockets uniformly spaced and cut therein below the ultimate surface level, a plurality of vertically extending parallel I-beams seated on end in each socket having their flanges adjacent to the walls of the sockets and extending as integral units to the top of the wall, the depth of each socket being only a small fraction of the length of its associated beam, a bond of plastic setting material in each socket rigidly uniting the inserted beam ends with the rock, bearing members connecting the upstanding portions of the beams to receive a horizontal load and supported by the beams.



2,000,493
LIQUID DISPENSING DEVICE
Jacob C. Miller, Whitefish Bay, Wis.
Application December 18, 1933, Serial No. 702,885
6 Claims. (Cl. 221—102)

1. In a liquid container having an apertured neck, the combination with an apertured cap secured thereto, of a tube secured to the inner face of said cap co-axially with said aperture, a plunger reciprocable in said tube, said plunger having a piston portion, a plunger portion of less diameter than said piston portion and a second portion of less diameter than said plunger portion extending through said aperture of said cap and providing a valve portion between said plunger portions adapted to seat upon the margin of said aperture, said plunger also having a recess in its piston portion communicating with the space between said plunger portions and said tube, valve means in said recess, valve means at inner end of said tube, and a spring disposed between said means whereby to normally hold valve portion of said plunger in contact with said cap.



2,000,494
VALVE
Sven Johan Nordstrom, Piedmont, Calif., assignor to Mereo Nordstrom Valve Company, San Francisco, Calif., a corporation of Delaware
Application November 4, 1930, Serial No. 493,252
13 Claims. (Cl. 251—60)

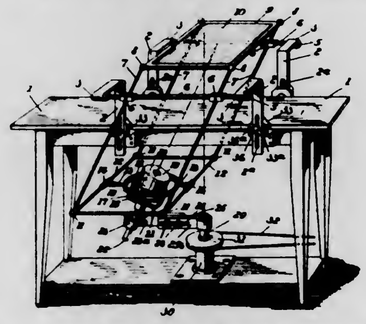
1. A valve comprising a casing provided with a port and having parallel valve-seat walls, a parallel-walled slide arranged to slide between the valve-seat walls, said slide having a hole adapted to register with the port in the open position of the slide, the valve-seat walls and the slide being provided with grooves arranged to form a closed circuit groove surrounding the port at a substantially uniform distance therefrom when the slide is in open position and so disposed whereby in moving to closed or open position said grooves do not communicate with

the port area, and pressure means for filling the grooves with lubricant or sealing substance.

2,000,495
COVER ATTACHMENT FOR FIRST AID KITS
Joseph L. Peavey, Meridian, Miss.
Application August 25, 1933, Serial No. 686,817
7 Claims. (Cl. 40—64)

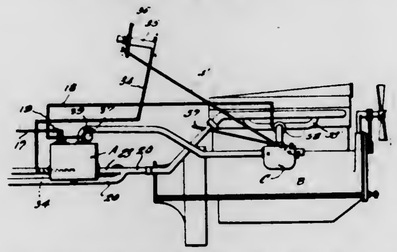
1. A cover attachment for first aid kits, the kit comprising a box and a cover, said attachment consisting of a slide, letter and number units and means for attaching them to the slide, and means on the cover constituting a pocket in which the slide is insertable, said pocket means having an opening through which the letters and numbers are visible.

2,000,496
HAIR CURLING DEVICE
Rocco Pezzella, Washington, D. C.
Application January 11, 1934, Serial No. 706,278
12 Claims. (Cl. 132—33)



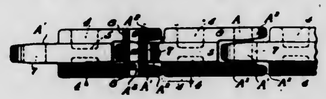
1. A hair curling device comprising a frame, a rotatable mandrel journaled on the frame and on which the hair is wrapped, and a pressure roller cooperating with the mandrel and journaled on the frame, said roller pressing against the hair wrapped upon the mandrel.

2,000,497
METHOD OF AND APPARATUS FOR MAKING RÖNTGEN PROJECTIONS
Ernst Pohl, Kiel, Germany
Application November 28, 1928, Serial No. 322,496
In Germany November 29, 1927
1 Claim. (Cl. 250—34)



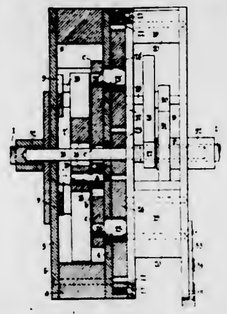
In an apparatus for controlling the direction of Röntgen ray projections, the combination of

a support for the object to be projected, with a prismatic frame comprising articulated members straddling said support, an image carrier mounted in the upper end of the frame above said support, supports for the frame on opposite sides of the object support, pivotal connections between the frame and said supports with the pivots included in a plane parallel to the object support and to the image carrier, a gimbal mounted in the lower end of the frame, a rod extending from the inner element of the gimbal and alined with the axis thereof, a rotatable shaft mounted in a bearing with its axis normal to the center of



the plane including the said pivotal connections, means for rotating the shaft, an arm fixed at one end on the shaft, a swivel connecting the other end of the arm with the rod extending from the gimbal, the rotation of the shaft operating through the intervening mechanism to impart conical pendulation to the frame, and a casing enclosing a Röntgen tube and having an opening for the passage of a confined bundle of rays, said casing being mounted on the inner element of the gimbal so that the bundle of rays emanating from the opening will always be directed toward the image carrier.

2,000,498
GASOLINE ENGINE FUEL VAPORIZER
Dudley Yates Rickabaugh, Kelseyville, Calif.
Application October 27, 1932, Serial No. 639,772
6 Claims. (Cl. 261—15)

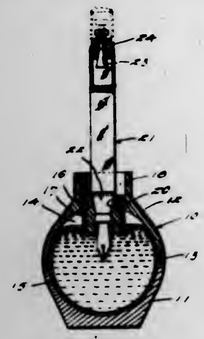


1. In combination, a gasoline vaporizing tank for internal combustion engines formed with horizontal tubes adjacent the bottom thereof, automatically controlled exhaust pipe branches extending through said tubes in spaced relation thereto for heating the gasoline, a header mounted on the tank having at least one screened opening, a plurality of spaced relatively small aerating pipes extending from the header and terminating in the vaporizing tank adjacent the bottom thereof, a mixing bowl adapted for communication with an intake manifold, a suction pipe constituting a passage between the mixing bowl and the vaporizing tank, an air inlet pipe forming a communication with the mixing bowl, and interconnected valves controlling the air inlet communication and the suction passage.

2,000,499
CONVEYER
Robert John Roland, Cincinnati, Ohio, assignor to The Alvey-Ferguson Company, Oakley, Cincinnati, Ohio, a corporation of Ohio
Application August 8, 1932, Serial No. 627,965
15 Claims. (Cl. 198—189)

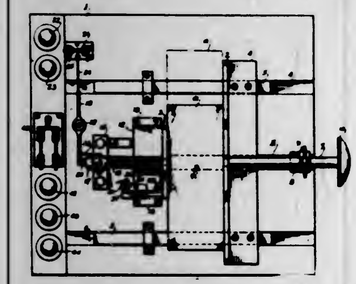
15. In a carrier chain, a pair of links and a pivot pin connecting said links with each other, one of said links having a member which has pivotal movement in planes perpendicular to each other upon said pin and said pin having shoulders contacting the sides of said member at all times in said movements of the latter.

2,000,500
POWER TRANSMITTING MECHANISM
Louis Joseph Turner, Ottawa, Ontario, Canada
Application January 19, 1934, Serial No. 707,388
In Canada January 6, 1934
11 Claims. (Cl. 74—260)



1. A variable speed power transmitting mechanism comprising a driving shaft, a driven shaft, centrifugally operated means driven by said driving shaft, an epicyclic gear associated with the driven shaft, pivot means projecting from said planet gears, a bar supported by said pivot means, and a crank pin driven by said centrifugally operated means and in driving engagement with said bar.

2,000,501
INK WELL AND PEN FILLING DEVICE
David E. Wade, Albany, N. Y.
Application April 26, 1934, Serial No. 722,579
3 Claims. (Cl. 120—64)



1. An ink well, comprising a rigid body having a chamber therein, a neck carried by the body communicating with the chamber, a collapsible ink holding member in the chamber, a yieldable pen engaging member carried by the ink holding member for sealing an end of a pen therein while

permitting collapsing of the ink holding member, and means for slidably mounting said pen

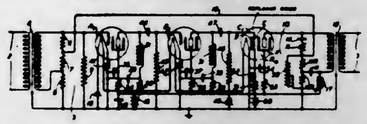
engaging member in the neck of the body, said latter means being non-yieldable in construction.

2,000,502
TESTING APPARATUS
Henry Christian Weikel, Jr., Baltimore, Md., assignor to The United States Printing and Lithograph Co., Baltimore, Md., a corporation of Ohio
Application December 5, 1929, Serial No. 411,871
13 Claims. (Cl. 177—311)

1. A testing apparatus comprising a support, cooperating members having parallel plane confronting gauge faces perpendicular to said support, guides on said support for said cooperating members, said members being slidable relative to said support in a direction perpendicular to said plane faces, one member functioning as a pusher for the object under test, means to permit the yielding of the other member through a narrow range determining the tolerance in the width dimension of the object, means for operating said pusher, and an adjustable stop for limiting the inward travel of said pusher thereby determining what shall be considered the correct width of the object.

2,000,503
VEHICLE JACK
Tom C. White, Billings, Mont.
Application June 25, 1934, Serial No. 732,313
12 Claims. (Cl. 254—133)

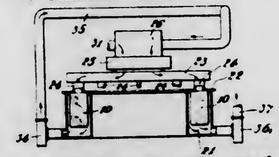
1. A self-centering, lifting head for jacks comprising an upwardly curved, elliptically shaped plate, one end of the curved plate rising to a



greater height than the other end of the said plate.

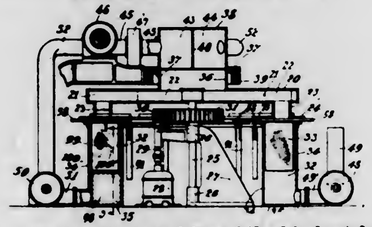
2,000,504
KNOT-FORMING MECHANISM
Emile Adrian, St. Michel-sur-Meurthe, France
Application February 27, 1933, Serial No. 658,870
In France and Germany March 10, 1932
3 Claims. (Cl. 289—3)

1. In a mechanism for forming a weaver's knot of the type comprising rotary pincers, on both sides of which the two threads to be tied are elongated and held between means for tightening and crossing threads disposed on both sides of the said rotary pincers, also scissors for cutting the threads according to the formation of the knot by rotation of the pincers after crossing threads; a unit comprising a pair of scissors and a stretching hook movable about an axis perpendicular to the axis of rotation of the rotary pincers, means for conjugating the angular displacements of the said rotary pincers and the said unit so that, in the last 90 degrees through which the rotary pincers passes, the hook commences to disengage the knot formed on the pincers and the scissors operate to grasp, cut and retain the same end of thread as that under which the hook has passed so that the correct tightening of the knot is effected by exerting a tightening pull on the thread ends.



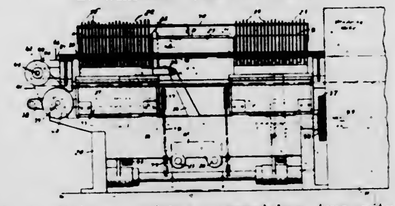
2,000,505
VACUUM TUBE APPARATUS
Harold S. Black, Westfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 26, 1933, Serial No. 691,001
6 Claims. (Cl. 179—171)

1. A vacuum tube amplifier comprising three tubes in cascade connection and means for reducing distortion of waves transmitted therethrough by feedback of distortion components originating in the amplifier, each of said tubes comprising a cathode and an anode and a negatively biased control grid therebetween, each of the first two tubes having a positively biased screen grid between its anode and its control grid



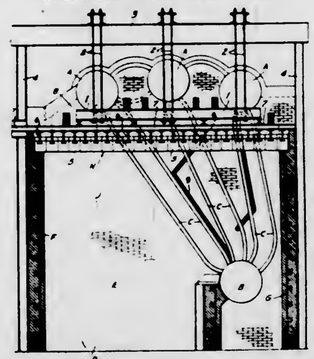
for reducing its anode-control grid electrostatic capacity, and the third tube having its control grid fed from the second tube and having a positively biased space charge reducing grid principally in the same surface as its control grid and at substantially the same location as said control grid with respect to its anode and its cathode.

2,000,506
METHOD FOR DRYING BURLAP BAGS
Lloyd T. Bromfield, New York, N. Y.
Application February 25, 1932, Serial No. 595,010
3 Claims. (Cl. 34—24)



3. In a method of removing enmeshed sugar particles from, and drying, the moist material of a burlap sugar bag, the steps which consist in expanding the mouth-opening edge portion of the bag to an extent effective to suit extensive expansion of the bag body, by applied retaining means supporting the bag body from said edge portion in gravity pending position and entirely free of the retaining means from the edge portion, entirely covering over the expanded mouth-opening to enclose the chamber of the bag, passing drying fluid while the bag is so suspended, into the chamber of the bag under unrestrained force and in an amount sufficient to expand the bag body outwardly in every direction thereby effectively stretching the fibers of the bag and enlarging the pores thereof throughout the area of the bag, simultaneously maintaining the fluid of application at a temperature sufficiently high, while avoiding any distilling action of the fiber oils, to cause removal by abstraction of the moisture contained in the fibers and in the therein enmeshed sugar particles, such removal of moisture being effective to bring about a weakening in the adhesion between the sugar particles and the stretched fibers, and simultaneously maintaining the whole amount of fluid within the bag chamber under a controllable pressural force greater than the weakening adhesion between the sugar particles and the stretched bag fibers, thereby without inherent injury to the bag to detach and remove sugar particles from the fibers thereof while at the same time to remove the moisture content of the fibers and thoroughly dry the bag in its entirety.

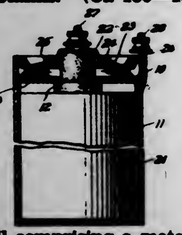
2,000,507
MACHINE FOR TREATING BAGS
Lloyd T. Bromfield, New York, N. Y.
Application May 18, 1932, Serial No. 612,030
24 Claims. (Cl. 34—12)



1. A bag treating machine of the kind set forth, comprising an endless circular channel-shaped treating chamber for the bags, a top section continuously closing the chamber and having independently working means supporting the bags, mouths upward therein, and expanded and covered by the section itself, said section being mounted for rotary movement and adapted, when moved, to move the bags in the chamber, passages formed in the top section for conducting and discharging treating fluid directly through the expanded mouth openings into the interiors of the individual bags during the movement of the bags in the chamber, means for supplying treating fluid under pressure to said passages, and means for periodically closing said passages.

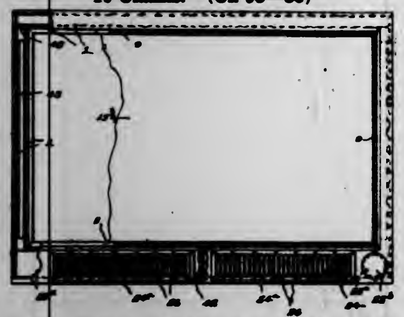
2,000,508
SLICING MACHINE
Wilhelm B. Bronander, Montclair, N. J.
Application February 27, 1931, Serial No. 518,631
17 Claims. (Cl. 146—153)

2. A slicing machine comprising two sets of slicing mechanisms, means operatable alternately to move articles to be sliced into operative position relative to said slicing mechanisms, means for feeding said articles through said slicing mechanisms, a conveyor, and means for imparting an intermittent feed to said conveyor, said article feeding means operating to feed said sliced articles into alternate spaces on said conveyor.



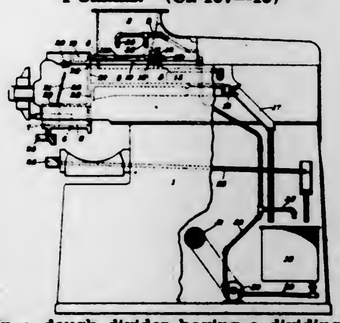
2,000,509
STEAM GENERATING APPARATUS
Samuel F. Burnet, Webster Groves, Mo., assignor to Laclede Christy Clay Products Company, St. Louis, Mo., a corporation of Missouri
Application April 4, 1932, Serial No. 603,000
2 Claims. (Cl. 122—302)

1. A steam generating apparatus composed of a plurality of small boilers arranged side by side, a setting comprising a front wall and side walls, each of said small boilers comprising tubes that extend parallel to the side walls of the setting and drums attached to said tubes and disposed transversely of the boiler in parallel relation to



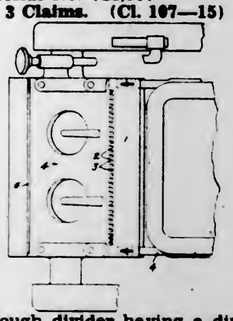
the front wall of the setting, the tube banks of the respective boilers extending parallel to each other and being disposed at the rear side of the combustion chamber in opposed relation to the front wall of the setting, and a suspended arch structure arranged between the tube banks of adjacent boilers so as to form part of the roof of the combustion chamber and extending from the front wall to the rear wall of the setting, whereby the gases in the upper portion of the combustion chamber will be deflected laterally into the tube banks located at the opposite sides of said arch structure.

2,000,510
DRY CELL
Peter Corigliano, St. Albans, N. Y., assignor to Bright Star Battery Company, Hoboken, N. J., a corporation of New York
Application March 2, 1932, Serial No. 596,223
5 Claims. (Cl. 136—133)



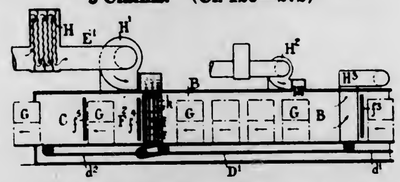
1. A dry cell comprising a metal cup containing a cartridge having a centrally arranged electrode, a metal cover comprising a central continuous metal portion recessed to receive and enclose the upper end of said electrode, and an outer continuous metal portion having rigid, permanent connection at its outer edge with the rim of said cup, the outer edge of the central portion and the inner edge of the outer portion being crimped together and forming a permanent mechanical connection between said portions, and insulation interposed between said central and outer portions.

2,000,511
SELF CONTAINED WINDOW STRUCTURE
Oliver M. Edwards and Roy T. Axe, Syracuse, N. Y., assignors, by mesne assignments, to The Syracuse Trust Company, Syracuse, N. Y., a corporation of New York, trustee
Application August 23, 1929, Serial No. 389,057
10 Claims. (Cl. 98—88)



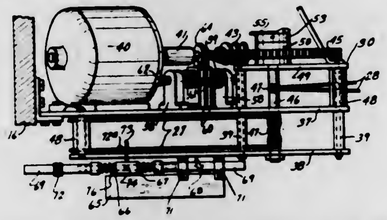
1. In a unitary window construction, a hollow frame mountable in the frame of a window opening of a structure and having means for supporting a pane, the bottom rail of the hollow frame, which coacts with the sill portion of the window opening, being provided with air intake openings through the outer wall thereof and one of the upright frame members of the hollow frame being formed with inlet openings through its inner face, whereby air circulates from the outer side of the window through the bottom rail and from the bottom rail into the upright frame member and out through the ventilating openings.

2,000,512
LUBRICATING SYSTEM FOR DOUGH DIVIDERS
Gustav B. Eggert, Saginaw, Mich., assignor to Baker Perkins Company, Inc., Saginaw, Mich., a corporation of New York
Application February 16, 1933, Serial No. 657,040
4 Claims. (Cl. 107—15)



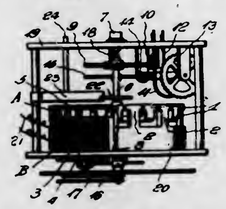
4. In a dough divider having a dividing head reciprocable relative to the frame of the machine, in combination, an oil reservoir extending along the upper edge of the working face of the machine and closed along said edge to retain oil by the working face of said dividing head, an oil reservoir in and opening onto the working face of said dividing head so located as to come into communication with said first-mentioned reservoir once in each reciprocation of the head to receive oil therefrom by gravity flow.

2,000,513
OIL WIPER
Gustav B. Eggert, deceased, late of Saginaw, Mich., by Bernard H. Liskow, administrator, Saginaw, Mich., assignor to Baker Perkins Company, Inc., Saginaw, Mich., a corporation of New York
Original application February 16, 1933, Serial No. 657,040. Divided and this application March 5, 1934, Serial No. 714,067
3 Claims. (Cl. 107—15)



1. In a dough divider having a dividing head mounted for rotary reciprocation, an oil reservoir in said head, a stationary oil reservoir arranged to feed a film of oil onto the working face of said head during its motion in one direction, and a stationary scraper positioned between said reservoirs in co-operative relationship to the working face of the head to impel the oil of said film into the reservoir in said head during its motion in the opposite direction.

2,000,514
APPARATUS FOR PASTEURIZING MILK AND OTHER SUBSTANCES
Arthur Guy Enock, Wembley Park, England
Application January 22, 1934, Serial No. 707,700
In Great Britain January 27, 1933
5 Claims. (Cl. 126—272)



1. Pasteurizing apparatus for liquids in bottles comprising a plurality of chambers in alignment, horizontally disposed and maintained at different temperatures, automatic conveyers by which the bottles are moved progressively through the chambers, air locks at the inlet to and outlet from the apparatus and between the several chambers, said air locks having doors or shutters at each end thereof, further automatic conveyers by which the bottles are traversed between the chambers and means adjacent to each chamber to heat or cool the air and force it into the respective chamber.

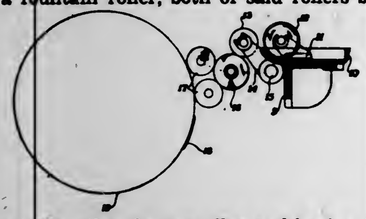
2,000,515
DOOR OPERATING DEVICE
Leo H. Gross, Bartelso, Ill.
Application March 21, 1932, Serial No. 600,148
9 Claims. (Cl. 268—63)

1. In combination with a building and doors pivotally mounted to swing outwardly from said building, an electric power operator unit within the building, and near the door opening, cables actuated by the operating unit, means confining each cable to a path of movement toward and away from the doors and door opening, and a pair of pivoted arms serving as connections between the cables and each of the doors, one of said arms being pivotally carried by the associated door, and the other arm pivotally mounted within the building, said arms being adapted, upon actuation of the cables in one direction, to cause a swinging movement of the doors away from the building and toward open position, switching means carried by the operator unit including a switch-actuating plunger and an arm on the plunger, the plunger and arm being disposed for selective engagement by door-carried elements.

2,000,516
ELECTRIC MOTOR AND CLOCK MECHANISM
Arthur William Haydon, Hinsdale, Ill.
Application November 16, 1929, Serial No. 407,636
11 Claims. (Cl. 172—275)

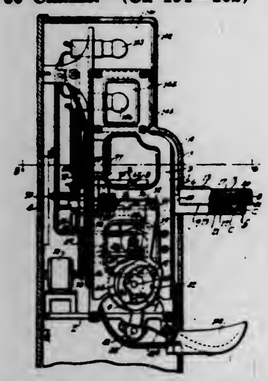
1. The combination of a non-self-starting motor having primary and secondary members one of which is of magnet material and of uniform reluctance in all directions, and a spring connected to one of said members for reversing its direction of rotation, the motor being capable of developing a sustained unidirectional torque of less duration than the period of oscillation of said last named member.

2,000,517
DOOR FOR FIRE ALARM BOXES AND THE LIKE
Paul P. Horni, Newark, N. J.
Application October 18, 1930, Serial No. 489,687
4 Claims. (Cl. 177—372)



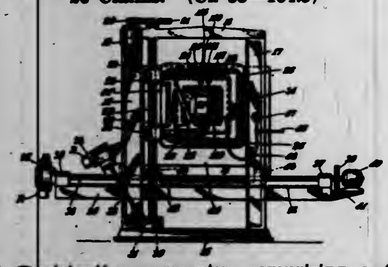
1. In a fire alarm box, the combination of a frame, a movable door thereon, a frangible element mounted in the door, a latch engaging said element for holding said door in partially closed position, and means inside of said door rendered effective by movement of said door toward fully closed position for breaking said element to release said latch.

2,000,518
LITHOGRAPHIC PRINTING MACHINE
Albert J. Horton, White Plains, N. Y., assignor to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York; Irving Trust Company, permanent trustee for said R. Hoe & Co., Inc.
Application March 16, 1932, Serial No. 599,135
4 Claims. (Cl. 101—148)



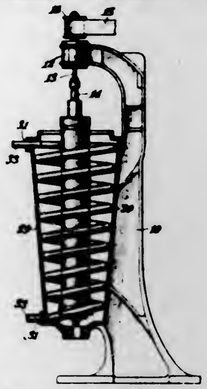
1. In a dampening mechanism for a lithographic printing machine, a distributing roller

and a fountain roller, both of said rollers being



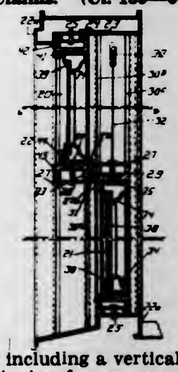
formed of rustless ferrous alloy and having their exterior surfaces grained to a mat finish.

2,000,519
COIN SELECTOR
George McD. Johns, near Sappington, Mo.
Application January 19, 1931, Serial No. 509,581
60 Claims. (Cl. 194—102)



45. Coin-selecting apparatus comprising, in combination, means for simultaneously gauging the weight and thickness of a coin, coin-distributing means, and electrically operable mechanism for actuating the distributing means during the gauging of the coin.

2,000,520
APPARATUS FOR SECURING REGISTRATION POSITION OF AN ARTICLE
Harry C. Jones, New York, N. Y.
Application April 19, 1929, Serial No. 356,326
26 Claims. (Cl. 33—184.5)

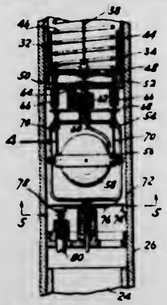


1. Registration apparatus comprising a first member, a second member relatively movable with respect to said first member, adjustable physical registration means attached to one of said members and selectively movable relative thereto, means attached to the other of said members for engagement with said registration means to cause relative movement between said registration means and its attached member when said first and second members are moved relatively, and locking means for fastening said registration means in place when said registration means has been moved to an adjusted position.

2,000,521
CENTRIFUGAL TREATMENT OF SUBSTANCES AND MECHANISM THEREFOR
Leo D. Jones, Philadelphia, Pa., assignor to The Sharples Specialty Company, Philadelphia, Pa., a corporation of Delaware
Application June 13, 1931, Serial No. 544,083
3 Claims. (Cl. 233—11)

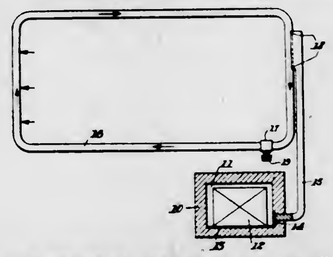
1. The method of separating bacilli from a culture medium which comprises subjecting said medium to centrifugal force in a centrifugal rotor to separate said bacilli from the medium by deposition of the bacilli against the wall of the rotor, and extracting heat from the rotor wall during such centrifugal treatment at a controlled rate adapted to prevent deleterious effect upon said bacilli of heat generated by said centrifugal treatment.

2,000,522
WINDOW
Albert Kaspar, Cicero, Ill.
Application October 25, 1932, Serial No. 639,397
2 Claims. (Cl. 189—66)



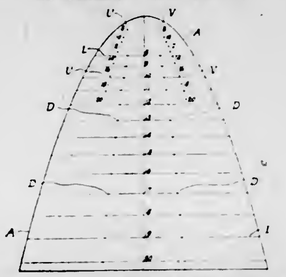
1. A window including a vertical movable sash, a relatively swinging frame mounted within and movable with the sash, a sealing element for the frame carried by the sash on the side and upper rails of the latter, means integral with the frame for cooperating with said sealing elements when the frame is in closed relation to the sash, sealing means for the lower end of the frame and carried thereby, an element on the sash for cooperating with the latter sealing means when the frame is in closed relation to the sash, the cooperation of the element and sealing means permitting limited swinging movement of the frame without interfering with the seal.

2,000,523
TELEPHONE SOUND REPRODUCER
Harold D. Knapp, Merchantville, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application March 13, 1931, Serial No. 522,295
3 Claims. (Cl. 179—182)



1. In combination, a sound producing device provided with a main sound outlet and at least one minor sound outlet, a cushion surrounding said device, the cushion being provided with a main sound outlet to the exterior thereof, in alignment with the main sound outlet of the device, and means within the interior of the cushion providing a plurality of resonating chambers in acoustic communication with the minor sound outlet of said sound producing device.

2,000,524
WELL SURVEYING INSTRUMENT
Gottdank L. Kothny, Strafford, Pa., and Frederick C. Narvesen, East Rockaway, Long Island, N. Y., assignors to Sperry-Sun Well Surveying Company, Philadelphia, Pa., a corporation of Delaware
Application June 13, 1933, Serial No. 675,568
10 Claims. (Cl. 33—205)



1. In a well surveying instrument provided with means for indicating deviations of the instrument from the vertical, the combination of an element, means for delaying for a predetermined period the operation of the indicating means, a gyroscope connected to the element to insure the location of said element in a determinable azimuthal position during the operation of the indicating means, and means for maintaining the element, after the indicating means operates, in that position which it occupied relatively to the indicating means when the indicating means operated, whereby the azimuth of the deviation may be determined.

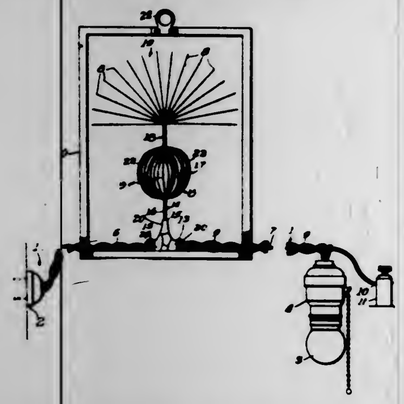
2,000,525
REFRIGERATING SYSTEM
Albert L. Lambert, Philadelphia, Pa., assignor to Heintz Manufacturing Company, a corporation of Pennsylvania
Application September 8, 1932, Serial No. 632,147
15 Claims. (Cl. 62—101)

11. In a device of the character described, an insulated compartment, a closed circulating system within and adapted to absorb heat from said compartment, a non-volatile liquid substantially filling said system, an insulated container, a solid refrigerant in said container, and a metallic conductor partly within the container and in heat exchange relation to both said system and said refrigerant.

2,000,526
COMPUTING DEVICE CONSISTING OF A MATHEMATICAL CURVE
Orley B. Lane, Washington, D. C.
Application February 26, 1932, Serial No. 595,377
11 Claims. (Cl. 33—1)

1. A plotting device consisting of a sheet of material having an outline formed as a moment curve having spaced parallel base lines representing different lengths of span to scale, said base lines being so placed that the ordinates from each respective base line to the outline of the curve represent the bending moment at the respective ordinates of the respective span to scale for a predetermined type and amount of load.

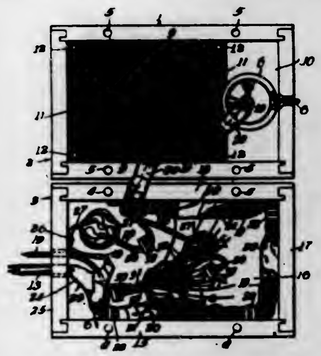
2,000,527
RECORDER CHART
Garrett B. Linderman, Jr., Pittsburgh, Pa., assignor to Pittsburgh Equitable Meter Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 21, 1931, Serial No. 570,216
4 Claims. (Cl. 234—1)



1. A recording instrument chart resisting expansion due to change in humidity consisting of a layer of aluminum foil uniformly adhesively secured between sheets of chart paper.

2,000,528
LAMINATED COMPOSITE PAPER
Garrett B. Linderman, Jr., Pittsburgh, Pa., assignor to Pittsburgh Equitable Meter Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 27, 1932, Serial No. 649,062
2 Claims. (Cl. 154—46)

1. A laminated composite stationery paper suitable for taking an inscription consisting of a layer of metallic foil adhesively secured to external sheets of paper of writing paper quality.



2,000,529
METHOD AND MEANS FOR IMPROVING RADIORECEPTION
Maurice H. Livingston, Chicago, Ill.
Application April 27, 1931, Serial No. 533,221
15 Claims. (Cl. 250—20)

1. In an apparatus of the kind and for the purpose described, a flexible radio antenna wire having a free end and being closely interwoven with a pair of electric circuit wires for a relatively short part of the total length thereof, the free end of the antenna wire having the individual wires thereof spread out in approximately fan shape and located at a point removed from the end of the electric circuit wires.

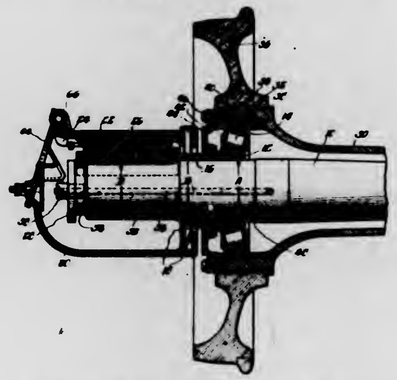
2,000,530
METHOD AND MEANS FOR IMPROVING RADIORECEPTION
Maurice H. Livingston, Chicago, Ill., assignor of forty per cent to Joseph M. Weisbaum and twenty-five per cent to J. Frederick Ahlbern, both of Chicago, Ill.
Application January 25, 1932, Serial No. 588,641
15 Claims. (Cl. 250—20)

1. The improvements herein described, and comprising a relatively short flexible multiple strand wire adapted to be connected at one end to the antenna circuit of a radio receiving set, a twin flexible wire adapted to be connected at one end to a supply circuit such as an electric light circuit, an electricity using device at the opposite end of said twin wire, a closed casing, the two wires closely interwoven together within said casing for a relatively short distance, the antenna wire returning close to but insulated from the

woven wires to the beginning of said interweaving, the end portion of the antenna wire being bared and the strands thereof opened and spread out to form a succession of disk-like formations.

2,000,531
REPAIR HOUSE CAR CONSTRUCTION
John P. McWilliams and Frank Ditchfield, Cleveland, Ohio, assignors to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio
Application November 25, 1933, Serial No. 699,690
7 Claims. (Cl. 105—469)

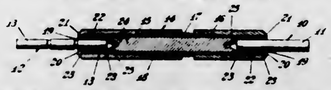
1. A repair construction for originally wood sheathed house car having a metal side sill of continuously uniform cross section throughout its length, including, in combination: a metal side plate; metal side posts; means connecting the upper ends of the posts and side plate; attaching brackets at and connected to the bottom ends of the posts, said brackets being directly secured to the outer side of the existing side sill; metal sheathing separately formed from and secured to the outer sides of the posts and along its upper edge to the side plate; and a metal bottom member having an upstanding flange located outwardly of the plane of the sill and secured to the lower edge of the metal sheathing, said posts being coped at their bottom ends to accommodate said upstanding flange.



2,000,532
WATERPROOF ABRASIVE PAPER
Carl Munch, Duren, Germany, assignor to Atlas-Ago, Chemische Fabrik, Aktiengesellschaft, Molkau-bei Leipzig, Germany, a German company
No Drawing. Application October 19, 1933, Serial No. 694,337. In Germany October 6, 1932
4 Claims. (Cl. 51—280)

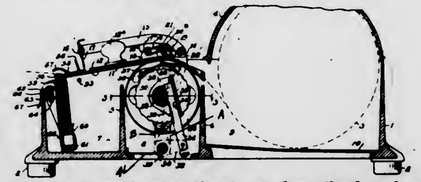
4. The process of producing a waterproof abrasive paper which comprises binding abrasive material to one face of an unsized paper by means of a collodium solution and treating the other face of paper to size and waterproof the same with an alcoholic rosin solution containing a solvent of the group consisting of ethyl acetate and acetone for bonding the rosin to the cellulose ester.

2,000,533
METHOD OF PRODUCING A FOOD POWDER
Robert T. Northcutt, Cranford, and Andrew Langstaff Johnston, Jr., Plainfield, N. J., assignors, by mesne assignments, to Food Concentrates, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application May 13, 1932, Serial No. 611,234
7 Claims. (Cl. 99—5)



1. The process of producing a food powder, which comprises forming an aqueous intimate mixture by incorporating ground oily nut-like material with a carbohydrate material containing hygroscopic sugar, and drying the mixture to produce a powder wherein the oily nut-like material gives protection against caking.

2,000,534
ROLLER BEARING AXLE
Alfred H. Oelkers, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application January 28, 1929, Serial No. 335,647
7 Claims. (Cl. 295—36)

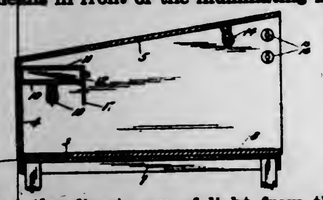


6. In combination with a housing, a shaft extending into said housing and having a journal portion disposed in said housing, a pair of abutments on said shaft disposed in said housing, a channel formed in said shaft adjacent one of said abutments, and wear means disposed on said journal portion and having a pair of abutments cooperating with said first named abutments, one of said last named abutments extending into said channel.

2,000,535
GAUGE
Fred W. Peisch, Chicago, Ill.
Application September 18, 1933, Serial No. 689,927
1 Claim. (Cl. 33—178)

A gauge holder comprising coaxially arranged sleeves having threaded interconnection for adjustment axially relative to each other; each of said sleeves having a bevelled annular shoulder formed integrally therewith on its inner peripheral surface and at its axially outer end; a chuck mounted in each of said sleeves and each of said chucks having engagement at its axially outer end with the corresponding one of said shoulders; each of said chucks having a bevelled axially inner end portion; and a solid cylindrical rod arranged in, and extending between, said sleeves and having opposite end portions projecting a substantial distance into said sleeves; said rod having its axially outer end portions bevelled for abutting engagement with the said bevelled axially inner end portions of said chucks; and said rod having recesses formed in its axial ends for the reception of the inner end portions of gauge members projected thereinto through said sleeves and chucks.

2,000,536
AUTOMATIC TAPE MOISTENER
Frank H. Poeppelmeier, Dayton, Ohio, assignor, by mesne assignments, to Better Packages, Inc., a corporation of New York
Application May 26, 1930, Serial No. 455,552
10 Claims. (Cl. 164—42)

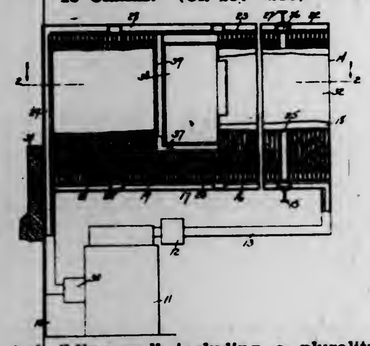


1. In a machine of the type described, a base for supporting a roll of tape, a tape advancing roller arranged for contact with the tape, operating means comprising an operating handle and a positive linkage connection between the handle and the roller for positive movement of the roller in a feeding direction when the handle is operated in one direction, said positive linkage connection causing gradual decelerating movement of said roller to the end of the feeding movement thereof upon constant movement of the operating handle, tape severing means, and means for operating said tape severing means from said operating means during the final movements of the handle in the said one direction, said positive linkage connection providing for feeding movement of the tape during only the first part of the movement of the operating handle in said one direction and then ceasing to advance the tape during the operation of said tape severing means.

2,000,537
MARK-OUT CABINET FOR PRESS MAKE-READY
Harrison S. Ransom, Moline, Ill.
Application August 15, 1932, Serial No. 628,840
8 Claims. (Cl. 240—2)

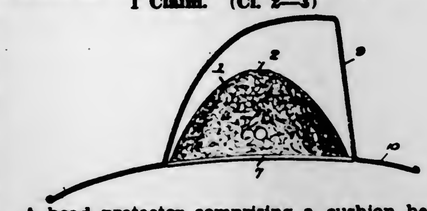
1. A cabinet of the character indicated having top, bottom, back, and ends which are impervious

to light and having its front open, illuminating means adjacent the back and spaced at intervals along same, reflecting means back of the illuminating means to assist in reflecting light forwardly and means in front of the illuminating means



to prevent the direct rays of light from the illuminating means from reaching the eyes of the user but which is so placed as to enable the light to shine upon a paper upon the bottom of the cabinet.

2,000,538
HAND BAG AND REVERSIBLE COVER THEREFOR
Murray H. Resnick, New York, N. Y.
Application February 23, 1935, Serial No. 7,798
9 Claims. (Cl. 150—28)

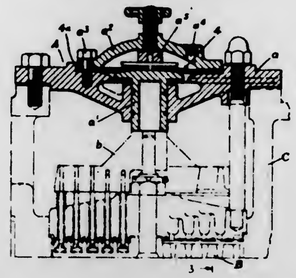


1. A device including a foundation bag member, a cover member therefor, a plurality of spaced fastener portions mounted on each of said members, and means for urging a fastener portion on one member with respect to the companion fastener portion on said member to affect the spacing therebetween for releasably engaging the fastener portions on the other member so as to mount the cover.

2,000,539
BUILDING STRUCTURE
Lester Beach Scheide, Hartford, Conn., assignor of one-half to Henry E. Sage, West Hartford, Conn.
Application May 26, 1932, Serial No. 613,610
18 Claims. (Cl. 257—256)

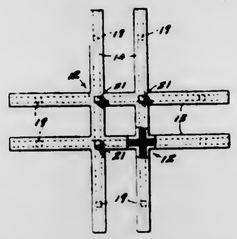
1. A building wall including a plurality of similarly formed building sections each of which includes a plurality of conducting tubes, a supply duct constituting the lower margin of a section with which one end of each conducting tube communicates, an exhaust duct constituting the upper margin of a section and communicating with opposite ends of said tubes, a return duct communicating with said exhaust duct, means for effecting flow of a temperature conditioning medium through said ducts, and means for conditioning said medium.

2,000,540
BELL LINING AND SHOCK ABSORBER
Henry B. Uhlmann and Joseph C. Myers, Philadelphia, Pa.
Application December 5, 1933, Serial No. 701,959
1 Claim. (Cl. 2—3)



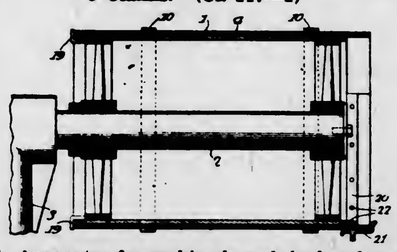
A head protector comprising a cushion head engaging element, a liner adjoining said element, said head engaging element being substantially dome shape throughout its wall with openings therein and adapted to extend within the crown of a fireman's helmet or other head gear, said liner adjoining close to the wall of the dome shape head engaging element and provided with cut out portions at intervals throughout the liner, elastic inserts secured to the edges of the cut out portions, a fabric binding strip adjacent the lower portion of the liner and extending down and underlying the edge of the cushion element and outwardly and upwardly against the cushion element adapted to form a hem, the inner and outer portions of the fabric binding strip being stitched through the liner and through the lower portion of the cushion element, and a tension element received within the hem, said hem and the tension element combined constituting a beading to contact with and on which the lower edge portion of the fireman's helmet rests.

2,000,541
HINGE AND REST
Eugene Van Note, Kearny, N. J., assignor of one-half to Max Kasson and Julius Kasson, both of New York, N. Y.
Application July 2, 1932, Serial No. 620,635
Renewed July 25, 1934
9 Claims. (Cl. 16—164)



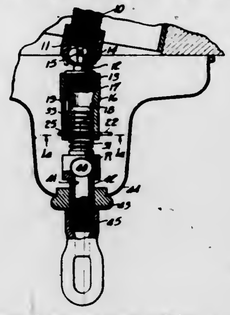
1. In combination with a door and door support, a hinge strap, means for hingedly mounting said strap at both ends, one end in said door and one end in the door support, said strap being extended at one end beyond its mounting, a hingedly mounted link on said extended portion, a rest connected with said link, said rest being adapted to move forward and backward upon the respective opening and closing of the door so as to bear upon the member adjacent said door when the door is open and be concealed when the door is closed.

2,000,542
FLUID PRESSURE CONTROL APPARATUS
Harry C. Wassen, Franklin, Pa., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey
Application May 19, 1931, Serial No. 538,447
1 Claim. (Cl. 137—157)



A fluid actuated device comprising an enclosure, a substantially flat diaphragm dividing said enclosure into two chambers, means for admitting pressure fluid to one of said chambers, and a plunger actuated by said diaphragm, said diaphragm comprising an inner layer of rubber and outer sheets or layers of leather, said layers being in contact with each other and secured to each other only at the peripheral edges thereof, the central portion of the diaphragm being imperforate and in loose engagement with a stop member in the fluid chamber and a plunger in the other chamber, the stop members being movable manually with respect to the enclosure to actuate the diaphragm and plunger.

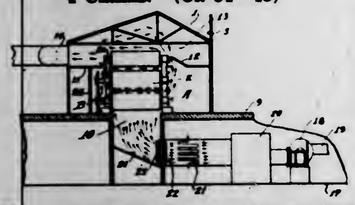
2,000,543
FRAME FOR CONCRETE COLUMNS
Walter H. Wheeler, Minneapolis, Minn., assignor to Frank K. B. Wheeler, Minneapolis, Minn.
Application November 3, 1930, Serial No. 493,053
Renewed February 10, 1934
11 Claims. (Cl. 72—76)



11. A device for supporting a floor slab upon a column of concrete construction comprising an integral metal frame having a central portion with a central opening extending vertically therethrough of comparatively large area, and a plurality of rigid bars integral with said frame and each having considerable height thus having great strength in shear and when acting as a beam, said bars extending outwardly from said frame into said slab and acting as cantilevers for supporting the load of said floor slab and transmitting the same directly to said column by shear stress.

2,000,544
BARREL
Thomas R. Winchell, West Newton, Mass., assignor to Northern Maine Plywood Company, Portland, Maine, a corporation of Maine
Application October 27, 1933, Serial No. 695,428
9 Claims. (Cl. 147—1)

1. Apparatus for making barrels by hand, comprising a rotary annular drum of less length than the barrel and whereon to wind a sheet of plywood into annular barrel form, with the projecting end of the barrel body open and unobscured, means on the drum to engage the top end of the barrel to position the bottom end thereof a distance beyond the end of the drum, said drum thus being adapted to permit insertion of a preformed head in the said open bottom end of the barrel, after said sheet is rolled on the drum, encircling clamps for holding the plywood in overlapping relation on the drum, adapted to be tightened thereon, whereby the said lap joint may then be permanently fastened together, said clamps being removable to permit fastening of the barrel head in the bottom end of the barrel and a support for the bottom end of the barrel, in the plane of said head, whereon the barrel is rotated during the operation of fastening the barrel head in place, said support being adjustable into and out of operative position, and being formed to engage the end edge of the barrel, thereby holding the latter against axial displacement.



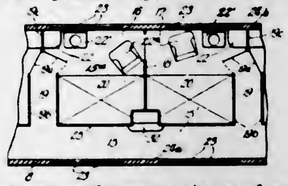
2,000,545
FIXTURE HANGER
Isidore Wolarsky, Mount Vernon, N. Y.
Application September 22, 1931, Serial No. 564,348
Renewed October 5, 1934
13 Claims. (Cl. 240—85)

1. A fixture hanger comprising a tubular supporting sleeve having a round bore, a fixture supporting rod having one end telescopically received and closely fitting within the bore, said end being provided with downwardly facing ratchet teeth forming shoulders on opposite sides of the rod, and a wire spring having inwardly pressed arms

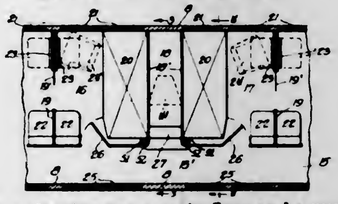
carried in slots in the supporting sleeve and extending across the bore to engage underneath opposite shoulders so that the load carried by the rod is transferred to the sleeve by the arms of the spring subjected to shearing stresses.

2,000,546
PAPER DRYING PROCESS AND APPARATUS
John O. Woodsome, Detroit, Mich.
Application April 18, 1931, Serial No. 531,031
4 Claims. (Cl. 34—48)

1. The method of drying a continuous traveling web of paper, which comprises passing the paper web over heated surfaces in an enclosed space, continuously introducing a stream of relatively cool conditioned air into said enclosed space to travel upwardly at both sides of the traveling web, thereby inducing an outward flow of heated air and water vapor from the immediate vicinity of said heated web into the upwardly traveling stream of conditioned air for admixture therewith, and continuously withdrawing such admixture.



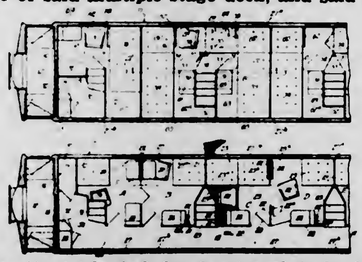
2,000,547
SLEEPING CAR
Arthur H. Woodward, Winnetka, Ill.
Application March 26, 1929, Serial No. 349,976
Renewed October 17, 1932
20 Claims. (Cl. 105—315)



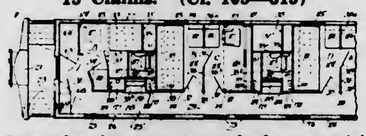
1. In a sleeping car, a main floor and a two stage upper deck, an aisle and a series of compartments on said main floor, a bed in each of said compartments, and a series of compartments on said upper deck each extending over said first named compartments and said aisle, the lower stages of said upper deck lying over said beds and the upper stages thereof lying over the open floor spaces below and said aisle, and beds disposed transversely and lengthwise of the car in said upper compartments on the upper stages of said upper deck over said open floor spaces and aisle, and adjacent to and accessible from a portion of the lower stage of said upper deck.

2,000,548
SLEEPING CAR
Arthur H. Woodward, Winnetka, Ill.
Application March 26, 1929, Serial No. 349,977
Renewed October 17, 1932
24 Claims. (Cl. 105—315)

1. In a sleeping car, a body having a main floor divided into a side aisle and a series of compartments flanking said aisle, a two-stage upper deck roofing said aisle and said compartments, a bed in each of said compartments lying lengthwise of the car, the lower stages of said upper deck lying over said beds and the upper stages thereof lying over the open floor spaces below, and lengthwise beds lying on the upper stages of said upper deck over and within the area of said aisle.



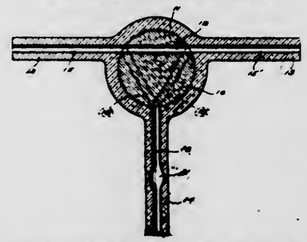
2,000,549
SLEEPING CAR
Arthur H. Woodward, Winnetka, Ill.
Application August 10, 1931, Serial No. 556,113
12 Claims. (Cl. 105—315)



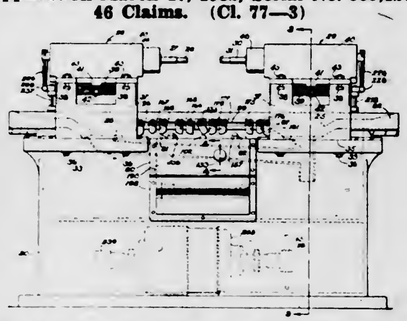
1. In a sleeping car, a main floor and a multiple stage upper deck, an aisle and a series of compartments on said main floor, and a series of compartments on said upper deck each extending over said first named compartments and said aisle, wells arranged between pairs of said compartments on said main floor, a stair in said well leading to said compartments on said upper deck, beds transverse of the car in said compartments on said main floor, the upper stage of said upper deck extending the entire width of the car, beds transverse of the car in said upper compartments on said upper stage of the upper deck over the floor spaces of the compartments on said main floor, and beds in said compartments on said upper stage of the upper deck lengthwise of the car and over said aisle, said stair wells giving access to the transverse and longitudinal beds in said upper compartments through the lower stage of said upper deck.

2,000,550
SLEEPING CAR
Arthur H. Woodward, Winnetka, Ill.
Application August 5, 1932, Serial No. 627,563
11 Claims. (Cl. 105—315)

1. In a sleeping car, a car body comprising a main floor, right and left side walls and a roof, a lengthwise dividing wall adjacent to said right side wall and defining therewith a side aisle extending along the right side of the car body, a plurality of transverse partitions extending from said lengthwise wall to the left side wall of the car body and defining a series of lower compartments, doors leading from said side aisle into said lower compartments, windows in said left side wall opening into said lower compartments, a multiple stage upper deck extending over said lower compartments, a plurality of transverse partitions extending from side wall to side wall of the car body above said upper deck and defining a series of upper compartments, each of said lower compartments having standing room space therein on lower stages of said deck, stairs leading from said side aisle to said upper compartments, windows in said left side wall opening into said upper compartments, extensible beds in a plurality of said lower compartments each comprising a fixed section, and two folding sections, all hingedly connected together and adapted, for night travel, to be extended out to a position lying lengthwise of the car adjacent to the window side of the lower compartment, said fixed section remaining under the adjacent lower stage of said multiple stage deck, and said folding sections adapted, for day travel, to be folded up to a substantially vertical position beneath said lower stage, extensible beds in a plurality of said upper compartments, each comprising a movable section adapted, for night travel, to be extended out into the standing room space of said upper compartment to form a bed lying lengthwise of the car along the left side wall of the car, and adapted, for day travel, to be disposed above an upper stage of said deck, and stationary beds in a plurality of said upper compartments extending transversely of the car and lying on upper stages of said deck.



2,000,551
SLEEPING CAR
Arthur H. Woodward, Winnetka, Ill.
Application August 5, 1932, Serial No. 627,564
15 Claims. (Cl. 105—315)



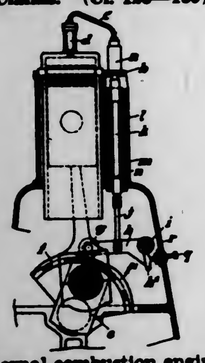
1. In a sleeping car, a car body comprising a main floor, right and left side walls and a roof, a lengthwise dividing wall adjacent to said right side wall and defining therewith a side aisle extending along the right side of the car body, a plurality of transverse partitions extending from said lengthwise wall to the left side wall of the car body and defining a series of lower compartments, doors leading from said side aisle into said lower compartments, windows, in said left side wall opening into said lower compartments, a multiple stage upper deck extending over said lower compartments, a plurality of transverse partitions extending from side wall to side wall of the car body above said upper deck and defining a series of upper compartments, each of said lower compartments having standing room space therein below the upper stages of said deck and each of said upper compartments having standing room space therein on lower stages of said deck, stairs leading from said side aisle to said upper compartments, windows in said left side wall opening into said upper compartments, extensible beds in a plurality of said lower compartments each comprising a fixed section and two folding sections all hingedly connected together and adapted to be folded out to a position extending lengthwise of the car adjacent to the window side of the lower compartment, said fixed section remaining under the adjacent lower stage of said multiple stage deck and said folding sections folding to a substantially vertical position beneath said lower stage, and beds in a plurality of said upper compartments lying on upper stages of said deck and extending transversely of the car.

2,000,552
STOP-COCK
Wladimir M. Zaikowsky, Pasadena, Calif.
Application December 26, 1930, Serial No. 504,790
3 Claims. (Cl. 251—109)

3. A three-way stop-cock including: a barrel having three arms extending from the barrel and in the same plane, forming a T, the two arms of the T forming a straight passageway that intersects the barrel at the ends of a 120° arc, and a stopper having a single, uninterrupted passageway, said passageway intercepting the periphery of the stopper at the ends of a 120° arc.

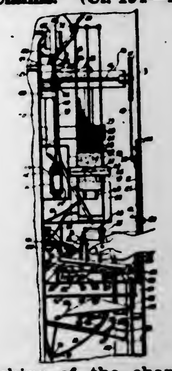
2,000,553
MACHINE TOOL
Carroll R. Alden, Detroit, Mich., assignor to Ex-Cell-O Aircraft & Tool Corporation, Detroit, Mich., a corporation of Michigan
Application March 17, 1932, Serial No. 599,427
46 Claims. (Cl. 77—3)

28. A boring machine comprising, in combination, a base, two axially aligned spindles, means on said base rotatably supporting said spindles fixedly in spaced relation, means for driving said spindles, two fly cutting tools mounted respectively on the adjacent ends of said spindles and projecting from the periphery thereof, one of said tools describing a lesser circle of revolution than the other of said tools, a work carriage mounted on said base in part between said spindles for reciprocation longitudinally of said spindles and adapted to support work with a previously formed hole to be bored, power drive



means for reciprocating said carriage, and control means for said drive means responsive to the variable movement of said carriage through a cycle comprising first successive rapid traverse and feed movements in a roughing stroke in one direction from an intermediate position between said spindles to present said hole to said one tool, then an automatic reversal, then successive rapid traverse and feed movements in a finishing stroke in the other direction past said intermediate position to present said hole to said other tool, then an automatic reversal, and finally a rapid return movement and an automatic stop in said intermediate position.

2,000,554
WINDOW SCREEN
William J. Rasch, Brooklyn, N. Y.
Application July 26, 1934, Serial No. 737,014
6 Claims. (Cl. 156—14)

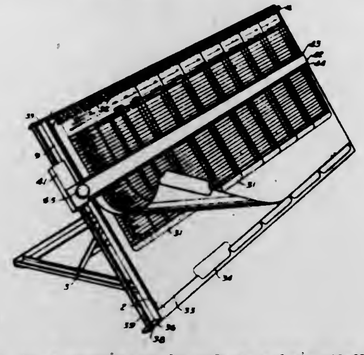


4. As a new article of manufacture, spring brackets shaped to grippingly partly engage the top rail of a lower window sash and a meshed screen yieldingly carried by said brackets of a width and length to close the gap between lower and upper window sash.

2,000,555
DRIVE FOR FUEL PUMPS FOR COMBUSTION POWER ENGINES
Heinrich Becker, Augsburg, Germany, assignor to Maschinenfabrik Augsburg-Nuraberg A. G., Augsburg, Germany, a corporation of Germany
Application December 17, 1930, Serial No. 502,886
In Germany December 20, 1929
4 Claims. (Cl. 123—139)

1. In an internal combustion engine, in combination, a piston and cylinder construction, a crank shaft connected to the piston, a fuel pump having a pump plunger for supplying fuel to the cylinder, a pair of cams on the crank shaft, a cam lever pivotally supported on a fixed axis and adapted to be operated by either of said cams and operably connected to the pump plunger, and means for moving said cam lever along said axis and from one of said cams to the other.

2,000,556
AUTOMATIC DRINK VENDING MACHINE
Thomas Brady, Caldwell, N. J., assignor to Ross M. Turner, New York, N. Y.
Application September 20, 1932, Serial No. 633,942
9 Claims. (Cl. 194—13)



1. In a machine of the character described having a cup dispensing mechanism, a movable cup platform for receiving cups supplied from said cup dispensing mechanism, a mixed drink dispensing mechanism for feeding a mingled charge of liquids into a cup immediately after the latter reaches filling position on said platform, motive means for operating said dispensing mechanisms, a control circuit for said motive means, a switch carried by said cup platform and included in said control circuit, said switch being responsive to movements of said platform for preparing for the closure of said control circuit, means for closing said circuit, also included in said control circuit.

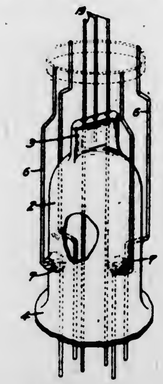
2,000,557
SHINGLE METHOD
Edward J. Buczkowski, Ambler, Pa., assignor, by mesne assignments, to Keasbey & Mattison Company, a corporation of Pennsylvania
Original application December 23, 1930, Serial No. 504,243. Divided and this application December 1, 1932, Serial No. 645,262
3 Claims. (Cl. 18—60)

1. The method of manufacturing decorated shingles comprising forming the shingle of asbestos-cement material in plastic form and with its surfaces preformed, positioning a sheet of molding material on a preformed face of the shingle supported on a flat surface, assembling a number of said superposed shingles and molding means and subjecting the assembly while unheated to pressure to mold the surface of each shingle in correspondence with its molding member holding said pressure during a predetermined initial set and relieving said pressure and said molding means after said initial set and then later completing the setting of said molded cement.

2,000,558
SUMMARY BOARD
George H. Dawson, Chicago, and Paul O. Unger, Glen Ellyn, Ill., assignors to Wilson-Jones Company, Chicago, Ill., a corporation of Massachusetts
Application March 16, 1933, Serial No. 661,080
10 Claims. (Cl. 120—33)

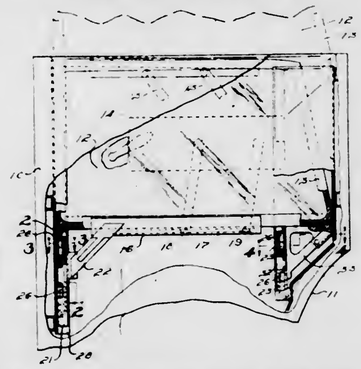
7. In a summary board, a substantially flat plate member, a flat bottomed channel member rigidly secured to said plate adjacent one edge thereof, and a ring bar adapted to fit in said channel, said ring bar provided on its bottom with means for permitting it to lie flat.

9. In a summary board, a rod roughened on a portion of its peripheral surface, a housing mounted on said rod, a line guide secured to said housing, a plurality of rollers in said housing engaging opposite sides of said rod, and a knob mounted on the outside of said housing and adapted to rotate one of said rollers within said housing, to move said housing along said rod.



2,000,559
WETTING PREPARATIONS AND THEIR MANUFACTURE
Charles Dunbar, Middleton, and William Todd, Manchester, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application June 22, 1932, Serial No. 618,689. In Great Britain July 6, 1931
20 Claims. (Cl. 8—20)

2. In a mercerizing process, the step which comprises adding, to a caustic mercerizing liquor, a higher fatty acid, pine oil, and at least one member of the group consisting of cresols and xylenols.



7. A wetting and penetrating composition for use in mercerizing processes which comprises a homogeneous mixture of pine oil, phenols and higher fatty acids.

2,000,560
THERMIONIC TUBE STEM MACHINE
William W. Eitel and Jack McCullough, San Bruno, Calif., assignors to Heintz & Kaufman, Ltd., San Francisco, Calif., a corporation of Nevada
Application December 11, 1933, Serial No. 701,754
12 Claims. (Cl. 49—2)

1. A thermionic tube stem machine comprising a rotating mandrel, adapted to axially position a pinched and flared stem with the pinch adjacent the mandrel, means for heating the stem intermediate the pinch and the flare, means rotating with said mandrel for forming a circumferential series of equally spaced protuberances which may be broken off to provide apertures in the heated area, and means attached to said mandrel for maintaining a plurality of leads in position passing through said apertures while the edges of said apertures are being fused to said leads.

2,000,561
WINDOW SUPPORT
Alfred H. Haberstump, Detroit, Mich., assignor to The Murray Corporation of America, a corporation of Delaware
Application October 14, 1933, Serial No. 693,535
11 Claims. (Cl. 296—48)

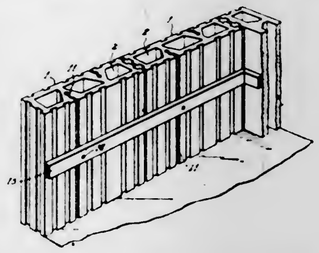
1. A door for a vehicle body having the lower corner thereof cut away, a window glass, a glass-guide channel mounted within the inner confines of the door having less depth at the cut-away corner and having an outer edge substantially parallel to the path of movement of the window glass.

11. A door for a vehicle body having channels at its side edges for encompassing the edges of the window glass, outwardly projecting flanges at the edges of the channels, and means carried by said window glass in engagement with said flanges to prevent the tilting movement of the window longitudinally of its plane of movement.

2,000,562
PROCESS OF REMOVING RESIN FROM SULPHITE CELLULOSE
Gustaf Englund, Stockholm, Sweden, assignor to Patentaktiebolaget Grändal Ramen, Stockholm, Sweden
No Drawing. Application November 20, 1933, Serial No. 698,573. In Sweden July 6, 1933
19 Claims. (Cl. 92—13)

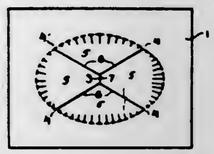
1. The method of removing resin from cellulose pulp which comprises subjecting the pulp to a squeezing operation to force the resin from resin cells in which it is enclosed without causing undesirable breaking of the cell walls, and subjecting the resulting pulp to the action of a de-resining agent.

2,000,563
RADIO TUBE SOCKET
Ralph M. Heintz, Palo Alto, Calif., assignor to Heintz & Kaufman, Ltd., San Francisco, Calif., a corporation of Nevada
Application May 1, 1933, Serial No. 668,779
2 Claims. (Cl. 173—328)



2. In combination with a cylindrical vacuum tube base having contact pins projecting from one end thereof, a socket for said base comprising a plate having a cylindrical aperture adapted to receive said base, a pair of parallel insulating bars attached to said plate, contact strips carried by said bars, each of said contact strips being folded back on itself to form an inner and outer recess, the inner recess being adapted to receive and grip a contact pin when said base is rotated, a spring-retaining pin inserted in said outer recess, a portion of the walls of the outer recess being cut away adjacent the center of said pin, and a coiled spring mounted on said spring-retaining pin in the cut-away portion of said outer recess, the ends of said spring bearing against the sides of said inner recess to increase the pressure on said contact pin.

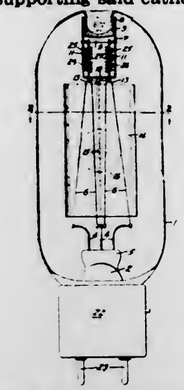
2,000,564
WINDOW CONSTRUCTION
George H. Hovenstein, Detroit, Mich.
Application September 20, 1932, Serial No. 633,997
2 Claims. (Cl. 20—12)



1. In a window construction, a window frame including a frame member and blind stop, the blind stop being provided with a channel adjacent the face of the frame member, a spacing member secured to the top of the frame member and extending into the channel of the blind stop, a sheet metal sash guide secured against the face of the spacing member and a removable resilient cushion member of fibrous material positioned between the sash guide and frame member and extending into the channel of the blind stop and a trim stop secured to the face of the frame member and engaging the cushion member and sash guide to maintain the same in position, said trim stop being removable to allow removal of the cushion member from between the sash guide and frame member, the removal of the cushion member allowing disengagement of the sash guide from the sash and removal of the sash.

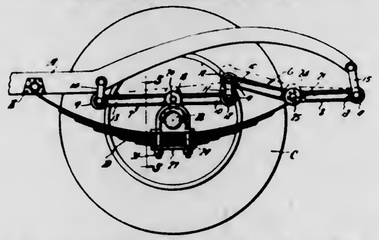
2,000,565
TILE
Henry Jansen, Chicago, Ill., assignor of one-half to George L. Ashline, Chicago, Ill.
Application October 18, 1933, Serial No. 694,081
3 Claims. (Cl. 72—41)

1. A tile block adapted as an anchorage for securing means, a portion of said block forming the side walls of a recess opening into one face thereof, said recess being rectilinear at its outer end and non-rectilinear at its inner end, the cross-sectional dimensions of said recess being slightly less than the diameter of a nail which it is designed to receive.



2,000,566
TOILET SEAT COVER
Ellis Lichtenstein, Woodmere, N. Y.
Application June 27, 1934, Serial No. 732,560
3 Claims. (Cl. 4—243)

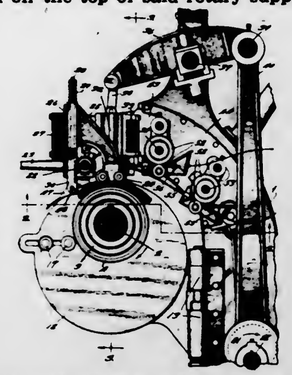
1. A toilet seat cover adapted to fit smoothly over a toilet seat which comprises a sheet of paper having a plurality of radial cuts through the central portion of the sheet forming curtains, and having a plurality of T-shaped perforations arranged in an ellipse around said cuts permitting the said curtains to be dished whereby the curtains may conform to the shape of the seat.



2,000,567
FILAMENT SUPPORT
Jack McCullough, San Bruno, Calif., assignor to Heintz & Kaufman, Ltd., San Francisco, Calif., a corporation of Nevada
Application June 27, 1934, Serial No. 732,643
5 Claims. (Cl. 250—27.5)

1. In combination, a thermionic tube comprising an envelope containing an electrode having a substantially planar face, a filamentary cathode occupying a plane adjacent said face, and a coil spring supporting said cathode, said spring

having oppositely wound portions of substantially equal length.



2,000,568
CHASSIS AND SPRING MOUNTING FOR MOTOR VEHICLES
Arthur Miles, New Port Richey, Fla.
Application July 2, 1934, Serial No. 733,433
3 Claims. (Cl. 267—19)

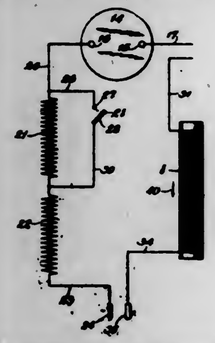
1. In combination with a vehicle chassis, axle and spring, the said spring being connected at one end to the chassis and at its center to the axle, an axle mounting link pivoted intermediate its ends on the axle and connected at one end to the chassis, a spring mounting link connected centrally to the free end of the spring and at one end connected to the chassis, and the other ends of the said links being connected together.

2,000,569
MACHINE FOR MAKING BARRELS
Walter F. Newhouse, Benton Harbor, Mich.
Application February 3, 1933, Serial No. 655,057
37 Claims. (Cl. 1—13.6)

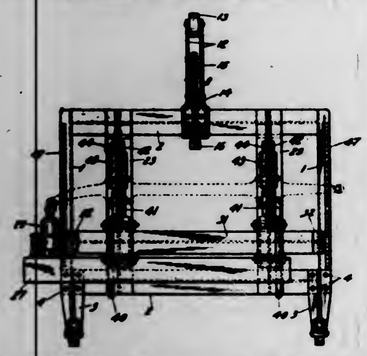
1. In a machine for making cylindrical barrels, the combination of a rotary horizontal shaft provided with a plurality of annular rotary barrel supports adapted to receive a preliminary cylindrical barrel drum thereon, said supports being all of the same diameter, which diameter is less than the inner diameter of the barrel, means for holding the cylindrical upper wall of the barrel drum down upon said barrel supports, so that the axis of said supports is above and in the same vertical plane as the axis of the barrel, means for guiding flat hoop strips to form external hoops of uniform diameter externally of said barrel drum, mechanism for inserting staples downwardly through the hoop strips and the side walls of the barrel drum, with the points of the staples clinched on the top of said rotary supports, and

means for rotating said shaft, thereby to rotate the barrel about the longitudinal axis thereof.

2,000,570
SEPARABLE TUBE CONNECTER
Anthony A. Nina, Philadelphia, Pa., assignor to Television Laboratories, Ltd., San Francisco, Calif., a corporation of California
Application April 26, 1933, Serial No. 668,064
2 Claims. (Cl. 250—27.5)



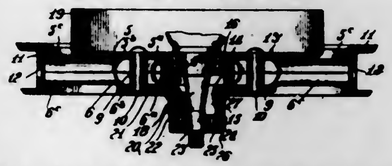
1. A connecter comprising a male member having a substantially flat insulating surface, a contact pin projecting from said surface, a boss projecting from said surface, a contact pin projecting from the end of said boss, a female member comprising a cup-shaped insulating body having a side wall and a surface adapted to contact and support said male member and apertured to receive said first mentioned contact pin, a portion of said surface and said side wall being cut away to receive said boss, and contacts mounted beneath said apertured surface to receive said contacts pins, the portion cut away for said boss being of sufficient size so as to prevent contact between said boss and said body to prevent surface leakage between said contact pins.



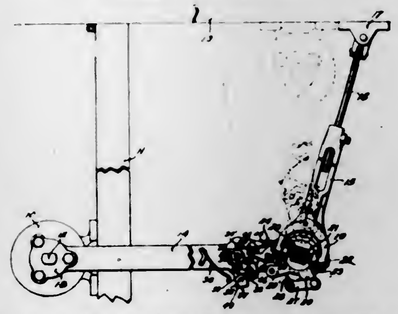
2,000,571
BATTERY RECONDITIONING APPARATUS
Alfred E. Oswald, Hackensack, N. J., assignor to Bates Laboratories, Inc., New York, N. Y., a corporation of New York
Application May 19, 1934, Serial No. 726,435
5 Claims. (Cl. 171—314)

1. In a system for conditioning relatively small light weight dry cell batteries of the type utilized

in connection with hearing aids and of the type having terminal receiving sockets, the combination of, conditioning means having spaced accessible terminals removably and operatively receivable in said sockets, said conditioning means comprising a circuit having polarity indicating means, said circuit adapted to be selectively subjected to alternating or direct current, a pair of predetermined resistances in series disposed in said circuit upon the application of direct current to said circuit, control means for shunting one of said resistances to leave the remaining resistance of said pair in said circuit preparatory to the application of alternating current to said circuit, and a rectifier disposed in said circuit, said pair of resistances and the remaining resistance of said pair having a resistance value to control the flow of current into said battery for supplying the latter with substantially the same amount of current when said circuit is subjected to alternating or direct current.

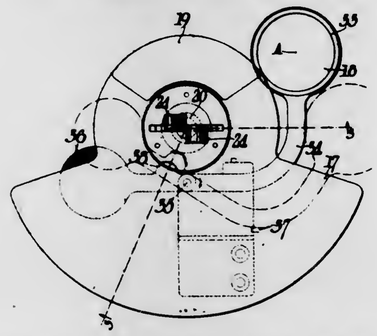


2,000,572
MECHANISM FOR OPERATING UPON AUTOMOBILE AXLES
Roy D. Smith, Davenport, Iowa, assignor to Bee Line Manufacturing Company, Davenport, Iowa, a corporation of Iowa
Application November 10, 1932, Serial No. 641,950
14 Claims. (Cl. 153—32)



1. A structure of the character indicated comprising in combination a frame having a movable beam extending across the frame and supported to move from front to rear thereof and vice versa, said frame including flanged members, hooks engaging said flanged members and sliding on the flanges thereof, and a bar connecting said hooked members in pairs below the slidable beam and supporting said beam from the flanged members when pressure is put upon said beam tending to push it away from the flanged members.

2,000,573
METAL WHEEL
George Spatta, Buchanan, Mich., assignor to Clark Equipment Company, Buchanan, Mich., a corporation of Michigan
Application January 16, 1928, Serial No. 246,926
11 Claims. (Cl. 301—6)

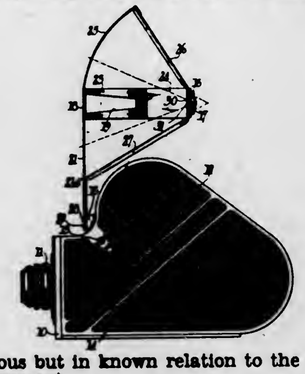


8. A wheel hub structure comprising an inner hub element having a disc portion that bears against the outer surface of a wheel and is provided with an axially disposed annular flange at its inner margin that fits closely within and bears against the inner periphery of an opening in the center of a wheel structure, an outer hub element that bears against the outer surface at the opposite side of the wheel structure and is provided with an axially disposed annular flange at its inner margin and extending outward of the wheel, bearings for said wheel mounted respectively in said flanges, and means extending through the hub elements and the wheel structure for securing the hub elements together and to the wheel structure, one of said hub elements being provided with a braking surface.

2,000,574
DOOR CONTROLLER
Arthur J. Bayley, Milwaukee, Wis.; Allen A. Bayley administrator of said Arthur J. Bayley, deceased
Application December 5, 1932, Serial No. 645,705
9 Claims. (Cl. 189—49)

1. In a door controller the combination of a door closer, door retainer mechanism, means responsive to manipulation of the door for rendering said mechanism effective to lock the door against closing, said mechanism being releasable in response to other manipulation of the door, and temperature responsive means for rendering said mechanism ineffective to thereby render said closer effective to close the door in the event of fire.

2,000,575
SAFETY SHUTTER FOR MOTION PICTURE PROJECTORS
Maurice G. Blank, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
Application March 28, 1933, Serial No. 663,119
4 Claims. (Cl. 88—19.4)



1. A safety shutter for motion picture projectors including in combination, a pivotally mounted safety shutter, a weight attached thereto to incompletely counter-balance the shutter whereby it normally moves on its pivot to an inoperative position, a governor mounted on a power driven shaft, said governor comprising weighted levers pivoted to said shaft, a cam disc mounted to slide axially of said shaft, a spring tending to move said cam disc in one direction said weighted levers being adapted to move said cam disc in an opposite direction whereby said cam may contact with said safety shutter only as the speed of the power driven shaft decreases and said cam disc may then be moved by the spring into position to engage and move the safety shutter.

2,000,576
MORDANT
Ernest R. Boller, Cleveland Heights, Ohio, assignor to The Grasselli Chemical Company, Cleveland, Ohio, a corporation of Delaware
No Drawing. Application March 1, 1934, Serial No. 713,532
7 Claims. (Cl. 41—42)

5. In a process of engraving the step comprising etching metal with a mordant comprising nitric acid and no more than about six and seventy five hundredths per cent by weight of ammonium sulfate, based on 40° Bé. nitric acid.

2,000,577
DIRECT VIEW FINDER
Joseph L. Boon, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
Application November 15, 1933, Serial No. 698,113
11 Claims. (Cl. 33—64)

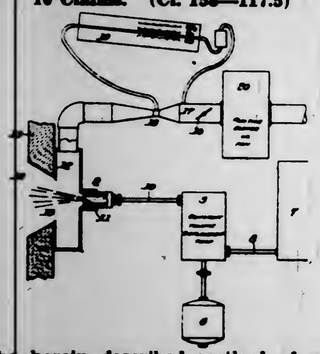
1. A finder for observing a moving object and for attachment to an instrument having an optical system with a definite field, comprising a rear sight provided with an opening, and a front sight provided with one opening which together with the opening in said rear sight define the definite field of the instrument, said finder also being provided with an additional opening displaced from and in predetermined relation to the opening in said front sight and which together with the opening in said rear sight defines a field extraneous but in known relation to the field of the instrument.

2,000,578
PYRIDINIUM IODIDES AND PROCESS OF PREPARING THEM
Leslie G. S. Brooker, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Original application January 16, 1933, Serial No. 652,030. Divided and this application November 7, 1933, Serial No. 697,067
6 Claims. (Cl. 260—41)

4. The process which comprises condensing pyridine with a 2-iodopyridine alkyl iodide.

2,000,579
MILK TESTING DEVICE
Claude H. Carpenter and Charles M. Derby, Frewsburg, N. Y.
Application September 20, 1934, Serial No. 744,858
8 Claims. (Cl. 73—51)

8. A testing device of the character described including a tubular body having an inlet, the lower end of said body being adapted to be immersed in the liquid to be tested, a member carried by the lower end of said body, said member having an opening, a plunger within said body for drawing liquid thereinto through said inlet and for discharging it from said body through said opening, a filter element carried by said member through which the liquid passes as it is discharged from said body, a lever pivotally



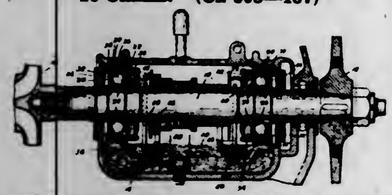
mounted upon the upper end of said body at a point which is located above the level of the liquid when the lower end of the said body is immersed as described, a rod connecting said member and said lever, said lever being movable in one direction to move said member so that said filter element may be removed and being operative upon movement in the opposite direction to return said member to its original position, said rod having a curved resilient section and being of such a length that during the initial part of the return movement of said lever said member is returned to its original position and during the final part of the return movement of said lever said curved portion is flexed and said lever engages said body, said rod passing beyond the pivotal mounting of said lever in the direction of said body as the curved portion of said rod is flexed and as said lever engages said body, thereby locking said member in said original position.

2,000,580

ART OF COMBUSTION OF LIQUID FUELS

Eben H. Carruthers, Ithaca, N. Y., assignor to United Furnace Engineering Company, Inc., New York, N. Y., a corporation of Delaware

Application May 19, 1931, Serial No. 538,453
10 Claims. (Cl. 158—117.5)



1. The herein described method of effecting combustion of a liquid fuel which consists in producing a flow of the liquid at a constant flow rate while subjected to high pressure at or above substantially 1000 pounds per square inch, atomizing said liquid by said pressure prior to its mixture with air, and then mixing air and the atomized liquid in predetermined proportions and igniting the mixture.

2,000,581

LUBRICATED BEARING

Joel S. Coffin, Jr., Englewood, and Eugene L. Scheltema, Ridgewood, N. J., assignors to C-S Engineering Company, Englewood, N. J., a corporation of Delaware

Application March 9, 1933, Serial No. 660,128
16 Claims. (Cl. 308—187)

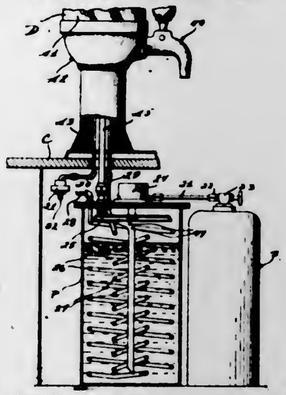
1. The combination of a shaft and an antifriction bearing therefor having a filter in one end thereof, and means for forcibly introducing a lubricating fluid into and through said filter and into one end of the bearing and for forcibly expelling the lubricating fluid from the filter and from the other end of the bearing.

2,000,582

COMPOSITION FOR STORAGE BATTERY CONTAINERS

Edward R. Dillehay, Glen Ellyn, and Oliver O. Rieser, Oak Park, Ill., assignors to The Richardson Company, Lockland, Ohio, a corporation of Ohio

No Drawing. Application September 13, 1930, Serial No. 481,801
10 Claims. (Cl. 106—31)



1. In a process for the manufacture of bituminous compositions, a binder forming step comprising the initial maintenance of an asphalt component at a temperature to produce a certain viscosity, and the initial maintenance of a coal tar pitch component at a different temperature, to secure the same viscosity therein, and the mixing of the components together while at the same viscosity.

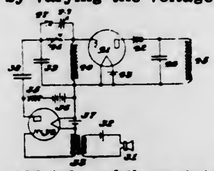
2,000,583

BEVERAGE DISPENSING APPARATUS

William E. Doughty, Detroit, Mich., assignor to James Vernor Company, Detroit, Mich., a corporation of Michigan

Application March 8, 1933, Serial No. 660,047
13 Claims. (Cl. 225—21)

1. In a liquid dispensing apparatus, a display chamber, a pre-cooling chamber, a source of liquid supply, a cooling unit in said display chamber, a cooling unit in said pre-cooling chamber, means for connecting said source of supply to said pre-cooling chamber, means for conducting liquid from said pre-cooling chamber to said display chamber, and means for circulating refrigerant through said cooling units.



2,000,584

FREQUENCY CONTROL

Carl Fichandler, New York, N. Y.

Application October 5, 1931, Serial No. 567,120
18 Claims. (Cl. 179—171)

5. The method of modulating the frequency of an electric wave in a radio frequency circuit having resistive and reactive components which comprises reactively coupling said circuit to the plate circuit of a thermionic tube, and varying said reactive component by varying the plate resistance of the tube by varying the voltage impressed on

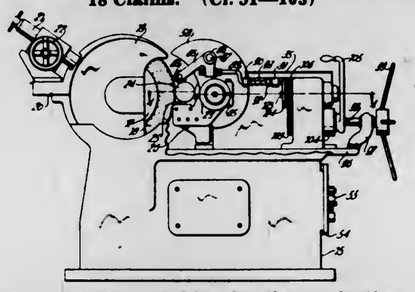
the grid of said tube while maintaining the resistive component of the total effective circuit impedance substantially constant.

2,000,585

ELECTROMAGNETIC IMPULSE CLOCK

Jean Fink, Waltham, Mass., assignor to Waltham Watch Company, Waltham, Mass., a corporation of Massachusetts

Application August 23, 1932, Serial No. 630,026
13 Claims. (Cl. 58—41)



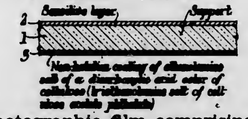
1. In a clock impeller of the character described, an electromagnet having oppositely disposed poles, an armature rotatably mounted on an axis midway between said poles and having arms of greater length than width extending oppositely from the axis, a switch carrier secured to the staff of said armature to be carried and rotated thereby, a spiral spring coiled around the axis of said armature coupled at one end to said switch carrier and anchored at its opposite end, and an enclosed mercury switch or circuit breaker mounted on said switch carrier to be tilted with rotation of the carrier and having separated terminal contacts at one end, one of said contacts being in electrical connection with the spring.

2,000,586

GRINDING MACHINE

Adolph W. Foerster, Detroit, Mich., and Clement Booth, Cincinnati, Ohio, assignors to Cincinnati Grinders Incorporated, Cincinnati, Ohio, a corporation of Ohio

Application September 15, 1932, Serial No. 633,326
18 Claims. (Cl. 51—103)



17. A grinding machine for the production of work pieces of substantially elliptical form in cross section including a rotatably mounted grinding wheel and an opposed backing member forming with the grinding wheel a grinding throat for reception of a work piece of flaring form above and below the proximate portion of the surfaces of the grinding wheel and backing member, means for maintaining the grinding wheel and backing member in substantially fixed relation, one to the other, during performance of a grinding operation on an individual work piece, and means for rotatably supporting a work piece with its periphery jointly engaging the grinding wheel and backing member, and means for effecting a definite series of sequential movements of an individual work piece toward and from the narrowing portion of the grinding throat in timed relation with the rotation of the work piece whereby a predetermined elliptical contour will be produced on the periphery of the work piece.

2,000,587

PHOTOGRAPHIC FILM

Charles R. Fordyce, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York

Application November 18, 1933, Serial No. 698,664
9 Claims. (Cl. 95—9)

1. A photographic film comprising a cellulose derivative base, a light sensitive emulsion thereon and, upon at least one side of said film, a coating comprising a water-soluble ethanolamine salt of a dicarboxylic acid ester of cellulose.

2,000,588

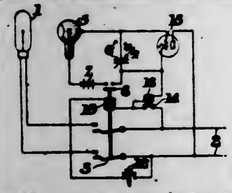
CAMERA CONSTRUCTION

Carl C. Fuerst, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York

Application August 11, 1934, Serial No. 739,457
9 Claims. (Cl. 95—31)

1. In a camera, the combination with a body portion, of a roll holder adapted to slide into and out of the body portion for loading the camera, a rear wall on the body, an exposure frame carried by the roll holder, and a plurality of parallel film guiding ribs carried by the camera back and extending transversely of the exposure frame adapted to hold spaced areas of a film toward the exposure frame.

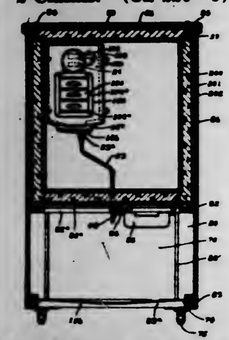
2,000,589



EXPOSURE CONTROL APPARATUS

Albert B. Fuller, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York

Application August 10, 1931, Serial No. 556,199
3 Claims. (Cl. 250—41.5)

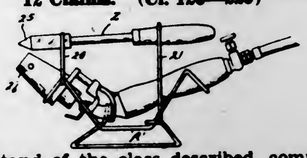


1. The combination with an electric circuit, a photographic lamp in said circuit, a switch for making and breaking said circuit, a light sensitive element the conductivity of which varies with the intensity of said lamp, a capacity in series with a battery and said element, means

for closing the battery circuit when said lamp is energized and means controlled by the charge

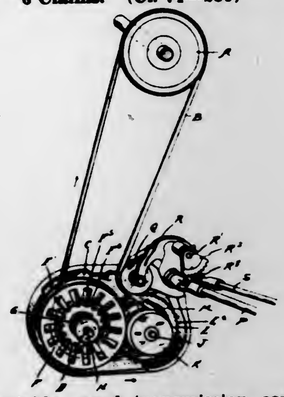
on said capacity for opening the lamp circuit, said capacity being selectively variable.

2,000,590
REFRIGERATING APPARATUS
Herbert George, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application April 30, 1929, Serial No. 359,400
2 Claims. (Cl. 220—9)



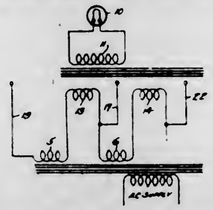
1. A refrigerator cabinet including a framework, a box-like sheet metal food compartment supported by said framework, the framework including frame pieces extending along and beyond the corners of the food compartment to form rectangular recesses on the outer surface of said compartment, a layer of bituminous cement on the outer surface of said food compartment in said recesses, a layer of compressed baked rock wool in each of said recesses with its fibres individually sized with asphaltic material, means for hermetically sealing said layers, and an outer metallic casing supported by said framework.

2,000,591
SHOE ATTACHMENT FOR ARCH SUPPORTS
George W. Grabb, Sharpsburg, Pa., assignor of one half to Ross T. Scully, Pittsburgh, Pa.
Application December 30, 1931, Serial No. 583,821
4 Claims. (Cl. 36—71)



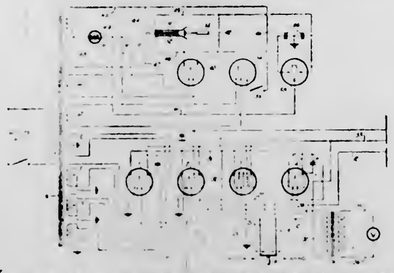
1. The combination with a shoe and a freely separable arch support having one end thereof abutting the rear wall of said shoe and the other end freely slidable therein, of an attachment therefor comprising a metal plate having an edge formed with an upturned flange and secured to the shoe immediately below the free end of the said support for receiving and sliding the same with the flange arranged adjacent a portion of the vamp.

2,000,592
SUPPORT
Eugene Greenfield and Federico J. Thibault, Detroit, Mich., assignors to Liquefied Gas Development Company, Detroit, Mich., a corporation of Michigan
Application February 8, 1933, Serial No. 655,820
12 Claims. (Cl. 126—229)



1. A stand of the class described, comprising an arched base, a cradle for receiving and supporting a blow torch extending across and secured to said base, and means projecting from the base into the cradle for holding the blow torch against accidental displacement.

2,000,593
VARIABLE SPEED TRANSMISSION
Albert Happel, Toledo, Ohio, assignor to Kent-Owens Machine Company, Toledo, Ohio, a corporation of Ohio
Application August 14, 1933, Serial No. 685,106
6 Claims. (Cl. 74—236)

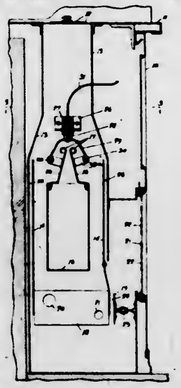


1. A variable speed transmission comprising a gear train including a planetary transmission, grooved pulleys connected to said gear train in driving relation to two members of said planetary transmission and so arranged that they rotate in a common plane, one of said pulleys being provided with opposed conical side sections located upon opposite sides of said plane and axially adjustable in relation to it and to each other, resilient means for forcing said side sections towards each other, a belt having its path of travel confined in said plane and forming a driving connection between said pulleys, and means rockably mounted in the aforesaid plane for varying the ratio of tension of said belt to said resilient means to balance the same in different positions of radial adjustment with respect to the axis of the pulley with the adjustable side sections to thereby change the ratio of said gearing.

2,000,594
TESTING DEVICE
Thomas E. Hodgkinson, San Francisco, Calif., assignor to Newton J. Hale, San Francisco, Calif.
Application July 1, 1931, Serial No. 548,082
Renewed October 22, 1934
10 Claims. (Cl. 175—183)

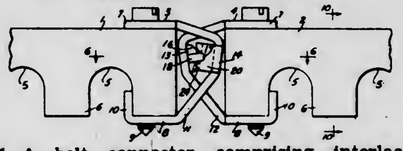
1. In a device of the class described, a single source of current, a series of three or more leads associated therewith, a closed indicating circuit, and means controlled by passage of current between any combination of said leads for inducing current in said indicating circuit.

2,000,595
APPARATUS FOR ELECTRICAL TESTING
Roy O. Hurd and Thomas E. Hodgkinson, San Francisco, Calif., assignors to Newton J. Hale, San Francisco, Calif.
Application July 1, 1931, Serial No. 548,069
Renewed October 16, 1934
5 Claims. (Cl. 250—27)



1. In a vacuum tube testing apparatus, means for audibly simulating the effect of a defective tube's operation in a radio receiving set comprising audible reproducing mechanism, means for prolonging the effect of transient impulses in a tube, comprising an oscillatory circuit cooperatively associated therewith, and means for rectifying and conveying to said mechanism oscillations produced by defects in a tube under test.

2,000,596
PREPARATION OF LACTYL CELLULOSE ESTERS
William O. Kenyon and Russel H. Van Dyke, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application December 14, 1932, Serial No. 647,213
3 Claims. (Cl. 260—101)



1. The process of preparing a mixed ester of cellulose which comprises submitting a cellulose ester containing a fatty acid radical, an alpha-hydroxy acid radical and a free and esterifiable hydroxyl group to the action of a dicarboxylic acid anhydride and a tertiary organic base.

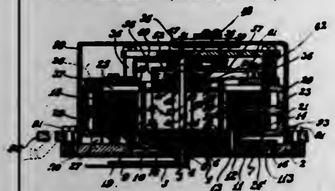
2,000,597
AIR DISTRIBUTION UNIT
Robert E. Keyes, Dedham, Mass., assignor to B. F. Sturtevant Company, Inc., Boston, Mass.
Application January 17, 1934, Serial No. 707,000
9 Claims. (Cl. 257—8)

1. A combined heating and cooling unit comprising a cold air compartment, an injector nozzle connected with said compartment, a heater below said compartment, an opening in said unit for the reception of recirculated air, a recirculated air passage connecting with said opening, passing through said heater, around said compartment, and in injector relationship past said nozzle, and a second recirculated air passage by-passing said heater and surrounding said first air passage in the area where same passes said compartment.

2,000,598
BELT CONNECTER
Edward H. Kremer, Dayton, Ohio, assignor to The Dayton Rubber Manufacturing Company, Dayton, Ohio, a corporation of Ohio
Application January 17, 1934, Serial No. 706,977
18 Claims. (Cl. 24—33)

1. A belt connecter comprising interlaced clamping members having pintle members arranged therebetween, one of said pintle members having a groove, the other pintle member having a rib engaging said groove, said rib extending beyond the body of its pintle member.

2,000,599
METHOD OF STRENGTHENING STRUCTURAL MEMBERS
Arthur G. Leake, Bridgeport, Conn.
Application December 30, 1931, Serial No. 583,815
3 Claims. (Cl. 29—150)



1. The method of strengthening structural members secured by rivets which comprises removing the heads of the rivets on one side of a member while the member is in position in a built up structure of structural members, placing a reinforcing plate member provided with openings with a spacing corresponding with the

spacing of the rivets against the first member over the rivet shanks, welding the plate member to the shanks through the openings by add-

ing weld metal to the shanks and the sides of the openings to build up the shanks, and welding edges of one of the members to the other member.

2,000,600
ELECTRIC CLOCK
Fritz Loeffler, Yonkers, N. Y.
Application September 25, 1930, Serial No. 484,330
Renewed October 6, 1934
27 Claims. (Cl. 185—40)

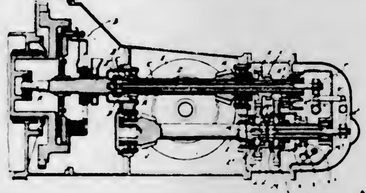
1. In a clock driving mechanism, a motor having a rotor, a load shaft and a contactor or control switch, said switch comprising a first means for initially causing the rotor to revolve through a predetermined angle, and a second means, responsive to rotation of said load shaft through a definite predetermined angle but always less than 360° for controlling said first means.

2,000,601
PRECIPITATION OF CELLULOSE ESTERS
Carl J. Malm and Charles B. Ferdyce, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application July 28, 1931, Serial No. 553,646
9 Claims. (Cl. 260—102)

1. A process of separating an acetyl-containing fatty acid ester of cellulose from the solvent in which it is dissolved which comprises introducing that solution into a precipitating bath comprising acetic acid and an ether containing an alkyl radical having from 3 to 5 carbon atoms inclusive.

2,000,602
PROCESS FOR THE FIBROUS ESTERIFICATION OF CELLULOSE
Carl J. Malm and Charles L. Fletcher, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application February 2, 1932, Serial No. 590,509
11 Claims. (Cl. 260—101)

1. The fibrous esterification of cellulosic material in a bath containing as a catalyst, perchloric acid and a sufficient amount of an aliphatic ether having a boiling point above 70° C. to prevent solution of the ester formed therein.



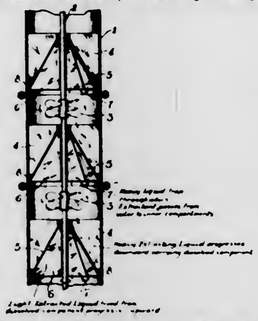
2,000,603
TREATMENT OF CELLULOSIC MATERIAL PRIOR TO ESTERIFICATION
Carl J. Malm and Charles B. Ferdyce, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application February 18, 1932, Serial No. 593,870
12 Claims. (Cl. 260—101)

1. The preparation of cellulose for esterification which comprises pretreating it with a bath containing liquid sulfur dioxide as the principal active pretreating agent preliminary to the application of esterifying reagents thereto.

2,000,604
MANUFACTURE OF ALKOXYACETALDEHYDES AND ALKOXYACETIC ACIDS
Carl J. Malm, Gale F. Nadeau, and Norman F. Diesel, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application September 18, 1933, Serial No. 689,894
12 Claims. (Cl. 260—116)

1. Two-stage oxidation of a lower alkyl monoether of ethylene glycol to an alkoxyacetic acid, comprising the catalytic, vapor-phase oxidation of the alkyl monoether of ethylene glycol to the corresponding alkoxyacetaldehyde and the catalytic, liquid-phase oxidation of the alkoxyacetaldehyde to the corresponding alkoxyacetic acid.

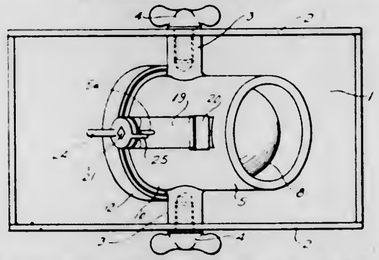
2,000,605
TRANSMISSION MECHANISM
Alfred Moorhouse, Detroit, Mich.
Application August 14, 1933, Serial No. 685,095
3 Claims. (Cl. 74—326)



1. The combination of a pair of parallelly arranged shafts, one of which is tubular, a shaft having its axis transverse to the axes of said parallel shafts and intermediate the same, a ring gear on the latter shaft, pinions on said parallel shafts intermeshing with said ring gear on opposite sides of the axis thereof, a drive shaft passing through said tubular shaft and projecting beyond the same, variable speed gearing between the projecting portion of said drive shaft and the other of said parallel shafts for imparting thereto different angular speeds less than that of the drive shaft and means for directly clutching said drive shaft to the end of said tubular shaft opposite that carrying said pinion to transmit to the latter the same angular speed.

2,000,606
COUNTER CURRENT LIQUID EXTRACTION APPARATUS
Donald F. Othmer, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
Application May 27, 1930, Serial No. 456,272
3 Claims. (Cl. 23—270)

1. A counter current liquid extraction apparatus comprising a vertically disposed con-

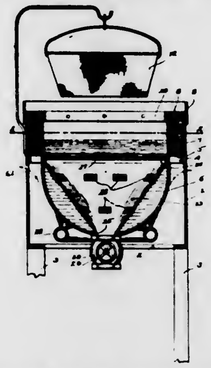


CARNEGIE LIBRARY OF ATLANTA

tainer through the center of which extends a rotatable shaft to which is fixed an agitating device, and in proximity thereto fins radiating from the outer and inner surfaces of a cone, located in the container, whereby compartments

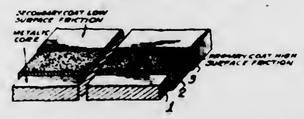
are formed, passages inter-connecting the outer compartments formed by said outwardly radiating fins, and a liquid trap permitting liquids to flow from the outer to the inner surface of the cone, and another passage from the inner to the outer surface of the cone.

2,000,607
GAS CANNON
Edward Sutton Peake, Westerville, Ohio, assignor to The Kilgore Manufacturing Company, Westerville, Ohio, a corporation of Ohio
Application May 12, 1932, Serial No. 610,751
8 Claims. (Cl. 42—55)



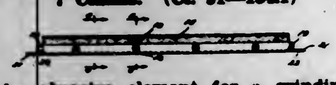
2. In combination in a gas cannon, an ammunition means comprising an ammunition storage chamber for storing an ammunition strip, means for feeding said strip and means for shearing portions of said strip and ejecting the sheared portions to the cannon.

2,000,608
GRINDING MACHINERY
Willetts Peaslee and Lester F. Nenninger, Cincinnati, Ohio, assignors to Cincinnati Grinders Incorporated, Cincinnati, Ohio, a corporation of Ohio
Application April 5, 1933, Serial No. 664,571
14 Claims. (Cl. 51—49)



10. In a work supporting mechanism for use with machine tool organizations the combination with a bed having formed thereon guideways, of a housing or bracket having cooperating guideways mounted on the bedways, a pair of contact shoes carried by the bracket for movement relative thereto into engagement with the work, manual means for initially adjusting the positions of the shoes, power means for modifying the position of one of said shoes, means for clamping the housing to the bed, and means for translating the housing relative to the bed when un-clamped.

2,000,609
FRYING KETTLE
John C. Pitman, Saugus, Mass.
Application August 6, 1927, Serial No. 211,037
2 Claims. (Cl. 53—7)

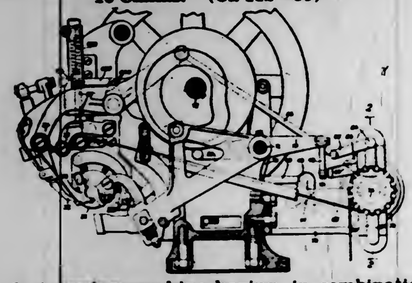


1. In a device of the character specified the combination of a kettle, means for applying heat to the bottom portion of said kettle and a funnel shaped member mounted within said kettle, the top rim of said funnel shaped member being arranged to contact loosely with the inside of the wall of the kettle, at a point substantially below the surface level of an operative charge of the cooking liquid, said funnel shaped member being provided with an upper row of holes in the upper portion thereof and with a lower row of holes in the lower restricted portion thereof.

2,000,610
PACKAGE BINDER
Howard C. Porter, La Grange Park, Ill., assignor to Signode Steel Strapping Company, Chicago, Ill., a corporation of Delaware
Application July 11, 1932, Serial No. 621,844
10 Claims. (Cl. 24—20)

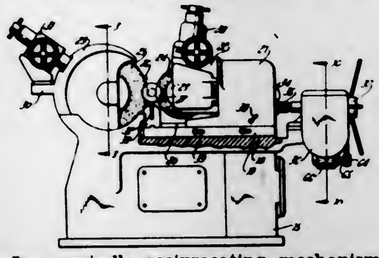
1. A package-binder adapted to be tensioned about packages and made into a permanently closed loop thereabout by a folded joint between overlapping portions, comprising a flexible metallic core having a surface of high coefficient of friction, and a coating of relatively low coefficient of friction which is normally over said surface but disposable to expose said surface of high coefficient of friction in the folded joint.

2,000,611
ABRASIVE STONE HOLDER
Maurice N. Frango, Detroit, Mich.
Application March 12, 1934, Serial No. 715,238
7 Claims. (Cl. 51—134.1)



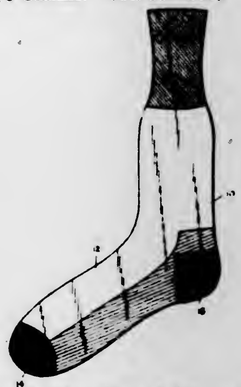
1. An abrasive element for a grinding tool comprising a channel member provided with apertures in the side flanges thereof, and an abrasive stone secured in said channel and having portions thereof projecting into said apertures.

2,000,612
WIRE BRUSH MOUNTING
Rudolph E. Radimer, Avon Lake, Ohio
Application September 4, 1934, Serial No. 742,644
2 Claims. (Cl. 15—179)



1. A brush comprising a pair of side plates, a boss on the inner side of each side plate, said boss having a central opening and an inwardly projecting circular flange around said opening, forming a bearing, a sleeve between the plates, said sleeve having inturned ends rigidly engaged with the periphery of the boss, and brush material clamped between the plates.

2,000,613
SEWING MACHINE
Fred Hicks, Harold Ernest Elliott, and Frank Coleman Chelce, Leicester, England, assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application October 25, 1933, Serial No. 695,140
In Great Britain November 4, 1932
16 Claims. (Cl. 112—59)



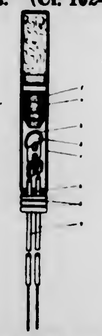
1. A sewing machine having, in combination, stitch forming devices, a thread tension wheel, a rotatable member, a spring yieldingly holding the member from rotation and tensioned by rotation of the member, and means for clutching and unclutching the tension wheel and member during each stitch forming cycle to cause the member to be rotated with the wheel against the force of the spring by a pull on the thread and to be returned independently of the wheel.

2,000,614
GRINDING MACHINE
Erwin G. Roehm, Norwood, Ohio, assignor to Cincinnati Grinders Incorporated, Cincinnati, Ohio, a corporation of Ohio
Application November 22, 1933, Serial No. 699,203
17 Claims. (Cl. 51—103)

1. In a spindle reciprocating mechanism of the class described the combination of a housing having bearings formed therein, a spindle mounted in said bearings for rotation and axial movement relative thereto, means for effecting said axial reciprocation of the spindle, means for varying the rate of said reciprocation, and means for effecting a dwell at each end of said reciprocation.

2,000,615
HOSIERY
Chester H. Roth, New York, N. Y.
Application March 4, 1935, Serial No. 9,131
6 Claims. (Cl. 66—202)

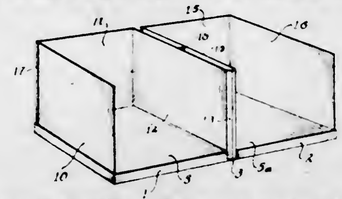
1. A stocking comprising a leg portion of silk and a foot extremity portion consisting of a composite knit material of greater strength and durability, said knit material in the foot extremity portion consisting of knit threads of mercerized cotton and linen threads in each course in such proportions that said foot-extremity portion is substantially as soft and pliable as said leg portion.



2,000,616
BRICK FACING SUPPORT
Stjepan Sarar, Detroit, Mich.
Application November 21, 1934, Serial No. 754,006
5 Claims. (Cl. 72—0.5)

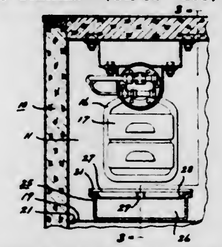
1. The combination with a previously formed wall of cellular nature having a horizontal series of openings therein, of a concrete ledge extending outwardly along the outside surface of said wall, said ledge having integral projecting portions extending into said openings and uniting said ledge with said wall, reinforcing elements imbedded within the said projecting portions,

reinforcing elements imbedded within said ledge, and means uniting the reinforcing elements in the ledge with the reinforcing elements in the projecting portions.



2,000,617
ELECTRIC TIME FUSE
Konrad Schaffler-Glösal, Vienna, Austria
Application February 21, 1933, Serial No. 657,780
In Austria June 17, 1932
4 Claims. (Cl. 102—10)

1. An electric time fuse comprising in combination a fuse case open at one end and closed at the other end, lead-in wires, a plug of yielding material longitudinally traversed by the said lead-in wires and adapted to form a closure of the open end of the said case without any leakage, an electrically fired match head attached to the said wires and coated exteriorly with a mixture of metal powder and an oxygen carrier, a charge of a retarding composition composed of iron particles coated with a neutral phlegmatizing substance and mixed with an oxygen carrier, a shell containing the said retarding composition closely fitting within the said fuse case and having its end nearest to the said match head taperedly reduced in thickness of wall, and a priming charge located between the outer end of the said shell and the closed end of the fuse case, substantially as and for the purpose specified.



2,000,618
COLLAPSIBLE TWO-ROOM DOLL HOUSE
Carl A. Schultz, Joliet, Ill.
Application May 9, 1934, Serial No. 724,657
3 Claims. (Cl. 46—37)

1. A collapsible doll house consisting of a plurality of hinged wall members which can be folded against each other, a box container having a hinged cover, said container when open being employed as a base for the said doll house, two floor members in said container sections, upright supporting members hinged at the ends of each of the said floor members, a spacing member hinged on said floor members, a vertical spacing member hinged on the side of one of the center walls to be wedged against the opposite center

wall thereby making the entire structure rigid, substantially as described.

2,000,619
REFRIGERATING APPARATUS
Sylvester M. Schweller, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application April 25, 1932, Serial No. 607,327
9 Claims. (Cl. 62—103)

7. The combination with a refrigerator cabinet including a compartment having a cooling unit of a refrigerating system disposed therein, a substantially closed container disposed below and in spaced relation to said cooling unit within the refrigerator compartment, a flange extending upwardly from the top of said closed container providing a receptacle for receiving drip water from said cooling unit, conduit means for conducting the drip water from said receptacle to said container, and said container being removable from said refrigerator compartment while said cooling unit is positioned therein.

2,000,620
HYDROLYSIS OF CELLULOSE ESTERS
Cyril J. Staud and Louis M. Minsk, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application February 17, 1932, Serial No. 593,684
20 Claims. (Cl. 260—102)

1. The hydrolysis of an organic ester of cellulose in a hydrolyzing bath essentially consisting of a phenol and a basic nitrogen compound.

2,000,621
PROPIONATION OF CELLULOSIC MATERIAL
Cyril J. Staud and Russel H. Van Dyke, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application January 14, 1933, Serial No. 651,856
8 Claims. (Cl. 260—101)

1. The process of preparing a propionyl-containing ester of cellulose which comprises propionating cellulosic material in a bath contain-

ing propionyl groups and an impelling anhydride in the presence of a catalyst consisting of sulfur dioxide and an oxide of nitrogen of which the oxygen constitutes more than 50% by weight of the compound.

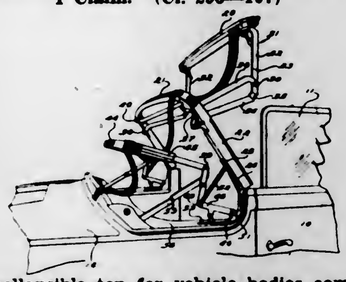
2,000,622
CELLULOSE ACETATE COMPOSITION COMPRISING A TERTIARY ALCOHOL
Ernest E. Taylor, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New York
No Drawing. Application February 2, 1932, Serial No. 590,510
2 Claims. (Cl. 106—40)

1. A composition of matter comprising cellulose acetate dissolved in a solvent consisting of propylene chloride and a substantial proportion of a tertiary alcohol containing less than 6 carbon atoms.

2,000,623
APPARATUS FOR MOLDING CERAMIC STRUCTURES
William Taylor, Toronto, Ontario, Canada, assignor to James M. Teahan, Detroit, Mich.
Application July 20, 1931, Serial No. 551,987
4 Claims. (Cl. 25—129)

1. An apparatus for molding clay comprising porous mold sections cooperating to define a predetermined mold cavity corresponding to the external surface of the article to be molded, a core formed of non-porous non-absorbent material located within said mold cavity and a guide for positioning said core imbedded in one of said mold sections.

2,000,624
CHAIR
Harry G. Traver, Beaver Falls, Pa.
Application October 25, 1932, Serial No. 639,415
9 Claims. (Cl. 155—53)

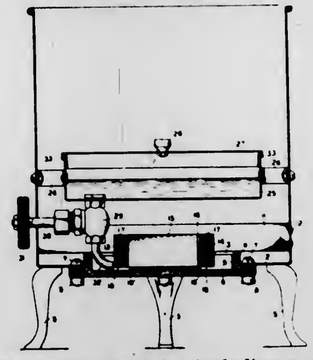


1. In a chair, a pair of members of resilient material and of ogee form, means connected intermediate the ends of and supporting said members with one end portion of said members extending upward and the other end portion curved downwardly to serve as arm rests, bars connected to the opposite ends of and spacing said members, and a flexible unitary seat and back rest suspended from the bars.

2,000,625
MEASURING INSTRUMENT
John F. Vaughan, Belmont, Mass.
Application May 16, 1934, Serial No. 725,925
8 Claims. (Cl. 33—141)

1. A measuring instrument for making measurements on maps and the like, comprising a supporting frame, a flexible, endless measuring band, the frame and band being provided with cooperating indicating devices, rotatable means carried by the frame for supporting the band, said means including a rotatable guide having a band-guiding face on its periphery to guide the band, with the outer face thereof extending beyond the periphery of the guide to permit the band to be applied to the map along the path to the barrel pointing to the front. The instrument be measured, thereby to cause movement of the band with respect to the frame to indicate the distance measured.

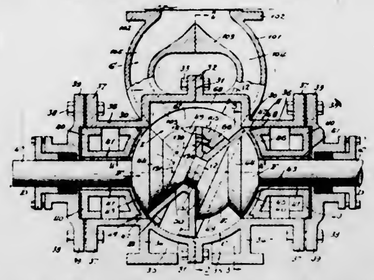
2,000,626
VEHICLE BODY AND TOP CONSTRUCTION
John Votypka, Detroit, Mich., assignor to Lebaron Detroit Company, Detroit, Mich., a corporation of Michigan
Application April 28, 1930, Serial No. 448,015
1 Claim. (Cl. 296—107)



A collapsible top for vehicle bodies comprising a top supporting bow normally arranged in an upright position and having the ends of the vertical leg portions thereof pivotally connected to opposite sides of the body, a second top supporting bow also carried by the body and

positioned rearwardly from the bow aforesaid, means connecting the second bow to opposite sides of the body including links having their adjacent ends pivotally connected together and having their opposite ends respectively pivotally connected to the free ends of the bow and to the body, said links normally being in alignment with the free end portions of the bow to form extensions of the latter and being of sufficient length to permit collapsing the bow into a space of substantially smaller area than the area normally defined by the bow and links, a lever having the rear end pivotally connected to the lowermost link forming a part of the second-mentioned bow and having the forward end pivotally connected to the first-mentioned bow, a second lever having the forward end pivotally connected to the link adjacent the lowermost link aforesaid and having the rear end thereof pivotally connected to the body whereby collapsing of the first-mentioned bow automatically effects a folding of the links forming a part of the second-mentioned bow.

2,000,627
PROCESS FOR SIMULTANEOUSLY PRODUCING PHOSPHORIC ACID AND SILICON ALLOYS
Marvin J. Udy, Anniston, Ala., assignor to Swann Research, Incorporated, a corporation of Alabama
No Drawing. Application April 28, 1932, Serial No. 608,131
1 Claim. (Cl. 23—165)

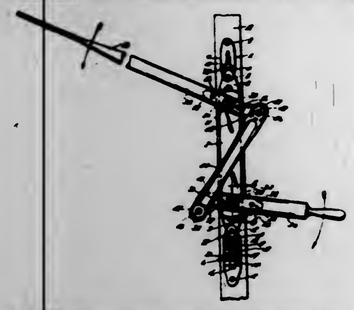


The process which consists in smelting a calcium containing phosphatic ore, a manganese ore and silica together with sufficient carbonaceous material to reduce both said phosphatic ore and said manganese ore and a part of said silica to silicon, whereby a manganese-silicon alloy is formed from said reduced portion of said silica, and combining said unreduced silica with the calcium contained in the phosphatic ore to produce therewith a fusible slag, and simultaneously recovering phosphorus therefrom.

2,000,628
ELECTRIC STEAMING APPARATUS
Lewis E. White, San Francisco, Calif., assignor to Harry L. Worthington, San Francisco, Calif.
Application July 16, 1932, Serial No. 622,875
4 Claims. (Cl. 219—40)

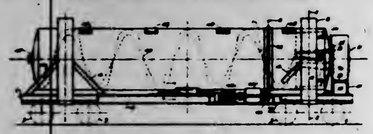
1. A steaming apparatus including a casing; a dielectric water pan in said casing; a pair of electrodes consisting of a plurality of grids horizontally spaced from each other and in juxtaposition to said water pan; an annular bead on said water pan beneath said electrodes; and means for introducing water into said pan around said bead.

2,000,629
FLUID ACTUATOR
Alois Wicha, Dresden, Germany, assignor to Erospha, Inc., Brooklyn, N. Y., a corporation of New York
Application November 7, 1933, Serial No. 696,944
19 Claims. (Cl. 103—133)



1. In a fluid pumping device, a casing having interior relatively rotating side walls and a spherical side peripheral wall connecting said side walls, an impeller piston disc, the periphery of which is in close adjuxtaposition to and substantially spaced from the spherical side peripheral wall and oscillates vertically and horizontally with an oscillating movement between said side walls and about the center point of said casing, a shaft passing into said casing to rotate said side walls having an eccentric cam member actuating said impeller disc and a pivotally connected guide fitting in a slot in said disc preventing rotation of said disc, the axes of said shaft and said pivotally connected guide intersecting at said center point, the periphery of said impeller being located in close adjuxtaposition to said spherical peripheral wall but being spaced therefrom sufficiently to avoid frictional and supporting contact, said adjuxtaposition surfaces being maintained in parallelism but substantially separated from each other throughout operation, the inlet and outlet ports intersecting said spherical peripheral wall and being controlled by the lateral oscillation of the edge of the impeller between the side walls of the casing, the sides of said impeller being smooth and continuous and devoid of projections and embossments and said side walls of said casing being provided with recesses to receive the sides of said disc, the sides of said disc having spaced surface conformations with said recesses in said side walls on opposite sides of the center point of the casing.

2,000,630
BOW FACING OAR
Sion H. Williams, Hornbeak, Tenn.
Application August 30, 1933, Serial No. 687,435
1 Claim. (Cl. 9—25)



In a device of the kind described an elongated carrier bar having at its ends offset and aligned bearing cones, a fixed bearing having a conical socket to receive one of the bearing cones, an adjustable bearing having a conical socket to receive the other bearing cone, the said carrier bar having conical sockets adjacent each end thereof, a handle arm having a bearing cone rotatably seated in one of the sockets of the carrier bar and having a conical socket at its inner end, a handle secured to the inner end of the handle arm, an oar arm having a bearing cone rotatably seated in the other socket of the carrier bar, and having a conical socket at its outer end,

an oar secured to the outer end of the oar arm, a connecting bar having at its ends, bearing cones rotatably seated in the sockets at the inner end of the handle arm and the outer end of the oar

arm respectively, and take-up means for rotatably anchoring the several bearing cones within their respective sockets, whereby wear of the joints of the assembly may be taken up and rattle of parts eliminated.

2,000,631
CAR
Charles E. Windecker, Paineeville, Ohio
Application May 12, 1932, Serial No. 610,885
11 Claims. (Cl. 214—83)

1. A car for transporting dry granular and pulverized materials comprising in combination, an elongated, weather-tight compartment mounted with its major dimension horizontal and longitudinal, a discharge hopper at the end of said compartment, and conveyor means inside said compartment for moving all the materials in said car to said hopper.

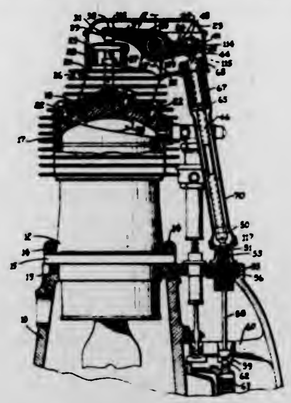
2,000,632
SUPPORT FOR DROOPING PLANTS
Charles Ziegra, Webster Groves, Mo., assignor to John S. Ziegelmeyer, St. Louis, Mo.
Application June 22, 1934, Serial No. 731,843
4 Claims. (Cl. 47—47)

1. A plant support comprising a split ring having each end provided with a loop which slidably engages the ring near the opposite end thereof, means on said ring for engaging said looped ends and holding them against accidental displacement whereby said ring can be adjusted to different diameters, and a plurality of legs having their upper ends pivotally mounted on said ring and adapted to have their lower ends driven into the ground for supporting said ring.

2,000,633
GARMENT
Samuel J. Dichter, Chicago, Ill., assignor to Martha Maid Manufacturing Co., Chicago, Ill., a corporation of Illinois
Application July 30, 1934, Serial No. 737,618
2 Claims. (Cl. 2—73)

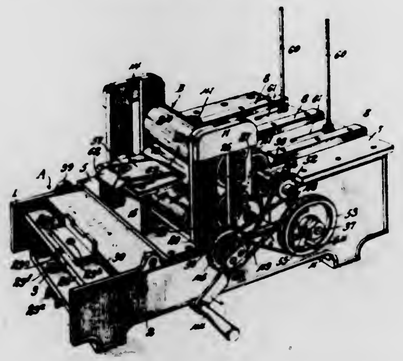
1. In a slip, a skirt, and a bodice portion; said bodice portion including a front panel and a rear panel having a curved front edge extending upwardly and forwardly from the waist line of the garment over the bust of the same; said edge being sewed to the said front panel and having its maximum curvature approximately midway between the waistline and the armpit opening of the garment; the said curved edge tending to straighten out, when the garment is in use, into a substantially vertical or straight side seam so as to place the said panel under stress and thereby cause the same to fit tightly to the body of the wearer throughout that area of the garment through which said curved front edge extends.

2,000,634
METHOD OF MITERING SHEET MATERIAL
Clarence J. Du Brul, Cincinnati, Ohio
Application June 13, 1934, Serial No. 730,499
5 Claims. (Cl. 93—58)



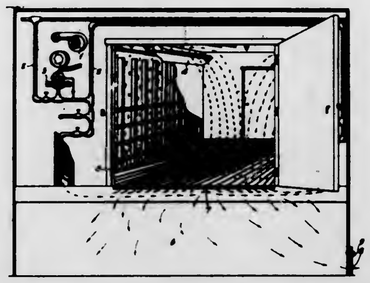
1. The process of making a mitered corner in sheet material of the nature of cardboard, which comprises cutting a slot nearly through the sheet, bending the material at the slot in the direction to open the slot, removing the projecting shoulders along the slot, and bending the sheet in the reverse direction to bring together the surfaces formed by the removal of said shoulders.

2,000,635
INTERNAL COMBUSTION ENGINE
Herbert C. Edwards, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan
Application December 14, 1931, Serial No. 580,971
8 Claims. (Cl. 184—6)



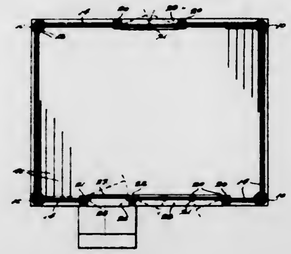
1. In an internal combustion engine, the combination with a valve, of a push rod, a rocker

engaging and operatively connecting said valve and push rod, bearing means including anti-friction rollers for pivotally supporting said rocker, and a mounting for said bearing means, said rocker being formed with lubricant channels hav-



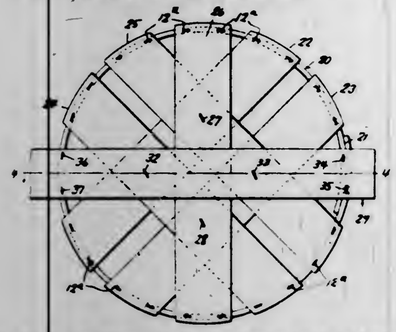
ing uninterrupted communication with said valve and push rod, said mounting having a supply passage for lubricant therein communicating with said channels and having relatively restricted communication with said bearing means.

2,000,636
SHEET FOLDING MECHANISM
Robert C. Flynt, Winston-Salem, N. C., assignor of two-fifths to Forrest G. Miles, Winston-Salem, N. C.
Application July 20, 1934, Serial No. 736,239
12 Claims. (Cl. 270—68)



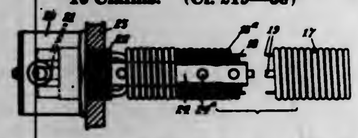
1. In sheet folding mechanism, the combination of an element for forming folds and feeding a folded sheet; a roller for effecting commencement of a fold in a sheet and delivering said sheet to said fold-forming and feeding element; a common driving means for said fold-forming and feeding element and said roller; and driving connections between said driving means and said roller including an over running drive device, said driving connections being such as at all times to provide uninterrupted driving connection except for said over running drive device.

2,000,637
FRUIT COLORING ROOM
Hugh B. Hatch, Dunedin, Fla., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware
Application April 26, 1932, Serial No. 607,648
5 Claims. (Cl. 99—2)



1. An apparatus for coloring fruit or the like comprising a room substantially closed on the sides and top, a slatted floor for said room, a subspace under said room for the escape of air and gases from the coloring room, said sub-space having a cubical capacity of substantially 15 per cent of the capacity of said coloring room, with blower means for projecting circulating treating medium into said coloring room near the top thereof to produce a downward movement of air therein to said sub-space.

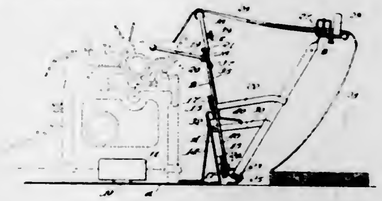
2,000,638
CABIN CONSTRUCTION
Raymond A. Hollingsworth and Bjarne H. Moe, Seattle, Wash.
Application December 14, 1931, Serial No. 580,906
3 Claims. (Cl. 20—2)



1. Side wall construction for a portable cabin comprising, in combination with a foundation including horizontal beams, stud posts seating over said beams, said beams and stud posts being connected by vertical dowel pins in affording swivel action of the stud posts for aligning the several stud posts, one as respects another, said posts being solid and having dove-tail grooves cut into the same to extend vertically throughout the length of the posts, and siding extending between the successive posts, said siding having a tongue-and-groove connection between the lateral edges thereof and being provided at the respective ends with vertical dove-tail tongues, the siding being introduced in the formation of the cabin walls by slidably inserting the dove-tail tongues into the post grooves from the upper ends of the posts.

2,000,639
LID FOR BASKETS
Stinson Huston and Robert E. Huston, Trinity, Tex.
Application May 22, 1934, Serial No. 727,002
9 Claims. (Cl. 217—124)

1. In a flexible cover for fruit and vegetable baskets of the character described, a rim, cross slats fastened across and to the upper edge of the rim, and a main slat secured to and upon the said upper edge of the rim and having end portions extending radially outwardly of the rim at diametrically opposite sides thereof, and said main slat being composed of at least two plies, one of said plies overlying said cross pieces and the remaining one of said plies underlying said cross pieces, and means securing the respective cross slats and plies together.

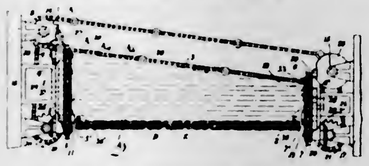


2,000,640
ELECTRIC HEATER
Robert Alfred Frederick Jackson, Glasgow, and Andrew Victor Wilson, Motherwell, Scotland, assignors to The J. P. Tubular Heater Company Limited, Mossend, Lanarkshire, Scotland
Application April 6, 1934, Serial No. 719,392
In Great Britain April 19, 1933
10 Claims. (Cl. 219—38)

1. An electric heater for fluids, a terminal base, the tubular formation of a sheathed heating element mounted upon the base, said tubular formation being deformable, means extending within said tubular formation for stiffening said tubular formation at or adjacent the base while allowing the remainder of the tubular formation to be deformed, said means also allowing circulation of the fluid therethrough into the tubular formation.

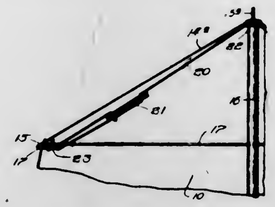
2,000,641
TYPEWRITER ATTACHMENT
Louis Jensen, Chicago, Ill., assignor to United Autographic Register Co., Chicago, Ill., a corporation of Illinois
Application July 30, 1934, Serial No. 737,659
6 Claims. (Cl. 197—126)

1. In combination in a duplicating machine equipped with a platen over which stationery strips interleaved with carbon-strips may be drawn; a forwardly movable carbon-holder disposed in rear of said platen; means for latching said holder in retracted position; and release-means operable by downward pressure of the



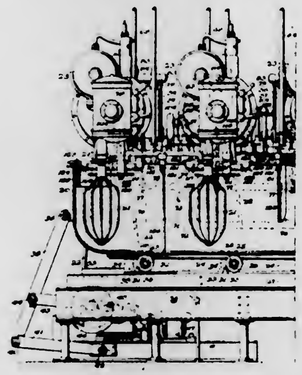
strips, for actuating the latching means to permit forward movement of the carbon-holder.

2,000,642
PHOTOELECTRIC DEVICE
Anthony H. Lamb, Elizabeth, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J., a corporation of New Jersey
Application July 14, 1932, Serial No. 622,531
5 Claims. (Cl. 136—89)



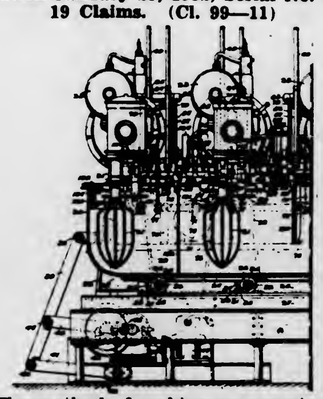
1. A photoelectric device of the voltage-change type comprising a base of insulating material having recesses in one face thereof, a current-generating photoelectric cell snugly received within each of said recesses, each of said cells being of disk form and comprising a layer of actinoelectric material between a back electrode and an upper light-transmitting electrode, conducting strips connecting said cells in cascade, each strip having an end extending to the bottom of one recess and an opposite end overlying the upper electrode of a cell in an adjacent recess, a glass plate overlying said cells and connecting strips, and means clamping said plate to said base to retain said strips in electrical contact with the several cells.

2,000,643
APPARATUS FOR SUPPLYING FIBROUS MATERIAL FOR INCORPORATION IN FABRICS
James Morton, Carlisle, Cumberland, England
Application March 27, 1934, Serial No. 717,675
In Great Britain April 1, 1933
22 Claims. (Cl. 66—85)



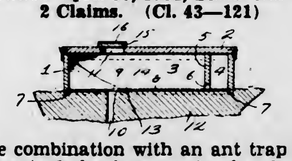
1. Apparatus for supplying fibrous material in stretches comprising co-acting flexible members movable in divergent paths, means for leading the fibrous material to said members, means on said members for engaging said material, and means for moving said members along their respective paths so that their material-engaging means engage the material, draw it out in stretches and feed the stretches to and discharge them at a delivery zone.

2,000,644
TENT
Frank M. Powers, Chicago, Ill., assignor of one-third to Thomas C. Powers and one-third to David W. Powers, both of Chicago, Ill.
Application August 1, 1934, Serial No. 738,004
9 Claims. (Cl. 135—1)



1. A tent, including; a plurality of side walls; a top having a plurality of faces with their lower edges joined to the upper edges of the side walls; a pole for the top; a frame inside of the tent, including a bar adjacent the junction of each side wall and top face with means for connecting the ends of said bars together; and means for supporting said frame, said means including tension members extending from the top of the pole to said frame.

2,000,645
APPARATUS FOR PREPARING FOOD PRODUCTS
Thomas M. Rector, Rutherford, N. J., assignor, by mesne assignments, to The Best Foods, Inc., New York, N. Y., a corporation of Delaware
Application October 30, 1930, Serial No. 492,295
22 Claims. (Cl. 259—93)

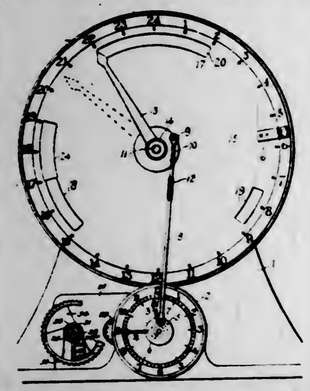


1. Emulsifying apparatus for the continuous manufacture of mayonnaise comprising in combination a container, a beating unit comprising a plurality of beating elements operating in said container, means for feeding starting materials into said container, means for discharging said materials continuously therefrom, means for reciprocating said container relative to said beating unit, said relative movement being effective to feed said materials from said supplying means to said discharging means, and means for adding additional materials to said container at spaced points between said feeding and discharging means.

2,000,646
METHOD OF PREPARING FOOD PRODUCTS
Thomas M. Rector, Rutherford, N. J., assignor to The Best Foods, Inc., New York, N. Y., a corporation of Delaware
Application January 25, 1932, Serial No. 588,753
19 Claims. (Cl. 99—11)

19. The method of making mayonnaise which consists in preparing a flowable mixture containing only egg yolk, spices and water, continuously feeding said mixture and a vegetable oil at predetermined rates to an emulsifying apparatus to form a thick stable emulsion, and continuously diluting the pre-formed emulsion with vinegar.

2,000,647
ANT TRAP
Clayton O. Rudd and Oscar C. Rudd, Phoenix, Ariz.
Application April 30, 1934, Serial No. 723,258
2 Claims. (Cl. 43—121)

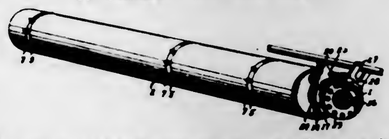


1. The combination with an ant trap comprising a receptacle having a main chamber and an auxiliary chamber with a passage of communication between said chamber and through which dead ants are dragged by live ants from an entrance passage to the main chamber, said entrance passage being in the bottom of the main chamber and adapted to register with the passage of an ant nest, of a poison receiving groove in the bottom of the receptacle and surrounding the entrance thereto and positioned whereby ants passing into the main chamber of the passage thereof and to the auxiliary chamber and vice versa will be compelled to cross said poison receiving groove surrounding the entrance passage to the main chamber.

2,000,648
ELECTRIC SWITCH MECHANISM
Abraham J. Shekter, Jamaica, N. Y.
Application April 27, 1932, Serial No. 607,831
4 Claims. (Cl. 200—36)

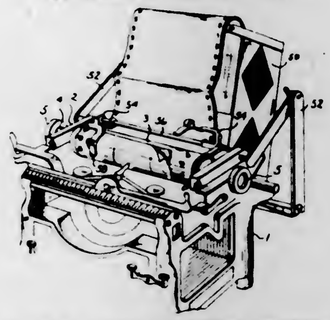
1. In a back and forth operating electric switch mechanism, a clock, in combination with a member revolved by the clock, a connecting rod pivotally attached to the said member at one end and having a reciprocating movement, an insulating plate, a revoluble shaft passing through

the plate, a metal plate arranged beneath said insulating plate, said shaft being insulated from the metal plate, a switch carrying device secured to the shaft and revoluble therewith upon said insulating plate, the remaining end of said connecting rod being pivotally connected with the said device, a conducting switch arm movably



engaging said shaft, a thumb nut for securing and releasing said switch arm upon said switch carrying device, the said insulating plate having an opening in the path of the end of said switch arm whereby contact may be made through the insulating plate with the metal plate, and conductors connected with the metal plate and with the said shaft.

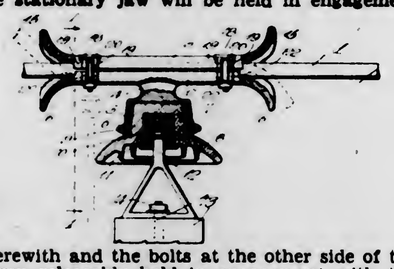
2,000,649
PIN FEED PLATEN ROLL
John Q. Sherman, Dayton, Ohio, assignor to The Standard Register Company
Application June 8, 1931, Serial No. 542,855
25 Claims. (Cl. 197—133)



1. The combination with a platen roll for a writing machine wherein the record material provided with apertures is fed circumferentially about the roll, of a series of reciprocatory pins mounted radially in said roll and means for automatically projecting the pins beyond the periphery of the roll and positively retracting the pins successively as the roll rotates whereby the pins enter the apertures in a direction coincident with the radius of curvature of the record material.

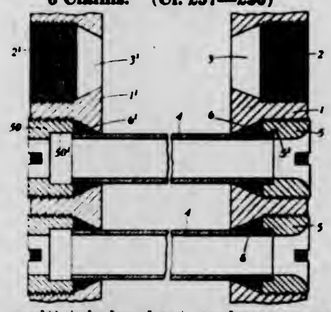
2,000,650
MULTIPIN WHEEL PLATEN
John Q. Sherman and Albert W. Metzner, Dayton, Ohio; said Metzner assignor to said Sherman
Application April 22, 1933, Serial No. 667,424
27 Claims. (Cl. 197—129)

1. Paper feeding means for a writing machine, including a plurality of relatively spaced, concentrically disposed pin wheel units, each including a revoluble body, a series of radially disposed reciprocatory paper engaging pins carried thereby, a cam about which the pins travel during rotation of the body, said cam being rotatively adjustable independently of said body, and detent means for locking the several cams in their adjusted positions.



2,000,651
PIN FEED PLATEN ROLL
John Q. Sherman, Dayton, Ohio
Application December 7, 1933, Serial No. 701,307
In Great Britain July 22, 1933
64 Claims. (Cl. 197—133)

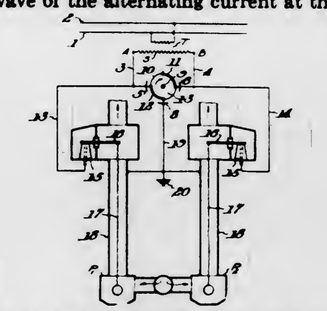
1. A platen roll for a writing machine, a plurality of retractable feeding and aligning pins carried by the roll, means for progressively extending and retracting the pins responsive to the rotation of the roll, and means for shifting the position of greatest projection of the pins circumferentially of the roll.



2,000,652
HOT LINE CLAMP AND INSULATOR
De Forrest E. Snyder, Hazleton, Pa.
Application September 8, 1933, Serial No. 688,654
4 Claims. (Cl. 173—313)

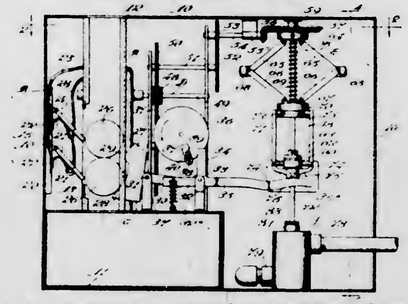
1. In a hot line clamp, an elongated stationary jaw, an elongated movable jaw disposed above and in substantially parallel relation to said stationary jaw, sets of ears projecting from opposite sides of said jaws, the ears of the movable jaw being connected in pairs by bridges and formed with seats back of the bridges, T-bolts extending between the pairs of ears back of said bridges with their cross heads resting in said seats, said bolts extending between ears of the stationary jaw, the ears at one side of the stationary jaw being bridged and the ears at its other side being unbridged and having downwardly extending lips at their outer ends whereby bolts extending between the bridged ears of the stationary jaw will be held in engagement

therewith and the bolts at the other side of the clamp releasably held in engagement with the ears having lips.



2,000,653
HEAT EXCHANGE APPARATUS
Francis Clarence Walter Wilkinson, Burnham, England, assignor of one-half to Crane Packing Limited, Slough, England, a British company, and one-half to Crane Packing Company, Chicago, Ill., a corporation of Illinois
Application December 21, 1933, Serial No. 703,479
In Great Britain December 21, 1932
6 Claims. (Cl. 257—236)

1. A multi-tubular heat exchange apparatus comprising a front tube sheet, a rear tube sheet, and tubes extending between and fitting at their ends into apertures in said sheets, each of said apertures having a cylindrical portion and a frusto-conical portion, a ferrule engageable in each cylindrical portion of an aperture, and a band slidably fitting over the tube and externally coned to fit against said frusto-conical portion of the aperture, the band on the front end of the tube being longer than the band on the rear end of the tube, whereby said tube may slide through said rear band, upon expansion or contraction of said tube, due to temperature changes.



2,000,654
ELECTRICAL TREATMENT OF FLUIDS
Harry A. Wintermute, Plainfield, N. J., assignor to Research Corporation, New York, N. Y., a corporation of New York
Application December 17, 1932, Serial No. 647,823
23 Claims. (Cl. 183—7)

1. A system for energizing a plurality of electrical precipitator units each consisting of at least one discharge electrode and complementary collecting electrode, comprising a transformer adapted to supply high voltage alternating current, electrical connections from the high potential terminals of said transformer to the electrodes of said units, said connections including energy directing devices adapted to pass each half wave of the alternating current at the same

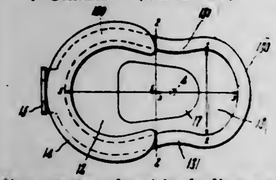
polarity and at substantially the full potential of the transformer successively to the electrodes of alternate groups of electrical precipitator units.

2,000,655
GAS-TIME METER
Fred E. Wood, Glen Ellyn, Ill.
Application August 8, 1932, Serial No. 627,981
14 Claims. (Cl. 194—13)

1. In automatic control apparatus, driving mechanism, coin-controlled means for starting said mechanism, coin-release means, means driven by said driving mechanism for actuating said coin-release means to release a coin after a predetermined period, and control means actuated by said driving mechanism and adapted to release a coin on the stopping of said driving mechanism.

2,000,656
PROCESS FOR FLOATING URANIUM ORES PARTICULARLY CARNOTITE
Harry Howard Armstrong and Arthur Burley Menefee, Los Angeles, Calif.
No Drawing. Application January 30, 1933, Serial No. 654,238
17 Claims. (Cl. 209—166)

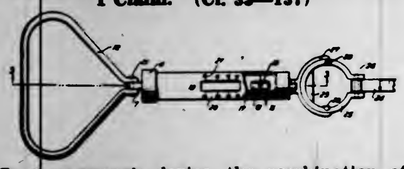
1. The process of floating uranium ores which comprises pulping a uranium ore, adjusting the pH of the pulp to nearly 7 to 8, contacting the pulp with a dilute alkali soap solution and then subjecting said pulp to flotation procedure in the presence of a water-soluble lead salt.



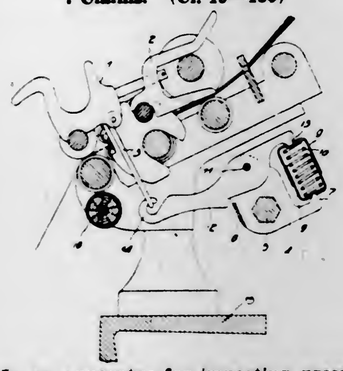
2,000,657
CARD INDEX
John Austin Best, Augusta, Ga.
Application June 27, 1933, Serial No. 677,901
8 Claims. (Cl. 129—16)

4. An index including spaced apart supports, and cards having slots in the lower edge thereof

receiving said supports in all indexed positions including spaced apart groups of similarly related slots, each group including certain slots deeper than others.



2,000,658
WATER CLOSET
Fred G. Bushold, Lawrence, Mass.
Application January 2, 1935, Serial No. 50
7 Claims. (Cl. 4—98)

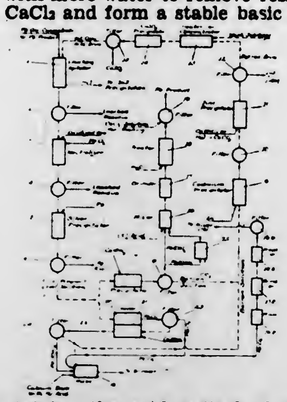


1. A sanitary water closet including a rear evacuating portion, and a basin portion projecting forward therefrom; combined with a bifurcated seat mounted in position to support a person over said rear portion; said basin portion being formed to extend between and project forward from the legs of a user, said bowl having a continuous substantially horizontal oblong receiving mouth defining the upper margin of both portions, the seat being substantially co-extensive with the margin of said rear portion, the basin portion being formed to receive urine projected forwardly from a point between the ends of the seat, and matter projected downwardly from the mouth of a user, without permitting contact of such projected matter with the occupant's legs and clothing, and escape thereof outside the bowl.

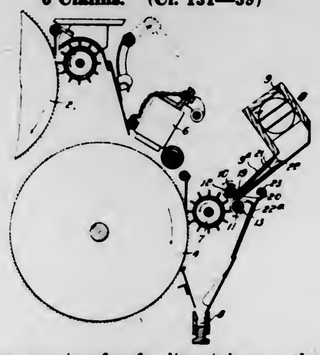
2,000,659
MEASURING INSTRUMENT
Victor E. Carbonara, Brooklyn, N. Y., assignor to Pioneer Instrument Company, Incorporated, Brooklyn, N. Y., a corporation of New York
Application June 13, 1931, Serial No. 544,210
1 Claim. (Cl. 33—137)

In a surveyor's device, the combination of a hook for securing a measuring tape to said device, said hook having a semi-annular portion at the end of which are provided curved fingers projecting upwardly from the plane of the hook and outwardly of the semi-annular portion, and a ring adapted to be engaged by the hook and having a gap in its circumference and having the ends which form the gap projecting from the periphery of the ring in order that a measuring tape may be fastened to said ends, said hook being adapted to engage said ring only when the ring is over the semi-annular portion and so positioned that one or the other of the curved fingers of the hook is in the gap, and after engagement of the ring by the hook the curved fingers engage the ring on opposite sides of the gap.

2,000,660
APPARATUS FOR IMPARTING PRESSURE TO THE CYLINDERS OF THE MECHANISMS FOR DRAWING TEXTILE ROVINGS
Fernando Casablancas, Sabadell, Spain
Application August 23, 1932, Serial No. 630,106
In Spain May 10, 1932
7 Claims. (Cl. 19—136)



1. In an apparatus for imparting pressure to the upper cylinders of the drawing mechanism for textile rovings comprising a table, a stand carried by said table for supporting the cylinders, a fixed bar extending through the whole length of the machine in parallel alignment with the cylinders and supported above the table, a frame composed of a pair of connected plates fixed on the bar, a single lever pivotally mounted in the frame, a coil spring carried by said frame engaging the lever for rotating the lever in one direction, saddles for engaging the upper cylinders, and a rod connecting the saddles to said lever, whereby to transmit the action of said spring to said saddles and tension the same on the upper cylinders.

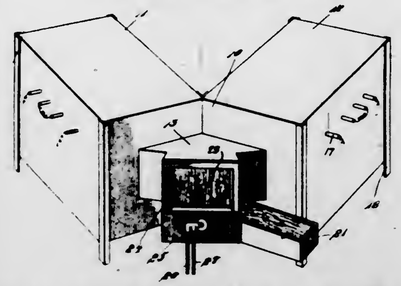


2,000,661
PROCESS OF MAKING PIGMENTS FROM LEAD ORES
Niels C. Christensen, Salt Lake City, Utah
Application October 12, 1931, Serial No. 568,512
5 Claims. (Cl. 23—127)

1. The process of making basic lead pigments from lead ore material in which the lead is recovered from said ores and the like in a chloride brine, which consists in precipitating a portion of the lead from said brine as lead chloride and precipitating another portion of the lead from said brine by adding thereto an amount of calcium hydroxide which is substantially less than chemically equivalent to the lead in said brine, but more than three-quarters of said equivalent, to produce a precipitation of lead hydroxide containing some lead hydroxychloride, and mixing said precipitates in the proper proportion with a calcium salt of an acid of which the normal and basic lead salts are insoluble in amount substantially chemically equivalent to the lead chloride in said mixture, and treating said mixture with water and washing out the $CaCl_2$ formed during said treatment and treating the residual

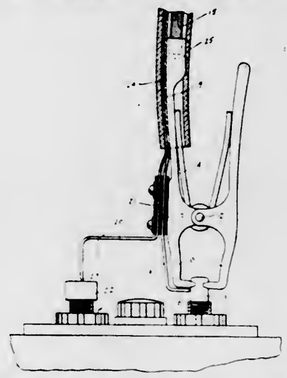
product with more water to remove residual calcium as $CaCl_2$ and form a stable basic lead pigment containing the acid radical of the above said calcium salt.

2,000,662
DUST EXTRACTION APPARATUS
Ernest Coffin and Félix Frédéric Ruau, Deptford, London, England
Application February 5, 1934, Serial No. 709,882
In Great Britain February 11, 1933
6 Claims. (Cl. 131—39)



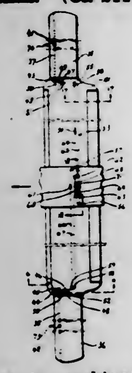
1. In apparatus for feeding tobacco, the combination with a carded conveyor for the tobacco, of a picker roller having projections thereon for removing the tobacco from said conveyor, a pair of movable dust arresting elements located adjacent said picker roller and spaced apart from each other to provide a free passage between said elements, and a suction duct extending lengthwise of said elements connected at one end with a source of suction and at the other end engaging the dust arresting elements and forming a continuation of the passage formed between said elements.

2,000,663
PROCESS OF DRYING MATERIALS
William A. Darrah, Chicago, Ill., assignor to United States Gypsum Company, Chicago, Ill., a corporation of Illinois
Application October 15, 1930, Serial No. 488,852
14 Claims. (Cl. 34—24)



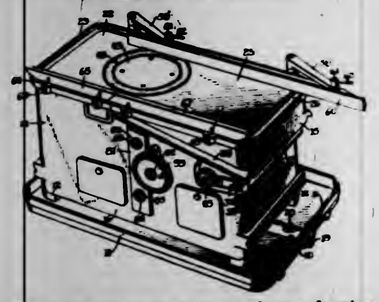
1. The process of drying materials by subjecting said materials to the action of a moving stream of hot products of combustion to which free ammonia has been added, to neutralize some of the various acids contained in the products of combustion.

2,000,664
MULTIPLE FURNACE
Carl I. Hayes, Cranston, R. I., assignor to Harold C. Field, Providence, R. I.
Application October 2, 1929, Serial No. 396,716
Renewed April 25, 1932
15 Claims. (Cl. 263—36)



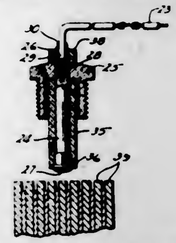
12. In combination, two furnace chambers for heat treatment having entrance throats, a passageway communicating said throats and having an entrance opening, and means for maintaining atmospheres of regulated constituency in said chambers and passageway.

2,000,665
BATTERY CLIP
Leon P. Neal, Detroit, Mich., assignor to Joseph Weidenhoff
Application February 10, 1930, Serial No. 427,399
21 Claims. (Cl. 173—324)



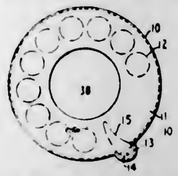
19. A binding post contactor for spaced battery posts comprising a plurality of resiliently connected, electrically insulated contact members, each of said contact members being urged by the resiliency into wiping engagement with an adjacent battery post, a flexible cable secured to said contactor, said cable providing connection means to testing devices at least at three points, said contact members placing two of said connection means in conductive relation to one of the spaced battery posts and the third connection means into conductive relation to the remaining battery post.

2,000,666
AIRCRAFT
Robert R. Osborn, Garden City, and Theodore P. Wright, Port Washington, N. Y., assignors to Curtiss Aeroplane & Motor Company, Inc., a corporation of New York
Application March 19, 1930, Serial No. 436,937
10 Claims. (Cl. 244—29)



1. In an airplane, in combination, a rigid wing, means carried by and forming with said rigid wing a unit lifting surface capable of operation at higher effective angles of attack, without a falling off in lift, than is possible with said rigid wing alone, ailerons for controlling said airplane carried by and having transversely extending pivot axes disposed without the confines of said unit lifting surface, said ailerons, when neutral, being so positioned with respect to said unit lifting surface that each, regardless of the effective angle of attack of said unit lifting surface, occupies a position in substantial parallelism with the attacking air stream and is subject to substantially equal air pressures on its upper and lower surfaces, and means for operating said ailerons from the pilot's space within the airplane.

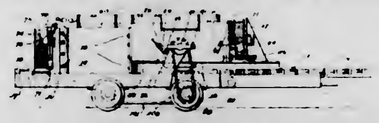
2,000,667
GRINDING MACHINE
William C. Osterheim, Oak Park, Ill.
Application December 11, 1931, Serial No. 580,269
12 Claims. (Cl. 51—110)



1. In a grinding machine, a frame having end and side walls, and a substantially horizontal surface for supporting objects thereon, a grinding wheel, means mounting said wheel with its axis of rotation substantially vertical, said means including a housing, vertical guides provided on said housing, and means secured to said side walls for receiving said guides, whereby said housing is mounted for vertical movement.

2,000,668
ELECTRODE
Frederick J. Pease, Wauwatosa, Wis., assignor to Clum Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Original application December 22, 1930, Serial No. 503,963. Divided and this application January 7, 1932, Serial No. 585,190
4 Claims. (Cl. 136—182)

1. The combination with a closure plug for an electrolytic cell, said plug having an aperture through its top, of an electrode extending through said aperture and having one end threaded to receive a nut and the other end provided with a terminal head spaced from said plug, a dielectric sleeve on said electrode confined between said plug and head and extending from said plug top to a plane in which the margin of the end face of said head terminates in contact with said sleeve, and a nut on the threaded end of said electrode supported from said plug and holding said head in clamping engagement with said sleeve.

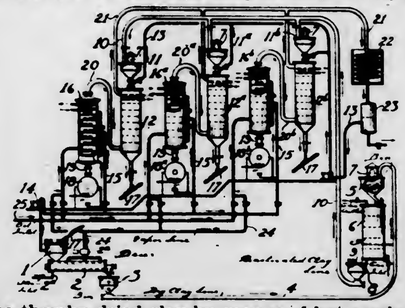


2,000,669
LOCKING DEVICE FOR DIAL TELEPHONES
Rouvime B. Poliakoff, New York, N. Y.
Application April 23, 1931, Serial No. 532,243
1 Claim. (Cl. 179—189)

In combination with a call dial mechanism having a rotatable apertured dial and a finger stop adjacent said dial secured to said mechanism by a screw partly outside the radius of said dial, a locking device comprising a cup-shaped body surrounding said dial and having a deformation enclosing said stop and screw, and key-operable means enclosed in said body for locking same to said mechanism whereby removal of said screw and movement of said dial is prevented.

2,000,670
MINING MACHINE
Charles A. Pratt, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application March 10, 1932, Serial No. 597,916
Renewed September 15, 1934
7 Claims. (Cl. 262—30)

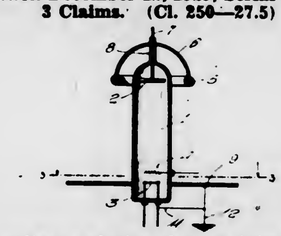
1. In a mining machine, a motor slidable directly on the mine bottom and having a vertical armature shaft, a frame disposed forwardly of said motor having a projecting cutter bar extending forwardly therefrom, said cutter bar being disposed in planes which intersect said motor and having a cutter chain guided for movement thereabout, feeding mechanism therefor comprising a feed drum disposed adjacent the forward end of said main frame for rotation about a longitudinally extending axis and having a flexible feeding member adapted to be wound thereon, and means for selectively driving said feeding and cutting mechanism from said motor comprising a vertical shaft driven from said armature shaft and having a cutter chain drive sprocket freely mounted on its lower end, clutch means for selectively connecting said sprocket with said shaft, a shaft extending longitudinally



of said main frame and journaled therein at its forward and rearward ends, means for selectively driving said longitudinal shaft from said vertical shaft at either a low speed or a higher frictionally controlled speed comprising a frictionally controlled geared speed reduction device coaxial with said longitudinal shaft and a geared connection between said feed drum and longitudinal shaft comprising a shaft coaxial with the axis of rotation of said drum and having its axis of rotation disposed adjacent the longitudinal center line of said cutter bar, an operative connection between said shaft and feed drum and a geared connection between the inner end of said shaft and said longitudinal shaft.

2,000,671
ARTIFICIAL SILK FILAMENT
James A. Singmaster, Bronxville, N. Y.
No Drawing. Application June 29, 1929, Serial No. 374,968
4 Claims. (Cl. 28—1)

1. An artificial silk filament of diminished luster having submerged in and distributed throughout its mass material fine particles of preformed zirconium oxide substantially white in color and having a light refractive index substantially different from that of the mass material, the size of said particles not materially exceeding 0.75 microns and said particles being present in such small quantity and so thoroughly dispersed in the mass material as not to materially impair the continuity of such mass material.

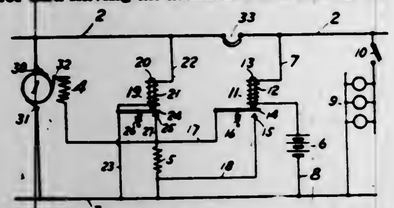


2,000,672
PROCESS FOR CONTINUOUSLY USING CLAY IN TREATING TOWER SYSTEMS
Reginald K. Stratford, Sarnia, Ontario, and Charles Leaver, Toronto, Ontario, Canada, assignors to Standard Oil Development Company, a corporation of Delaware
Application January 16, 1931, Serial No. 509,142
3 Claims. (Cl. 196—96)

1. The continuous process of treating hydrocarbon oil with clay, which comprises: vaporizing the oil, passing the vaporized oil into a treating zone wherein the vaporized oil is caused to pass in countercurrent to a flow of treating material comprising clay and condensate produced from the vapors, removing condensed treated oil and clay from said clay-treating zone, mechanically separating the major part of the oil from the clay, and reducing the separated clay to a substantially dry state by distilling it under the application of heat and subatmospheric pressure, revivifying

the thereby dried clay by means of hot combustion gases and returning it to said treating zone.

2,000,673
ELECTRON TUBE
Frederick E. Terman, Stanford University, Calif. assignor to Wired Radio, Inc., New York, N. Y., a corporation of Delaware
Application December 12, 1929, Serial No. 413,555
3 Claims. (Cl. 250—27.5)

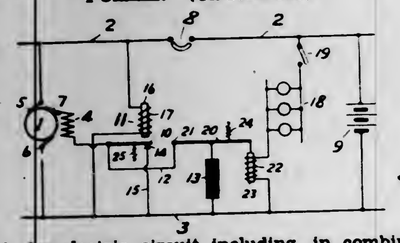


1. A voltage reducing electron tube comprising an evacuated vessel, a cathode and a grid disposed within said vessel, a plate electrode disposed within said vessel and separated from said cathode and grid, and a conductive member of toroidal shape electrically connected to said plate electrode and surrounding said vessel and mounted adjacent said plate electrode.

2,000,674
MEANS FOR REGULATING THE OUTPUT OF A GENERATOR
Charles W. Terry, Detroit, Mich.; assignor to The Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey
Application July 27, 1934, Serial No. 737,287
3 Claims. (Cl. 171—313)

3. An electric circuit, comprising in combination, a generator of the third brush type having the characteristic that its maximum output is substantially constant, a resistor, a storage battery, translating devices, connections between said storage battery and said translating devices and said generator, a switch controlling the connection between said storage battery and said translating devices and said generator, a second switch controlling the connection between said translating devices and said storage battery, a vibrating relay having a coil responsive to the current flowing through said battery and independent of the current flowing through said translating devices and having an armature controlling connections including said third brush and said resistor so that the maximum output of said generator is reduced when said connections are open, and a second relay having a volt-

age coil responsive to the voltage of said generator and having an armature controlling a con-



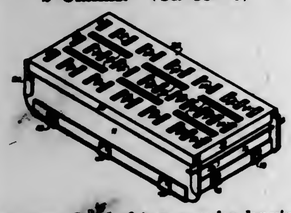
nection paralleling said resistor and in series with said third brush.

2,000,675

MEANS FOR REGULATING THE OUTPUT OF A GENERATOR

Charles W. Terry, Detroit, Mich., assignor to The Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey

Application July 31, 1934, Serial No. 737,709
4 Claims. (Cl. 171—313)



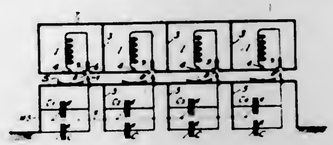
4. An electric circuit including, in combination, a generator having the characteristics of limiting its maximum output to a predetermined value, translating devices, a storage battery, connections between said generator and said translating devices and said storage battery, a carbon pile, connections between said generator and said carbon pile such that the maximum output of said generator is reduced by an amount varying with the resistance of said carbon pile, a solenoid responsive to current passing through said translating devices and independent of current passing through said storage battery, a lever operated by said solenoid to decrease the resistance of said carbon pile in response to increase in current through said translating devices, a circuit short circuiting the connection of said carbon pile to said generator and a relay having a coil responsive to the voltage of said storage battery and an armature connected to open said last-mentioned circuit when the voltage of said storage battery rises to a predetermined value.

2,000,676

MEANS FOR MAKING CONFECTIONS

Giles M. Teague, Charlotte, N. C.

Application July 7, 1932, Serial No. 621,222
2 Claims. (Cl. 53—6)



1. Apparatus for baking a cake having a plurality of cavities therein, comprising a base, sides and ends pivotally secured to said base, a top having downturned flanges at its ends and sides for holding the sides and ends in vertical position, said top having a plurality of openings therein to admit heat to the top of the dough being baked, said top having a plurality of other openings therein, a hollow shell surrounding each of said other openings and extending downwardly towards the said base whereby heat is admitted directly to the interior of the shells.

2,000,677

TUNING SYSTEM

Bertram Trevor, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application February 12, 1932, Serial No. 592,533
7 Claims. (Cl. 250—20)

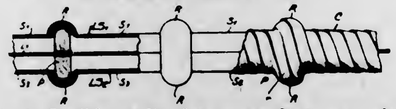
1. Means for tuning a radio receiver over a wide frequency range comprising, a separate group of capacitive and inductive circuits, a plurality of individually shielded compartments having capacitive tuning means, a plug-in coil compartment including a plurality of individually shielded inductances, and means comprising separate contact members on each compartment for completing the circuits between each of the individually shielded compartment inductances and capacities when the plug-in unit is placed in position.

2,000,678

DIFFERENTIAL CONDENSER

Balthasar van der Pol and Romyn Veldhuyzen, Eindhoven, Netherlands, assignors to Radio Corporation of America, a corporation of Delaware

Application June 4, 1932, Serial No. 615,292
In Germany June 12, 1931
5 Claims. (Cl. 250—20)



1. In a radio receiving system including an antenna circuit associated with the input of radio apparatus through a coupling condenser, said condenser comprising three cooperating plates, two thereof being fixed and the third being adjustably associated with respect to the other two thereof, said cooperating plates acting to control the degree of coupling between the antenna circuit and the radio apparatus input, said movable plate comprising an insulating part arranged with respect to the fixed plates so that the surface thereof increases when the variable plate is adjusted in one direction and vice versa, said insulating part being shaped and possessing such dielectric characteristics that the total value of the capacity between one of the fixed plates and the movable plate and the mutual capacity between the fixed plates remains constant.

2,000,679

FLEXIBLE HIGH FREQUENCY LINE

Ludwig Walter, Berlin, Germany, assignor to Telefunken Gesellschaft fur Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application February 6, 1932, Serial No. 591,280
In Germany February 7, 1931
5 Claims. (Cl. 173—265)

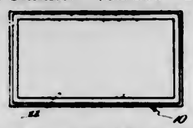
1. A flexible radio frequency line comprising inner and outer conductors spaced apart by insulating rings whose outer periphery is rounded over to form an element of a ball joint, said outer conductor consisting of a plurality of horizontally split tubular links of relatively short length, each of the ends of said links having their ends formed in spherical manner to engage and forming the other element of said ball joint, said links being joined by an outer holding ring.

2,000,680

HOSE COUPLING

Albert J. Weatherhead, Jr., Cleveland, Ohio, assignor to The Weatherhead Company, Cleveland, Ohio, a corporation of Ohio

Application December 18, 1931, Serial No. 581,893
6 Claims. (Cl. 29—88.2)



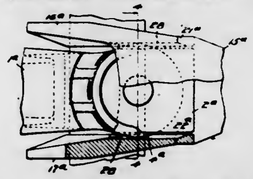
1. A method of securing a flexible hose of nonmetallic material in a metallic coupling having an internal nipple and an integral external sleeve for engaging the inner and outer surfaces of the hose respectively, which consists in inserting the hose into the sleeve so that the nipple embraces the inner surface of the hose and thereafter applying radial pressure to the sleeve in the zone behind the end of the sleeve to deform the metal of the sleeve inwardly, to grip the hose against the nipple, while simultaneously elongating said sleeve and flaring a portion thereof.

2,000,681

DISPLAY CASE

George H. Weller, Providence, R. I., assignor to The Mason Box Company, Attleboro Falls, Mass., a corporation of Massachusetts

Application April 3, 1934, Serial No. 718,759
12 Claims. (Cl. 206—44)



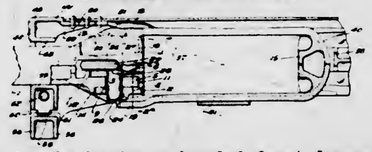
1. A display case comprising a box having upstanding walls, a cover having depending walls which telescope over the upper ends of the box walls when the cover is applied to the top of the box and which telescope over the lower ends of the box walls when the cover is applied to the bottom of the box in inverted position, and a rim on the outside of the box walls intermediate their upper and lower ends to limit said telescopic action when the cover is applied either to the top or to the bottom of the box, said rim comprising sheet material extending horizontally from the box walls outwardly beyond the outer perimeter of the cover walls, and means for anchoring said rim on the outside of the box walls.

2,000,682

DRAFT RIGGING

Norman B. Akitt, Rochester, N. Y., assignor to The Symington Company, New York, N. Y., a corporation of Maryland

Application December 31, 1928, Serial No. 329,503
6 Claims. (Cl. 213—69)



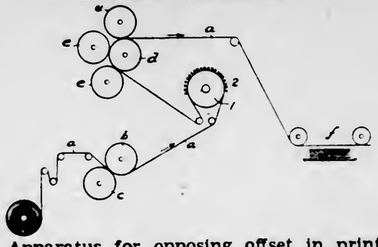
1. A yoke with a hooded front end, the side walls of which are channeled to individually receive edge portions of coupler shank loops extended to a width greater than that of the adjacent forward portion of the shank proper.

2,000,683

DRAFT RIGGING

Norman B. Akitt, Rochester, N. Y., assignor to The Symington Company, New York, N. Y., a corporation of Maryland

Application July 13, 1929, Serial No. 378,147
4 Claims. (Cl. 213—50)

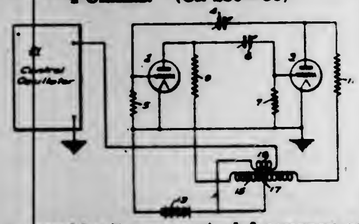


3. A yoke having a hooded front formed by two pairs of oppositely disposed walls, one pair forming top and bottom walls of said hooded front and being bulged locally along the longitudinal center line forming grooves open at the forward ends of said walls, and coupler guiding shoulders at opposite sides of said grooves.

2,000,684

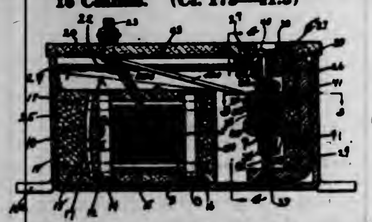
OPPOSING OFFSET IN PRINTING AND THE LIKE

William Watson Allen, Aldan, and Allen L. Grammer, Meadowbrook, Pa., assignors to The Curtis Publishing Company, Philadelphia, Pa., a corporation of Pennsylvania



Application November 21, 1932, Serial No. 643,548
4 Claims. (Cl. 34—48)

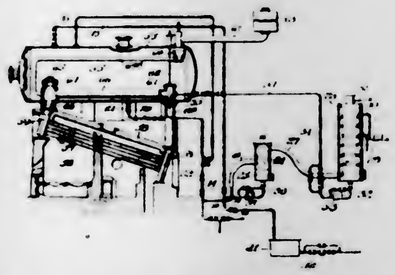
1. Apparatus for opposing offset in printing comprising in combination, a revoluble cylindrical electrode, a cylindrical row of vacuum tubes



constituting another electrode and spaced from the surface of the cylindrical electrode and of which the glass provides a dielectric, electrical means for flowing electrons from the dielectric and between the electrodes, and means for leading a newly printed sheet or web between one of the electrodes and the dielectric.

2,000,685
CONTROL SYSTEM
Victor J. Andrew, Wooster, Ohio, assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application June 27, 1931, Serial No. 547,205
4 Claims. (Cl. 250—36)

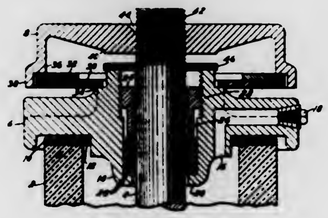
1. In combination a control frequency source, means for producing an oscillatory condition comprising an oscillator of the multi-vibrator type including a pair of discharge devices, the frequency of said oscillatory condition bearing a definite sub-harmonic relationship to that of the control frequency, and means for impressing upon each of said discharge devices an alternating potential derived from said control source, said potentials being 180 degrees out of phase with each other.



2,000,686
VARIABLE MICA CONDENSER
William M. Bailey, Lynn, Mass., assignor, by mesne assignments, to General Electric Company, a corporation of New York
Application January 16, 1929, Serial No. 332,920
16 Claims. (Cl. 175—41.5)

1. A capacitor of variable effective area which comprises spaced conducting elements, a solid dielectric between said elements, a spindle extending thru, and in both directions from, one of said conducting elements and having threaded engagement therewith to move it in its plane relative to the other conducting element; a stationary bearing for one of said spindle extensions; means holding said conducting and dielectric elements resiliently in operative relations and yieldingly supporting said spindle laterally; and means holding the spindle from axial movement; all whereby turning of the spindle on its said stationary bearing operates said movable conducting element in its plane in a direction transverse to the pressure of said resilient holding means.

3. A variable capacitor which includes capacitor elements including a dielectric plate arranged in parallel planes, a casing housing said elements and having an insulating portion formed with at least three openings; a threaded metal spindle supported inside the casing for turning and having an operating end accessible from the exterior of the casing by way of one of said casing openings; two circuit terminals mounted over the other two casing-openings; one of the armatures of said capacitor units inside the casing being supported by an operating connection to said spindle by way of the threads thereon, said armature being movable in its own plane parallel to the plane of the cooperating capacitor elements, by turning of the threaded spindle, said spindle being supported longitudinally immobile in the casing; a lead inside the casing and electrically connecting the spindle to one of said circuit terminals; means supported inside the casing and holding stationary the capacitor elements cooperating with said movable armature; and a lead inside the casing and electrically connecting the second circuit terminal to an armature of the stationary capacitor elements.



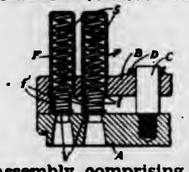
2,000,687
CONTINUOUS PRESSURE DISTILLATION PROCESS
Oswald C. Brewster, Kansas City, Mo., and Max G. Paulus and Andrew E. Thompson, Casper, Wyo., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Original application February 13, 1928, Serial No. 253,976. Divided and this application July 21, 1930, Serial No. 469,500
14 Claims. (Cl. 196—59)

8. In apparatus for distilling hydrocarbon oils under pressure for the production of lighter hydrocarbon oils of the character of gasoline, a container, a heating section, a conduit comprising a portion extending into and through said container and another portion extending through said heating section and connected to the first mentioned portion to form a continuous cyclic passage for the oil, the portion of the conduit extending into said container being provided with a constricted opening through which a portion of the oil may escape into said container and means for supplying fresh oil to said conduit.

12. The method of effecting the distillation of hydrocarbon oils under pressure for the production of low boiling hydrocarbon products such as gasoline, which comprises maintaining a substantial body of oil at conversion temperature and under pressure, flowing oil to be converted continuously through a heating zone, discharging a portion of said heated oil into said body of oil, and flowing the remaining portion of the said oil through a tubular conduit in indirect heat conductive relationship with said body of oil and without admixture therewith thence to said heating zone.

2,000,688
SEAL
Gordon A. Burr, Wilkinsburg, and Edwin E. Arnold, Pittsburgh, Pa., assignors to Westinghouse Electric and Manufacturing Company, a corporation of Pennsylvania
Application March 18, 1932, Serial No. 599,702
4 Claims. (Cl. 173—318)

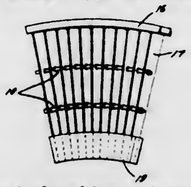
1. The combination of a dielectric tube, a conductor extending axially through and having a portion projecting beyond said tube, an end closure cap for said tube having a centrally disposed stuffing box for maintaining a seal between said cap and the projecting portion of said conductor, a ring-like gasket providing a seal between the cap and the end of said tube, and resilient means on the projecting portion of said conductor for pressing said cap upon the end of said tube.



2,000,689
WOOD STAINING
William Stansfield Calcott, Pennsgrove, and Charles J. Pedersen, Carneys Point, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 23, 1930, Serial No. 504,426
7 Claims. (Cl. 91—68)

1. The process of staining wood which comprises treating the wood with a composition of matter comprising an organic solvent selected from the group consisting of alcohol, the monoethyl ether of ethylene glycol, benzene, acetone and toluene, a member selected from the group consisting of m-toluylene-diamine, m-phenylene-diamine, p-phenylene-diamine, m-naphthylene-diamine, p-amino-phenol, and p-amino-anisole, and cupric chloride, and thereafter exposing the treated material to the action of air.

2,000,690
SOLVENT REFINING OF HYDROCARBON OIL
Louis A. Clarke, Fishkill, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
No Drawing. Application November 3, 1933, Serial No. 696,540
2 Claims. (Cl. 196—13)



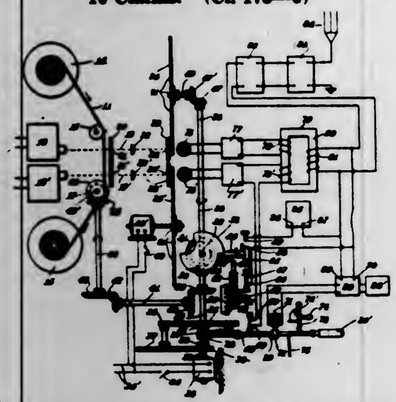
1. The method of refining hydrocarbon oil containing relatively paraffinic and relatively non-paraffinic constituents, including naphthenic, aromatic, and unsaturated bodies, to remove undesired relatively non-paraffinic constituents therefrom, which comprises extractively treating the oil with a solvent selected from the group consisting of benzoyl, toluyl and xyloyl furan whereby the undesired constituents are separated from the oil as an extract soluble in the solvent liquid.

2,000,691
COMPRESSOR DISCHARGE VALVE
Lester L. Collins, Franklin, Pa., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey
Application April 2, 1931, Serial No. 527,218
4 Claims. (Cl. 277—60)

1. A valve assembly comprising a seat member, a plate or disk valve on said member, a keeper secured to said member over said valve and having a series of bores therethrough, springs extending through said bores for yieldingly maintaining said valve in contact with said member, and housing means for said springs mounted in said bores, said valve being movable relatively to said housing means.

2,000,692
METHOD OF UNITING NICKEL CHROME STEEL TURBINE BLADES
Paul C. Dimberg, Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application May 9, 1930, Serial No. 450,974
4 Claims. (Cl. 29—156.8)

1. The method of making a steam turbine blade segment, comprising shaping a plurality of turbine blades from nickel chrome steel, electroplating said blades with silver, arranging said plated blades in position to constitute a segment of turbine blading, disposing a shroud ring segment in contact with the ends of said blades, heating the contacting end of each blade and the adjoining shroud ring portion to a temperature not materially greater than that at which the silver plating on the blade end fuses, and applying silver solder to said heated blade end and said shroud ring portion to join them.

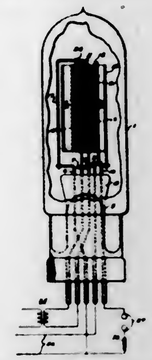


2,000,693
SYSTEM IMPERVIOUS TO UNBALANCED FAULTS
Alexander D. Dovjikov, Wilkinsburg, Charles Le G. Fortescue, Pittsburgh, and Charles F. Wagner, Swissvale, Pa., assignors to Westinghouse Electric and Manufacturing Company, a corporation of Pennsylvania
Application June 5, 1931, Serial No. 542,308
33 Claims. (Cl. 172—237)

1. In a three-phase electric power line, the combination, with said line, of series-balancer means for preventing the flow of negative-phase-se-

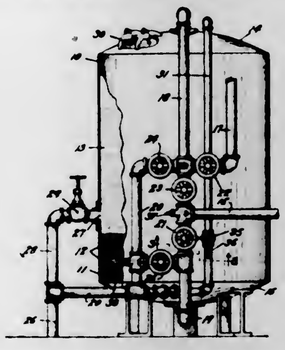
quence current in said line, and instantaneously operative means, responsive only to three-phase faults, for disconnecting a faulty line section.

2,000,694
TELEVISION SYSTEM
Edgar H. Felix, Ridgewood, N. J., assignor to Radio Inventions, Incorporated, New York, N. Y., a corporation of New York
Application March 16, 1932, Serial No. 599,179
10 Claims. (Cl. 178—6)



1. Apparatus for transmitting moving images including means for reducing the apparent motion thereof to a degree substantially below the point of persistence of vision, transmitting said image at a similarly slow rate of speed, reproducing said image at a correspondingly slow rate of speed, and then raising the rate of motion of said image to normal, transmitting only the portions of said image which are moving, and altering said first reproduced image in accordance with the portions thereof which are in motion.

2,000,695
HOT CATHODE ELECTRON DISCHARGE TUBE
Hubert M. Freeman, deceased, late of East Pittsburgh, Pa., by Max F. Reges, administrator, Bloomfield, N. J., and Wallace G. Wade, Philadelphia, Pa., assignors to Westinghouse Electric and Manufacturing Company, a corporation of Pennsylvania
Original application January 8, 1923, Serial No. 611,263. Divided and this application June 24, 1932, Serial No. 619,600
9 Claims. (Cl. 250—27.5)

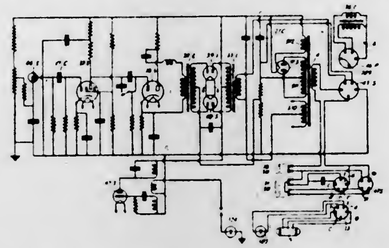


1. A thermionic cathode electron-discharge tube comprising a cathode structure comprising a U-shape heating wire having closely disposed parallel heater sections and a tubular sheath comprising platinum strip wound about said heater sections, the outer surface of said sheath being adapted to emit electrons when heated, and a surface layer of insulating oxide intervening between said heater sections and said sheath.

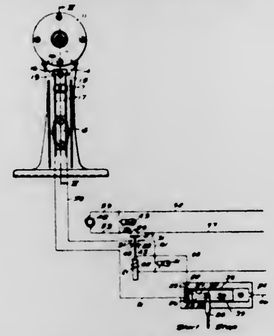
7. An electron discharge device comprising a plurality of cooperating electrodes, at least one of said electrodes being an indirectly heated electron-emitting cathode comprising a metallic sleeve serving as an electron-emitter and a heater surrounded substantially by said sleeve, but maintained out of direct electrical contact therewith, said heater comprising a two-leg electric conductor anchored about its center and connected at its ends to lead-in conductors and comprising an insulating, high heat-resisting coating formed

on at least said legs and at least physically adhesively bound thereto.

2,000,696
ZEOLITE WATER SOFTENER
Robert O. Friend and John A. Montgomery, Chicago, Ill.
Application June 9, 1932, Serial No. 616,186
2 Claims. (Cl. 210—24)



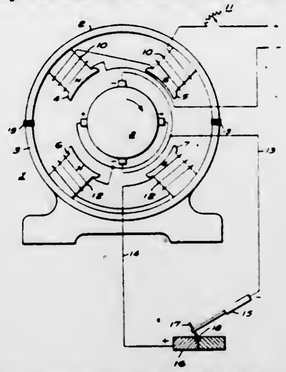
1. A water treating apparatus comprising: a closed tank; a water dispersing medium in the bottom of said tank; a gravel bed on said dispersing medium; a layer of nonbuoyant, base exchange mineral supported on said gravel bed; a water discharge at the top of said tank; a side outlet positioned in said tank above the top of said gravel bed and below the top of said layer of mineral; and means for controlling the flow through said side outlet.



2,000,697
TALKING MOTION PICTURE APPARATUS
Alfred N. Goldsmith, New York, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application May 26, 1932, Serial No. 613,701
13 Claims. (Cl. 179—100.3)

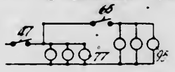
1. Talking motion picture apparatus for use with either a direct or alternating current supply circuit comprising a projection lamp, an amplifier circuit, and unitary means for supplying the amplifier with alternating current derived

from said supply circuit irrespective of the type of current fed to said supply circuit and for supplying said lamp with current directly from said supply circuit.

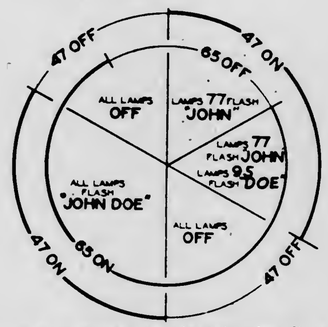


2,000,698
MOTION PICTURE APPARATUS
Clinton R. Hanna, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application March 20, 1930, Serial No. 437,372
2 Claims. (Cl. 242—57)

1. In combination in film-handling apparatus, means for advancing a film strip, means for energizing said advancing means, a normally open circuit and means for temporarily closing said circuit for temporarily bringing said energizing means into cooperative relationship with said advancing means, means to be rotated by said film-strip when it is advanced and means having only frictional engagement with said film-rotated means to be actuated by said film-rotated means when and as long as it is rotated to close said circuit and thereby to maintain said film-advancing mechanisms in energized condition to advance said film-strip.



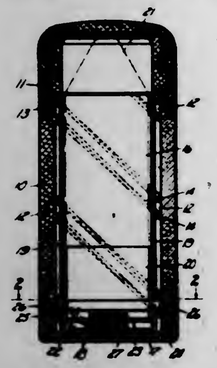
2,000,699
ARC WELDING GENERATOR
William R. Harding, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application September 29, 1931, Serial No. 565,743
9 Claims. (Cl. 171—223)



1. In an electric generator for supplying current to an arc welding circuit, in combination, a main field winding and a differential series field winding, and means for magnetically insulating said windings from each other, said series field winding thereby being disposed to produce substantially no effect on the main field winding

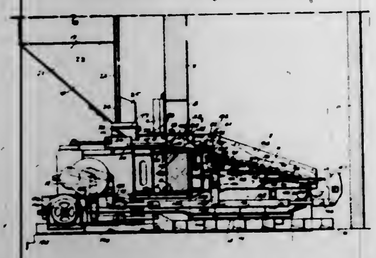
when the current in the series field winding is changed.

2,000,700
SIGN FLASHER
Clifford Hotchkiss, Elkhart, Ind., assignor, by mesne assignments, to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application June 23, 1930, Serial No. 462,951
8 Claims. (Cl. 177—346)



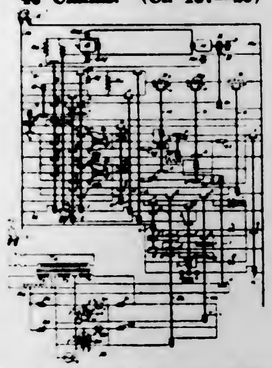
1. In combination, an electric circuit, a source of current therefor, two sets of lamps connected in parallel in said circuit, a master switch incorporated in said circuit between one side of the source of current and both sets of lamps and having entire control of one of said sets of lamps, an auxiliary switch connected in series in said circuit between the master switch and the other set of lamps only whereby one set of lamps is energized solely under the control of the master switch and the other set of lamps is energized under the joint control of the master and auxiliary switches, and means for periodically opening and closing said switches at different periods.

2,000,701
CONTAINER FOR LIP STICKS AND THE LIKE
Andre Janer, Flushing, N. Y., assignor to The A. J. & K. Company, Incorporated, New York, N. Y., a corporation of New York
Application March 18, 1933, Serial No. 661,467
7 Claims. (Cl. 206—56)



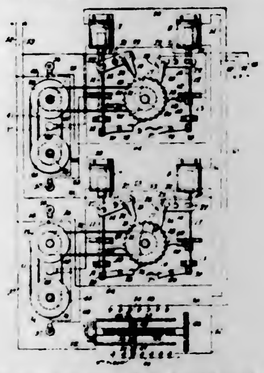
1. In a container for lip sticks or the like, a casing of casein or the like having a pair of

spirally arranged guideways molded directly upon its inner surface, each of said guideways comprising a pair of spiral spaced apart parallel ribs integral with, and projecting from, the inner surface of said casing, a rotatable shell disposed within said casing and having a pair of longi-



tudinally extending slots, a rotatable carrier disposed within said shell and adapted to have longitudinal movement therein, and a pin on said carrier and having its opposite ends respectively extending through said slots and engaging in said guideways.

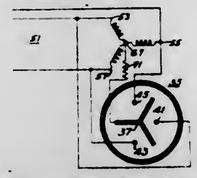
2,000,702
DOMESTIC TYPE STOKER
Frank W. Kay, Philadelphia, Pa., assignor to American Engineering Company, Philadelphia, Pa., a corporation of Pennsylvania
Original application November 2, 1928, Serial No. 317,045. Divided and this application March 14, 1930, Serial No. 435,856
3 Claims. (Cl. 110—109)



2. In a stoker, a hopper, a passage communicating at its forward end with said hopper and having top, bottom and side walls, the rear portion of said passage being horizontally flared, a ram operating in the forward portion of said passage for feeding fuel rearwardly through said passage, said ram having a wedge-shaped extension for feeding and spreading the fuel in said passage, a stationary spreading means secured to the bottom wall of said passage near the rear end thereof in substantially the same vertical plane with said wedge-shaped extension to cooperate therewith to spread the fuel in said passage, the bottom wall of the flared portion of said passage inclining downwardly toward the side walls from the central portion thereof for further spreading the fuel in said passage, and means for operating said ram.

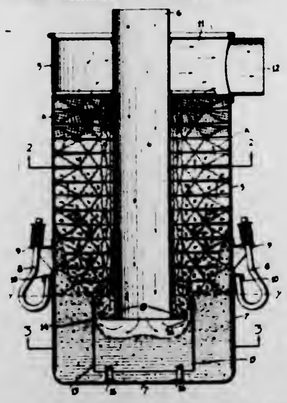
2,000,703
ELEVATOR CONTROL SYSTEM
Phillip C. Keiper, Chicago, Ill., assignor to Westinghouse Elevator Company, a corporation of Illinois
Application April 27, 1932, Serial No. 607,705
46 Claims. (Cl. 187—29)

1. In an elevator system, an elevator car operable in a hatchway, a plurality of sets of contact members associated with said system, an operator for each of said sets of contact members, each of said operators comprising a first element and a second element, certain of said first elements having characteristics such that they cooperate only with corresponding second elements, means for mounting said first elements on said car in substantially the same vertical line and means for mounting said second elements at predetermined points in said hatchway in substantially a vertical line for cooperation with said first elements, whereby said contact members may be selectively controlled in accordance with the position of said car by operators occupying a small cross-sectional area of said hatchway.



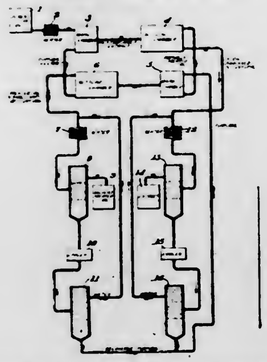
2,000,704
ELEVATOR APPARATUS
William L. Lademann, Bronx, N. Y.
Application February 19, 1931, Serial No. 516,863
9 Claims. (Cl. 187—29)

1. In elevator control, the combination of elevator car, floor selecting devices in the car, step by step floor switch mechanism in the car and connected with said floor selecting devices, means for operating said step by step switch mechanism in timed relation with the travel of the car and



position indicator signals in the car and controlled by said same step by step switch mechanism on the car.

2,000,705
PHOTOTUBE
Thomas H. Long, Irwin, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application January 17, 1931, Serial No. 509,377
4 Claims. (Cl. 250—27.5)



1. A photo-sensitive device comprising a plurality of collecting electrodes capable of being maintained at independent potentials and a light permeable photo-responsive emitting electrode, said emitting electrode electrically shielding certain of said collecting electrodes from certain others of said collecting electrodes.

2,000,706
AIR CLEANER
Wilfred W. Lowther, Minneapolis, Minn., assignor to Donaldson Company, Inc., St. Paul, Minn., a corporation of Minnesota
Application December 15, 1933, Serial No. 702,482
14 Claims. (Cl. 183—15)

1. An air cleaner comprising a casing having an oil well in its bottom and an air outlet in its upper portion, an air intake tube leading axially downward through said casing, a screen in the space within said casing surrounding said air intake tube, and an annular baffle in said oil well spaced from the walls and bottom of said well and from the lower end of said air intake tube, said annular baffle affording a chamber within said oil well that is unobstructed below the intake tube and, at its bottom has free and unobstructed communication with the bottom of said well, said annular baffle being extended to a point considerably above the lower end of said air tube and said screen being extended downward substantially to the upper edge of said annular baffle.

2,000,707
SOLVENT REFINING OF HYDROCARBON OIL
Robert E. Manley, Beacon, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application January 31, 1933, Serial No. 654,395
4 Claims. (Cl. 196—13)

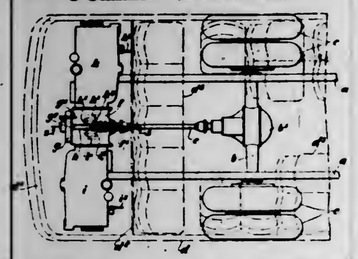
1. The method of recovering furfural from mixtures of furfural with hydrocarbon oils which comprises heating the furfural and oil in admixture with water to a temperature of from about 275° F. to about 325° F., effecting separation of the oil constituents from the furfural while maintaining the mixture at substantially such temperature, removing the separated oil, and cooling the remaining mixture to separate and recover the furfural.

2,000,708
RELEASE DEVICE FOR FLUIDS
Daniel Mapes, Upper Montclair, N. J., assignor to Walter Kidde & Company, Inc., New York, N. Y., a corporation of New York
Application November 7, 1931, Serial No. 573,636
10 Claims. (Cl. 169—11)

9. The combination with a plurality of containers of fluid under pressure, each having an opening, a closure for each opening and a fluid pressure operated fluid releasing device for opening each closure, a common fluid conducting line connected to each fluid pressure operated fluid releasing device and adapted to deliver operating fluid to each of the pressure operated fluid releasing devices and to receive fluid discharged from the plurality of containers upon operation of the respective fluid pressure operated fluid releasing devices, said fluid releasing device having a passage for establishing communication between said container and said fluid conduct-

ing line, normally positioned to coact with associated means for closing off communication between the said container and fluid conducting line whereby to prevent the passage of fluid therethrough when released from said container due to excess pressure developed in said container without operation of the fluid operated fluid releasing device of said container, the said fluid releasing device upon operation of the respective fluid pressure operated fluid releasing device by an operating fluid being moved to a position to render said coacting means ineffective so that communication is established between the container and the common fluid conducting line.

10. A releasing device for use in connection with a fluid container having an opening, a frangible closure member for the opening and penetrating means adapted to penetrate said closure member constructed to provide free discharge through said closure, comprising, a body forming a chamber, fluid operated means in said chamber operatively associated with said penetrating means, a single delivery connection for admitting a fluid under pressure to the space above the fluid operated means to operate the fluid operated means, means for delivering fluid from the container to the space above the fluid operated means when the fluid is released by operation of the penetrating means, and means normally obstructing the flow of fluid from the container to the space above the piston, said last named means being rendered ineffective upon operation of the penetrating means.



2,000,709

REAR ENGINE DRIVE FOR SELF-PROPELLED VEHICLES

Philip E. Matthews, Plainfield, N. J., assignor to International Motor Company, New York, N. Y., a corporation of Delaware

Application July 14, 1934, Serial No. 735,115

3 Claims. (Cl. 180—54)

1. In a vehicle having a rear driven axle, side frame members of a chassis supported thereon, final drive gearing in the axle disposed between said side frame members, a propeller shaft extending rearwardly from said final drive gearing parallel to the center line of the vehicle, a rearwardly extending body having a compartment located to the rear of said axle and extending the width of the body, two engines in said compartment disposed symmetrically at opposite sides of the propeller shaft, a transmission located between the proximate ends of said engines and to which said propeller shaft is operatively connected, a clutch located at the rear of the transmission and having a shaft section extending forwardly and in alignment with said propeller shaft, means to engage the said shaft section with said transmission, and a tubular shaft in which said last named shaft section is disposed connected operatively to the clutch and to said engines.

2,000,710

VACUUM THERAPY DEVICE

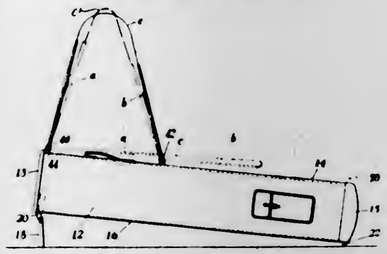
Carl G. Miller, New York, N. Y., assignor to Richard K. Parsell, Brooklyn, N. Y.

Application June 22, 1932, Serial No. 618,716

3 Claims. (Cl. 128—300)

1. A vacuum therapy device comprising a semi-rigid rubber flesh-contacting rim, a base, and a bellows between said rim and said base, said bellows including alternate substantially continuous sections of thin easily-flexible web-like sheet rubber on either side of a semi-rigid strengthening ring which ring is many times thicker than said sheet rubber, and said cup being bell-like in shape and collapsible upon itself so that said rim, said base and said strengthening ring become flush with one another when said cup is collapsed, the sheet rubber webs being foldable in appropriate folds between said rim, ring, and base.

2,000,711



GOLF BAG

Herbert Mobbs, Northampton, England

Application May 29, 1931, Serial No. 541,015

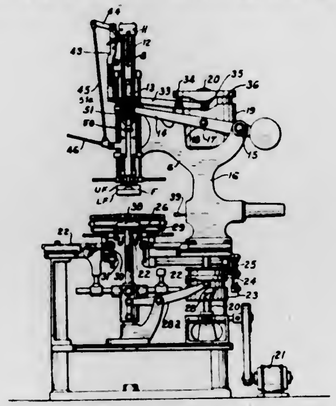
In Great Britain June 4, 1930

20 Claims. (Cl. 150—1.5)

1. In or for golf bags, a shoulder strap having in combination, end portions provided with a resilient strip of graduated flexibility and a relatively supple shoulder engaging part intermediate of said end portions.

20. In or for golf bags, a shoulder strap of flexible material having an end portion of substantial length made up of several thicknesses of the flexible material of which the shoulder strap is made, which several thicknesses are graduated in their dimensions.

2,000,712



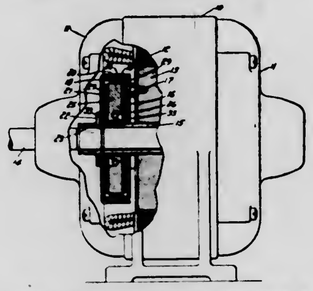
BOX MACHINE

Charles H. Nitsch, Philadelphia, Pa., assignor to Stokes and Smith Company, Philadelphia, Pa., a corporation of Pennsylvania

Application January 23, 1935, Serial No. 2,983

5 Claims. (Cl. 93—54)

1. A box machine comprising a form-block having separable components, an abutment movable with one of said components, mechanism operating during operation of said machine to separate said components, and means, normally inoperative, operable by an operator to separate said components comprising structure normally out of the path of said abutment, and means for moving said structure into engagement with said abutment and moving it to move said one of said components comprising a lever having an arm connected to said structure.



2,000,713

CLUTCH

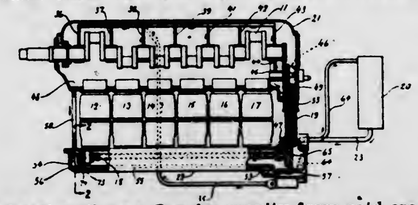
Marvin L. Norris, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York

Application May 10, 1929, Serial No. 362,007

39 Claims. (Cl. 192—105)

1. A clutch including two members arranged one within the other, one of said members having openings therein, friction elements arranged in the openings in the one of said members, and means including a centrifugal device frictionally connected to said driving member for urging said friction elements against the other of said members.

2,000,714



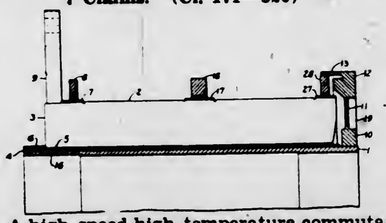
LUBRICATION SYSTEM

Arthur Nutt, Eggertsville, N. Y., assignor, by mesne assignments, to The Reed Propeller Co., Inc., Garden City, N. Y., a corporation of New York

Application April 10, 1930, Serial No. 443,042

16 Claims. (Cl. 184—6)

1. In a lubrication system for internal combustion motors, a plurality of motor cylinders, a crank shaft positioned above said cylinders, a case for enclosing said crank shaft, a cam shaft extending across said cylinders at the outer cylinder ends, a cam shaft housing enclosing said cam shaft and attached to said cylinders at their outer ends, and conduits connecting said crank shaft case and said cam shaft housing, whereby oil may flow by gravity from said crank shaft case to said cam shaft housing.



2,000,715

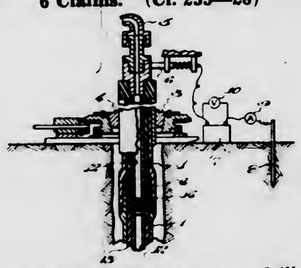
HIGH SPEED COMMUTATOR

Gaylord W. Penney, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application September 30, 1932, Serial No. 635,514

7 Claims. (Cl. 171—320)

1. A high-speed high-temperature commutator comprising, in combination, a support, a plurality of commutator segments, mounting means for securing corresponding ends to said support, said means being designed so that said other corresponding ends of the segments are spaced from the support and are subjected to a force tending to move the segments radially with reference to the support, and centering means for resiliently retaining said other corresponding ends in a given relative position, thereby preventing independent radial movement of the respective segments.



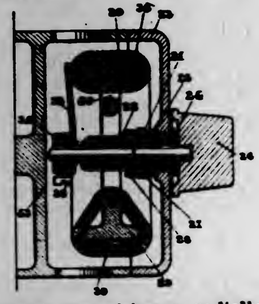
2,000,716

INSULATED ELECTRICAL CONNECTION

James V. Polk, Dallas, Tex., assignor to Geophysical Service Inc., a corporation of New Jersey

Application April 7, 1934, Serial No. 719,493

6 Claims. (Cl. 255—28)



1. In combination with a rotary drill pipe assembly, means for making an electrical connection between two sections of said drill pipe assembly, conductors disposed within each section of said rotary drill pipe and insulated therefrom, said means consisting of two metallic rings, one

of which is electrically connected to each of said conductors, and a metallic spring so arranged as to make connection between said rings when the two sections of drill pipe are joined together, and means for insulating said rings and said metallic spring from the said sections of drill pipe.

2,000,717
PROCESS FOR BREAKING PETROLEUM EMULSIONS
Claudius H. M. Roberts, Long Beach, Calif., assignor to Tretolite Company, Webster Groves, Mo., a corporation of Missouri
No Drawing. Application April 13, 1933, Serial No. 665,962
20 Claims. (Cl. 196—4)

1. A process for breaking a petroleum emulsion of the water-in-oil type, which consists in subjecting the emulsion to the action of a demulsifying agent comprising a substituted polyhydric alcohol body, in which at least one alcoholiform hydroxyl has been replaced by a polybasic carboxy acid body residue, and said polybasic carboxy acid body residue is characterized by the fact that at least one of its remaining acid hydrogens has been replaced by a hydrocarbon derivative residue, derived from a hydrogen body free from an acid hydrogen.

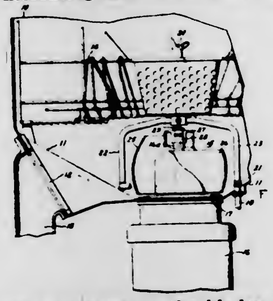
2,000,718
RHEOSTAT
Paul Schmitt, Paris, France
Application August 14, 1930, Serial No. 475,240
In France February 2, 1930
12 Claims. (Cl. 201—56)

1. A rheostat comprising a radially resilient helix of resistance wire of circular section wound in a plurality of turns of said helix, substantially circular means for supporting said helix, so that each of its turns lies in a radial position, a rotatable contact member mounted to slide across said resistance wire in the mean direction of the individual turns of wire and to compressively contact thereagainst, and said resistance helix being so mounted upon said supporting means that the individual turns of wire are free to yield resiliently upon the passage of the rotatable contact thereover.

2. A resistor, comprising an annular frame, a plurality of grooves distributed about the outer periphery of said frame, the inner periphery of said frame having half the number of grooves of the outer periphery, and the said frame having a circular row of holes extending therethrough, of like number as the number of grooves on the inner periphery, and in staggered relation with respect thereto, a coiled resistance wire wound in helical manner about said frame, alternate inner turns of said coil extending through one of said holes and then resting in one of the grooves of the inner periphery of said frame, all of the outer turns resting in the grooves of the outer periphery, the said frame having a T-shaped section, so that no contact exists between the frame and the resistance wire except where the latter engages with said grooves and holes, and a rotatable contact member contacting the said resistance wire.

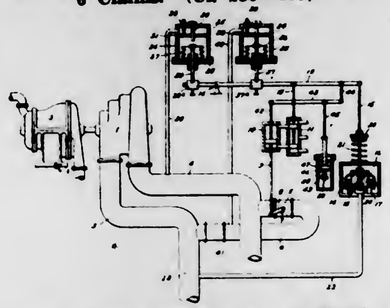
3. A rheostat comprising supporting means provided with grooving, the axis of said grooving being sinuate, a resilient contact adapted for moving across the axis of said grooving, and resilient conducting means disposed in said grooving and adapted for pressing against said contact, the contacting area of said conducting means being restrained by the side walls of said grooving from moving in the direction of motion of said contact but being otherwise unrestrained, the walls of said grooving being sufficiently high to support said resilient contact at least in part as said contact moves from one portion of said grooving to another, but without lifting said contact away from said conducting means.

2,000,719
POROUS LIGHTNING ARRESTER
Joseph Slepian and Ragnar Tanberg, Pittsburgh, and Charles E. Krause, Greensburg, Pa., assignors to Westinghouse Electric and Manufacturing Company, a corporation of Pennsylvania
Application July 22, 1929, Serial No. 379,899
44 Claims. (Cl. 175—36)



2. A lightning arrester for an electrical device to be protected, said arrester comprising a composite porous block having pores, the boundaries of said pores including conducting particles in such limited quantities as to carry, at the rated normal voltage of the arrester, a leakage current of not over about 10 amperes, the size and degree of conductivity of the pores which carry the discharge, as indicated by the cut-off and breakdown voltages, being such that the breakdown voltage is not over four times the cut-off voltage of the arcs or discharges through the pores, the cut-off voltage of the arrester being less than about 140 per cent of the rated operating voltage of the device to be protected.

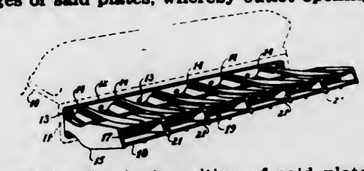
9. A lightning arrester comprising a block of porous body-material having a coating of condensed vapor of a conducting material throughout its pores and surfaces, said coated block having a resistivity of something of the order of 1,000,000 ohms per centimeter cube or less, but more than 1000 ohms per centimeter cube, at a potential gradient of 400 volts per centimeter.



2,000,720
IMPELLER
Carl M. Snyder, Glen Ellyn, and Forrest A. Walker, Oak Park, Ill., assignors to Walker Dishwasher Corporation, Chicago, Ill., a corporation of Delaware
Application December 5, 1933, Serial No. 700,944
3 Claims. (Cl. 299—63)

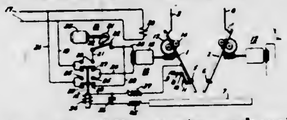
1. In a dishwashing machine provided with a vat and a dish-supporting rack within said vat, a rotary fluid circulating impeller adapted to be operated within said vat below said rack comprising a hub, a pair of blades on said hub, each having a fluid engaging face curving downwardly and forwardly from its upper to its lower edge in the direction of rotation of the impeller with gradually diminishing radii so that each blade when it engages washing fluid in said vat deflects said fluid upwardly within said vat, the blades gradually increasing the vertical deflection of said

fluid as the fluid flows up the blades, the lower edges of said fluid engaging faces lying in substantially the same plane and the upper edge of the fluid engaging face of one of said blades being materially below the upper edge of the other so that fluid is deflected upwardly by said one blade through a smaller vertical angle than the fluid deflected by the other blade.



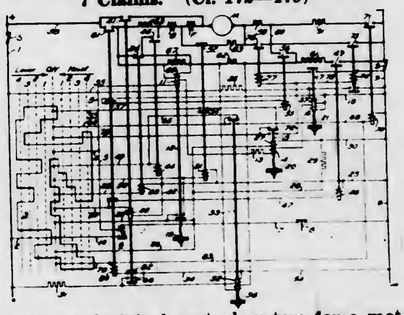
2,000,721
CENTRIFUGAL COMPRESSOR
Reginald G. Standerwick, Marblehead, Mass., assignor to General Electric Company, a corporation of New York
Application October 26, 1932, Serial No. 639,571
6 Claims. (Cl. 230—115)

1. The combination with a centrifugal compressor having a pulsation preventing valve and means for opening and closing it in accordance with the resultant of the rate of flow through the compressor and the discharge pressure from the compressor, of means for further controlling the opening and closing of the valve in accordance with the rate of flow past it.



2,000,722
EXHAUST MANIFOLD
Colby W. Steward, Kenmore, N. Y., assignor to Curtiss Aeroplane & Motor Company, Inc., a corporation of New York
Application January 6, 1933, Serial No. 650,467
8 Claims. (Cl. 60—29)

1. A unit exhaust manifold for a multi-cylinder engine comprising an upper longitudinal plate, a lower longitudinal plate, a plurality of means for joining said plates between the successive engine cylinder exhaust ports, said means being adapted for attachment to said cylinders, and a plurality of partitions for joining the outer edges of said plates, whereby outlet openings are



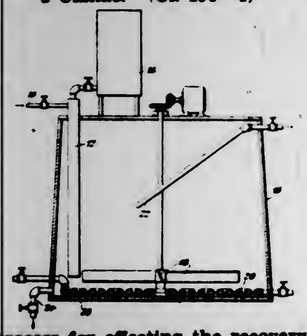
formed by the juxtaposition of said plates and of said partitions, and whereby a longitudinal passage is formed by the boundaries established by said upper and lower plates, said means, and the inner edges of said partitions.

2,000,723
WELDING SYSTEM
Chauncey G. Suits, Scotia, N. Y., assignor to General Electric Company, a corporation of New York
Application December 29, 1934, Serial No. 758,375
5 Claims. (Cl. 219—8)

1. In an arc welding system wherein means are provided for feeding an electrode to compensate for its consumption by the welding arc, means including an electric motor for operating said feeding means, means responsive to an arc voltage greater than a predetermined value for intermittently energizing said motor for rotation in the proper direction to impart a forward feeding rate to said electrode slightly greater than its rate of consumption by the arc, and means responsive to an arc voltage less than said predetermined value for continuously energizing said motor for rotation in the reverse direction.

2,000,724
CRANE HOIST CONTROL
Frank P. Taugher, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 30, 1932, Serial No. 635,530
7 Claims. (Cl. 172—179)

1. In an electrical control system for a motor, in combination, a motor, a source of energy having a given voltage, said motor having an



armature winding and a field winding, a controller, means responsive to said controller for selectively connecting said field winding and armature winding in series circuit relation and in parallel circuit relation without reversing the armature energization for the parallel circuit connection, means for progressively decreasing the effective resistance of the armature winding, means for progressively increasing the effective resistance of the field winding, and means for limiting the rate of change of said respective effective resistances.

2,000,725

BREAKING OF OIL-WATER EMULSIONS

John Charles Walker, Eldorado, Kans., assignor, by mesne assignments, to The Tretolite Company, Webster Groves, Mo., a corporation of Missouri

Application December 5, 1921, Serial No. 519,842
3 Claims. (Cl. 196—4)

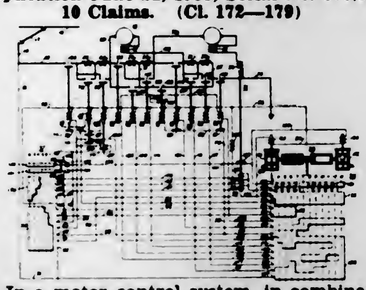
3. A process for effecting the recovery of the oil of a petroleum emulsion, characterized by subjecting the emulsion to the action of a treating agent comprising a non-saponaceous, non-saponifiable, fatty derivative which bears a simple genetic relationship to its parent material, mixed with a water-soluble fatty derivative with an oil-soluble fatty body.

2,000,726

TRAIN AUTOMATIC AIR CONNECTER

Jay J. Weber, Tulsa, Okla.

Application May 21, 1934, Serial No. 726,807
4 Claims. (Cl. 284—5)



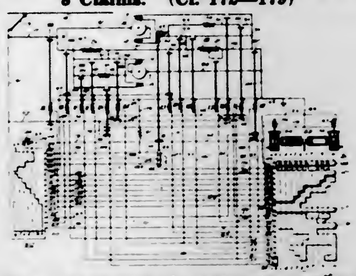
1. A coupling of the character described comprising a pair of heads having stems, the heads being laterally angled with relation to the stems, means for suspending the stems beneath the coupling ends of cars for the slidable displacement of said stems, means for tensioning the stems, half-ball fittings movably held in the heads for engagement with each other, tapered guide noses on the heads, eyes on said heads receiving the said noses and having tapered formations corresponding to the latter for the bringing together of the half-ball fittings, retaining rings seated in the heads for the half-ball fittings, nipples carried by the fittings and movably locked with the rings, and air line connections with said nipples.

2,000,727

MOTOR CONTROL SYSTEM

Norman H. Willby, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 21, 1933, Serial No. 676,845
10 Claims. (Cl. 172—179)



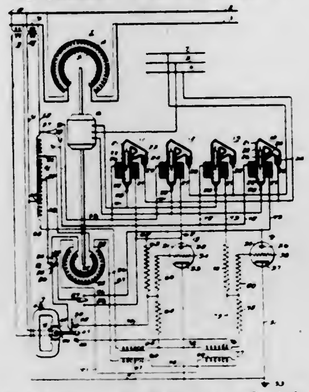
1. In a motor-control system, in combination, a motor, a source of power for the motor, switching means for connecting the motor to the power source, a plurality of resistor sections connected in series-circuit relation and in series with the motor to control the motor current, a plurality of separately operable switches for shunting the resistor sections, means for automatically accelerating the motor, a controller for controlling the energization of said switching means and said resistor-shunting switches independently of the automatic accelerating means, and electrical interlocking means associated with said switches for preventing the motor from being disconnected from the power source while the resistor-shunting switches controlled by the controller are closed.

2,000,728

CONTROL SYSTEM

Norman H. Willby, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 21, 1933, Serial No. 676,846
8 Claims. (Cl. 172—179)



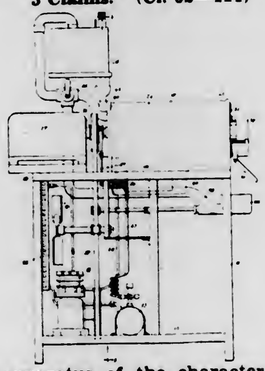
3. In a motor control system, in combination, a motor having a field winding, a source of power for the motor, means for varying the current in the field winding of the motor to vary the motor speed, means for automatically controlling the acceleration of the motor, a relay having a coil energized by the armature current of the motor for controlling the operation of the acceleration-controlling means, means on said relay responsive to the field strength of the motor for causing the tractive effort of the motor to be maintained at a predetermined value, and a master controller for governing the operation of said relay.

2,000,729

ELECTRICAL CONTROL SYSTEM

Edward R. Wolfert, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 29, 1933, Serial No. 678,221
3 Claims. (Cl. 171—119)



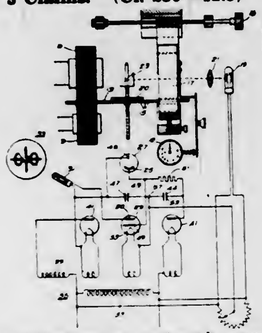
1. In a system comprising an electrical circuit, a regulator having a movable member for adjusting a characteristic of said circuit, a motor adapted to actuate said member to any point within predetermined limits of travel, forward and reverse energizing circuits for said motor, a grid-controlled electronic tube adapted to control each of said circuits, means for supplying grid potentials to said two tubes, and means responsive to said circuit characteristic for adjusting said potentials, the combination of selective means for oppositely varying said tube grid potentials in accordance with the departure of said movable member from a predetermined intermediate or neutral position to thereby cause the motor to return said member to said neutral position.

2,000,730

AUTOMATIC FREEZING AND DISPENSING APPARATUS

Edward F. Wortmann, Jersey City, N. J.

Application May 9, 1933, Serial No. 670,115
5 Claims. (Cl. 62—114)



1. In apparatus of the character set forth: a freezing drum, a displacement cylinder rotatably mounted within the same to provide an intermediate reduced annular and cylindrical mixing space, the periphery of said cylinder being provided with suitable beater and scraper elements longitudinally disposed thereon and displaced circumferentially thereover, means to introduce at one end of the mixing space a mix to be frozen, means to withdraw the congealed mix from an opposite end of the space, means to rotate said cylinder, and cooling means associated with the drum.

2,000,731

METER

Douglass A. Young, East Orange, N. J., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

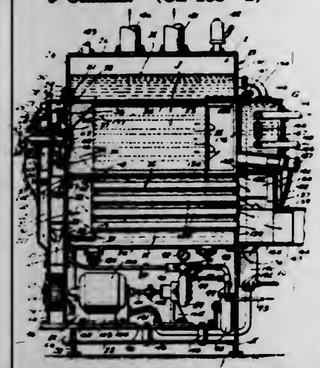
Application August 25, 1932, Serial No. 630,341
3 Claims. (Cl. 250—41.5)

1. In combination, a network comprising a plurality of capacitors and assymmetric conducting means connected in series, an alternating current source, means for coupling said source to said networks to charge said capacitors, an electric discharge device having a control electrode and a plurality of principal electrodes, means for connecting said principal electrodes between the junction point of said asymmetric conducting means and one of said capacitors and the junction point of said capacitors and means for varying the potentials impressed between said control electrode and said principal electrodes, said means including means responsive to external physical disturbances and means for connecting said responsive means between said control electrode and a junction point of one of said capacitors and said asymmetric conducting means.

2,000,732

THREADED CONNECTION

Elmer J. Zelt, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York



Application February 1, 1934, Serial No. 709,310
1 Claim. (Cl. 85—36)

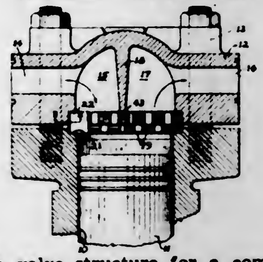
The combination with a wall of an electrical apparatus casing, of a bushing having an externally helically threaded portion and an external flange, said wall having an opening to receive said bushing, the edge of the wall around said opening being in the plane of the wall and having a minor diameter smaller than that of the threads and a major diameter greater than that of the threads, and said wall being thinner than the pitch of the threads.

2,000,733
BURNER INSTALLATION FOR DOMESTIC BOILERS

Edgar T. Avery, Maplewood, N. J.
Application April 13, 1933, Serial No. 665,882
9 Claims. (Cl. 158—1)

1. A furnace front construction for a furnace of the type having a combustion chamber, a plurality of conduits receiving the hot combustion gases from said combustion chamber, the heat in the combustion gases being extracted in large part during the passage through said conduits and a flue chamber at the front of the furnace to receive the combustion gases from said conduits after considerable heat has been extracted from them, said construction comprising an air receiving casing with an outside primary air conduit compartment for receiving and feeding cool air and an inside secondary air conduit compartment, in heat exchange relationship with said flue chamber, for feeding heated air, a longitudinally extending cylindrical oil spray device passing through said casing, a substantially cylindrical air-directing shell encircling said device extending across said casing from front to back and having inlet openings from said primary compartment at its end away from the furnace, the other end of said shell being provided with an outwardly diverging mouth, the secondary air passing around the periphery of said mouth.

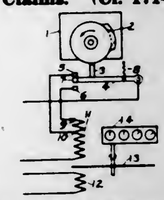
2,000,734
FISH LURE



Anthony C. Accetta, Cleveland, Ohio
Application January 11, 1933, Serial No. 651,172
8 Claims. (Cl. 43—42)

1. In an artificial lure, the combination of a spoon-like body comprising front and rear sections, a flexible and detachable connection between the sections, means at the front end of the front section whereby it may be connected to a fishing line, and flexible wings projecting laterally from one of the sections.

2,000,735
VALVE STRUCTURE FOR COMPRESSORS AND PUMPS

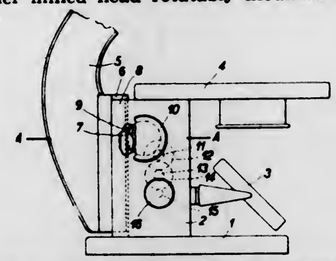


Edwin E. Arnold, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 8, 1933, Serial No. 670,615
17 Claims. (Cl. 230—231)

1. In a valve structure for a compressor or pump, a valve assembly adapted to be clamped between the cylinder and the cylinder head of the compressor or pump, said valve assembly comprising a plurality of valve plates arranged in face-to-face relation and a gasket sheath encompassing the peripheries of said valve plates and having flanges turned in against the outer faces of the valve plates to form gaskets between said outer faces and the cylinder and the cylinder head, respectively.

2,000,736
MULTIPLE-RATE POWER METERING

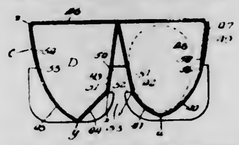
John Perry Ballantine, Seattle, Wash.
Application November 19, 1932, Serial No. 643,395
7 Claims. (Cl. 171—268)



4. In a multiple rate metering system the combination of a tapped voltage coil and contact making means for changing said taps.

2,000,737
MICROSCOPE STAND

Walther Bauersfeld, Jena, Germany, assignor to the firm of Carl Zeiss, Jena, Germany
Application December 7, 1933, Serial No. 701,263
In Germany December 13, 1932
2 Claims. (Cl. 88—39)

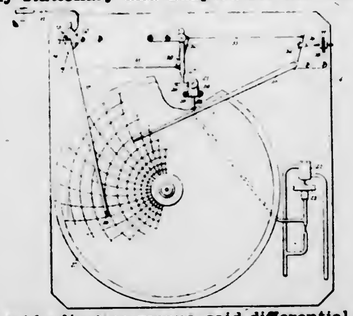


1. A microscope stand comprising a foot, a milled head rotatably mounted in the foot, a toothed wheel connected to the milled head, a rack displaceably mounted on the foot, a toothed wheel rotatably mounted in the foot and meshing with the rack, a gear consisting of a plurality of toothed wheels disposed between the toothed wheel connected with the milled head and the toothed wheel in mesh with the rack, another milled head rotatably mounted in the

foot, and driving means disposed between this other milled head and the rack.

2,000,738
EGG CARTON

Leon Benoit, Chicago, Ill.
Application August 31, 1931, Serial No. 560,285
3 Claims. (Cl. 229—29)



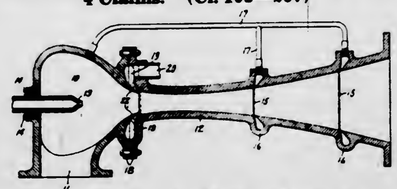
1. A container in which is comprised a blank having aligned series of slots, together with parallel bends defining front and rear walls with intermediate pairs of slanting bottom walls, together with connected partition walls extending centrally of the container, and a plurality of separable, bifurcated cross walls, one for each series of slots, and each wall provided in its body with a central truncated opening with opposite slanting edges and a base formed of two aligned but spaced shoulders between which an entrance slot is extended through to the bottom edge of the cross wall, there being also at each of the opposite edges of the cross wall a further shoulder, the blank being assembled with the cross walls in such manner as to receive one of the latter through each of the aligned series of slots with unslotted portions of the blank accommodated within the truncated opening adjacent its opposite slanting edges and supported upon the shoulders thereof, and with other unslotted portions of the blank rested against the shoulders at opposite edges of each portion of the bifurcated cross wall whereby intervening portions of the blank are suspended in distended relation above the bottom plane of the cross walls.

2,000,739
CONTROLLER APPARATUS

Carlton W. Bristol, Naugatuck, and Perry A. Borden, Waterbury, Conn., assignors to The Bristol Company, Waterbury, Conn., a corporation of Connecticut
Application August 29, 1933, Serial No. 687,328
15 Claims. (Cl. 236—82)

12. In combination: an element responsive to changes in magnitude of a condition to be controlled and measured and means to measure the response of said element to changes in magnitude of the condition, a control couple embodying a movable member and a cooperating fixed member having an orifice with which the movable couple is adapted to cooperate in bleeding a fluid supply, means for adjusting the position of the movable member relatively to said orifice, and differential mechanism having a part normally stationary and adapted for movement by

the said adjusting means, said differential mechanism serving to connect the adjusting means to said movable member and the latter with the responsive element.



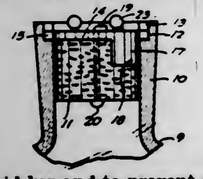
2,000,740
ALKALI METAL ALLOY

Dorothy Hall Brophy, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
No Drawing. Original application August 26, 1930, Serial No. 477,975. Divided and this application September 8, 1934, Serial No. 743,305
3 Claims. (Cl. 75—1)

1. An alkaline earth metal-aluminum-caesium alloy which yields caesium on vacuum distillation.

2,000,741
FLUID JET PUMP

Bruce O. Buckland, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application October 26, 1933, Serial No. 695,249
4 Claims. (Cl. 103—267)



1. In a jet pump, a casing defining a suction chamber with an inlet for fluid to be conveyed and a discharge conduit having a flaring diffuser portion, a nozzle for discharging a jet of impelling fluid into the chamber in the direction of the axis of the conduit, and conduit means connected to the flaring portion for removing a slowly moving boundary layer of fluid in said flaring portion to maintain stability during operation.

2,000,742
BOTTLE CLOSURE

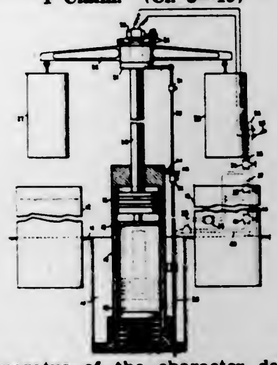
Carl G. Carlberg, Omaha, Nebr.
Application August 14, 1934, Serial No. 739,738
3 Claims. (Cl. 215—34)

1. In a closure device for the neck of a container, said neck near its top being provided with a slot, a cork disposed non-revolubly in said neck and having a recess opening on its top,

an apertured cap in said neck engaging in said slot and provided with a lug, and a lifting-member extending from the cork through the aperture of the cap and adapted to be moved for moving the cork to permit the recess thereof

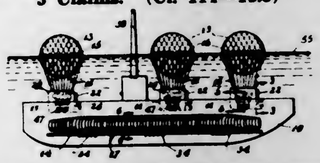
to receive said lug and to prevent rotation of the cap, said neck being frangible to permit breakage of the walls of the slot for removal of the cap therefrom and permitting removal of the cork from said neck.

2,000,743
ELECTRICAL DEVICE FOR AUTOMOBILES
Joseph H. Cohen, Bridgeport, Conn.
Application December 29, 1932, Serial No. 649,277
7 Claims. (Cl. 240—7.1)



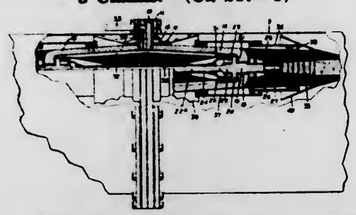
1. In a device of the character described, the combination of a support adapted to be connected to the header board in the driver's compartment of an automobile; an arm carried by the support; a casing carried by said arm, said casing having at one place thereon a heating element and at another place thereon a lamp; and a connection between the arm and the casing to permit rotation of the casing about the axis of said arm to bring either the heat from the heating element or light from the lamp to be directed to the desired place.

2,000,744
WHEEL WRENCH
Tom J. Davies, New York, N. Y.
Application January 22, 1934, Serial No. 707,732
3 Claims. (Cl. 81—111)



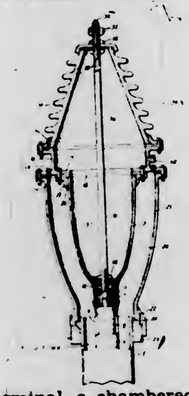
3. A wheel wrench, comprising a stationary substantially U-shaped jaw connected with a handle, a movable jaw pivotally mounted on the end of one of the arms of said U-shaped jaw and having a beak portion extending to the front of the end of said arm for moving inwards to grip the rim of a wheel in conjunction with the other arm of said U-shaped jaw and also having a tail portion extending to the base of said U-shaped jaw for being moved when the wrench is engaged with the rim of a wheel between the arms of the U-shaped edge for moving the movable jaw to move the beak portion into gripping position, and means for preventing said tail portion from moving out from between the arms of said U-shaped jaw, comprising a removable element on said tail portion engaging one of the arms of said U-shaped jaw to limit outward pivoting of the movable jaw, and the pivotal mounting of said movable jaw located in a slot opening towards the other jaw, said removable element comprising a screw.

2,000,745
BOIL-OFF OR DYEING APPARATUS
Albert E. Demol, Paterson, N. J.
Application April 7, 1933, Serial No. 664,964
1 Claim. (Cl. 8—19)



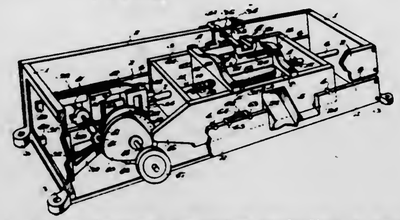
In apparatus of the character described: a rotatably mounted cross-head, reels adapted to be suspended from opposite ends thereof, a pair of liquid-containing tanks with which the opposite ends of the cross-head may be vertically aligned to receive the reels suspended from the said ends, a cylinder, a piston reciprocable therein, a piston rod extending through the cylinder to afford a vertical support for the said cross-head and secured against rotation relatively to the cylinder, means to admit fluid under pressure to said piston, means to exhaust fluid therefrom, and an electric motor carried by the piston rod at its outer end and geared to the cross-head for rotating the same about the vertical axis of said piston rod to position the reels with respect to the said tanks.

2,000,746
AUTOMATIC SUBMARINE SAFETY APPARATUS
Michael Dray, Bronx, N. Y.
Application April 21, 1934, Serial No. 721,665
5 Claims. (Cl. 114—16.3)



1. A submarine safety apparatus, comprising a submarine having a body with a plurality of cavities in the top and the sides, deflateable and inflateable bags in said cavities, means for holding said bags in extended positions from said cavities when inflated, doors for said cavities, and means within the submarine for inflating and deflating said bags, comprising a plurality of storage tanks for storing compressed air and an air compressor for supplying air to said tanks, and a piping system including valves whereby air in the inflated bags may be removed by the air compressors and rediscarged into said storage tanks.

2,000,747
FLUID STOP JOINT
Eugene D. Eby, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application November 6, 1934, Serial No. 751,691
8 Claims. (Cl. 247—3)



1. A fluid stop joint for cables comprising a pair of cables arranged end to end, enclosures for the cables each filled with a fluid under pressure, a joint casing connected at its ends to the enclosures, a transverse partition in the casing having an opening, a pair of chambered insulators mounted one on each side of the partition, each of said insulators being subjected to an external fluid pressure from one of the cable enclosures, a connector means extending through both insulators and also the opening in the partition for uniting the cables electrically, means securing the ends of the connector means to the insulators and forming fluid tight seats, and conduit means formed in the partition for introducing fluid under a positive pressure into the chambers of both insulators where, acting on the internal walls thereof, it serves to compensate in part for the pressures exerted by the fluids from the enclosures of the two cables.

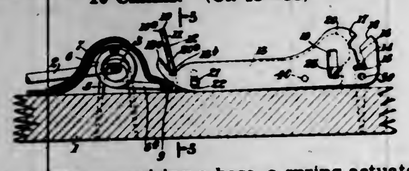
2,000,748
TERMINAL FOR ELECTRIC CABLES
Frank W. Engster, Troy, N. Y., assignor to General Electric Company, a corporation of New York
Application February 9, 1934, Serial No. 710,482
9 Claims. (Cl. 247—6)

1. In a terminal, a chambered casing capable of withstanding high bursting stress, a closing means for one end of the casing, a hollow insulator located within the chamber of the casing, a body of fluid under high pressure within the chamber of the casing exerting compression pressure on the material of the insulator, a conduit admitting fluid to the casing, a cable located inside of the conduit, a connector means extending from the cable through the insulator to the outside thereof, and means supplying fluid under positive pressure to the inside of the insulator whereby the wall thereof is subjected to differential pressures.

2,000,749
NUT CRACKING MACHINE
Oliver H. Franklin, Tyler, Tex., assignor of one-half to T. A. Hudson and Emma E. Hudson, Tyler, Tex.
Application March 27, 1933, Serial No. 662,863
5 Claims. (Cl. 146—12)

1. A nut cracking machine including a reciprocating nut receiving means and a stationary mandrel, said nut receiving means comprising plates having their lower extremities outwardly channeled to jointly define an open ended chamber when in operative position, said plates being hinged opposite said chamber for relative movement, an independently advanceable pressure plunger arranged to yieldingly enter the ends of said chamber to engage a nut therein during movement of the latter in one direction, means for locking said plunger for positive movement against said nut and means for applying pressure against said plunger to crack the shell of said nut.

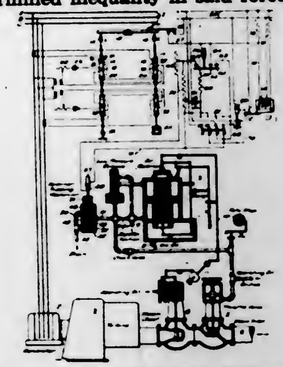
2,000,750
BAILER
Paul G. Gates, Long Beach, Calif.
Application May 6, 1933, Serial No. 669,707
15 Claims. (Cl. 166—19)



1. A bailer comprising means providing upper and lower chambers telescopically connected together, a one way valve permitting ingress to the lower chamber, and a slide valve between the chambers operable by telescoping movement between the chamber forming means for establishing and breaking communication between the chambers.

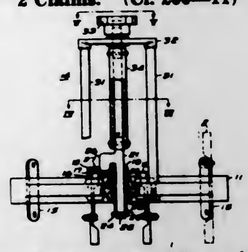
2,000,751
PUTTY SOFTENER
Oscar P. Glick, Denver, Colo.
Application February 12, 1934, Serial No. 710,819
2 Claims. (Cl. 219—21)

1. A device for softening putty in a window sash comprising: a relatively long backing member; insulating strips extending longitudinally of said backing member along one face thereof; and an electrical heating element contained in grooves of said insulating strips, there being a longitudinal slot exposing said heating element throughout the length of said strip, said slot being of a width less than the diameter of a heating element.



2,000,752
ANIMAL TRAP
Hershey Roy Graybill, Lititz, Pa., assignor to Animal Trap Company of America, Lititz, Pa., a corporation of Pennsylvania
Application September 13, 1934, Serial No. 743,795
10 Claims. (Cl. 43—83)

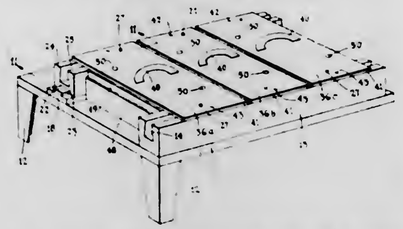
1. A trap comprising a base, a spring actuated striker pivoted thereto, a pivoted bait pedal having a portion provided with a trigger, a locking bar provided with a pivotal aperture and a setting shoulder, and locking detent for engaging the striker and a trigger engaging portion, a staple engaging the pivotal aperture of the locking bar, one of the contiguous faces of said locking bar and one leg of said staple being provided with a projection located adjacent to said aperture, and at all times contacting with the other of said contiguous faces.



2,000,753
ELECTROMAGNETIC OVER-SPEED PROTECTION
Samuel B. Griscom, Pittsburgh, and Homer C. Nyman, Wilkinsburg, Pa., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 11, 1933, Serial No. 670,486
19 Claims. (Cl. 290—40)

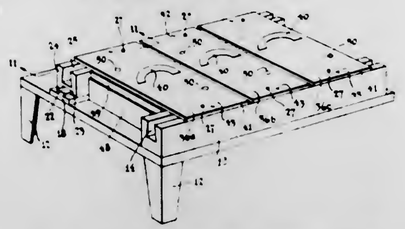
15. Protective mechanism for a synchronous transmission system including a transmission line, a generator, a prime mover for the generator, input-regulating means for the prime mover, and a speed-governor for controlling the input-regulating means, said protective mechanism comprising a transient-anticipator mechanism, electro-responsive means responsive to said transient-anticipator mechanism for taking over the control of said input-regulating means for a brief predetermined time, effecting a control operation in the proper direction before the speed-governor would have had time to act, and subsequently, at the conclusion of said brief predetermined time, restoring the control of said input-regulating means to said speed-governor, said transient-anticipator mechanism comprising means for producing a force responsive quickly to a predetermined suddenly variable electrical quantity of said machine, means for producing a normally substantially equal force responsive, but only sluggishly, to the same suddenly variable electrical quantity, and means including a contact-member for responding to a predetermined inequality in said forces.

16. An electrical metering instrument comprising an electric contact member, a spring biased to close said contact member, a spring biased to open said contact member, a separate electro-responsive member for biasing each spring, means for causing one of said electro-responsive members to move slowly and the other to move quickly, in response to a sudden electrical change, and means for slightly biasing said contact member toward a normal predetermined position.



2,000,754
VARIABLE RATIO TRANSFORMER
Henry C. Guhl, Haven, Kans., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 6, 1933, Serial No. 692,460
2 Claims. (Cl. 200—11)

2. A ratio adjuster comprising a base plate, a plurality of contact studs supported by said base and equally spaced in an arc about a central axis, a moving contact member having an opening therein, an operating shaft extending along said axis and through said opening and operatively connected to said movable contact member to operate it from one operative position to another, and means for biasing said movable contact member toward said contact studs, said movable contact member being of sufficient width to engage two adjacent studs and having

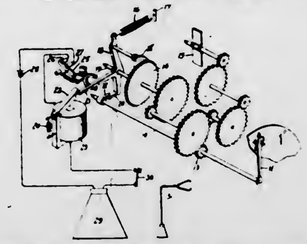


recesses therein spaced to receive the contacting portions thereof and having a supporting leg extending therefrom toward and engaging with said base plate on the side of the shaft remote from the contact engaging portion thereof, the opening in said movable contact member being sufficiently large to permit said member to rock slightly when moved from one operative position to another to insure positive engagement thereof with said contact studs.

2,000,755
DEVICE FOR FORMING PLATE GANGS FOR MULTICOLOR PRINTING
Bernard F. Heck, St. Paul, Minn.
Application June 27, 1932, Serial No. 619,367
14 Claims. (Cl. 113—99)

14. A device for forming plate gangs for multicolor printing from plates having gauge means thereon, said device comprising a pair of spaced supports for the plates of a gang, and gauge means on one of said supports adapted to cooperate with the gauge means on the plates of the various gangs and thereby provide for a definite predetermined relationship between plates in the different gangs.

2,000,756
METHOD OF FORMING PLATE GANGS FOR MULTICOLOR PRINTING
Bernard F. Heck, St. Paul, Minn.
Original application June 27, 1932, Serial No. 619,367. Divided and this application September 23, 1933, Serial No. 690,687
6 Claims. (Cl. 101—401.2)

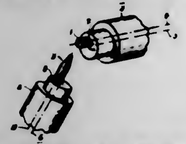


4. The method of forming plate gangs for multi-color printing which consists in drilling gauge holes in the several plates of a gang in identical positions relative to the register marks thereon, in mounting the plates upon a support having gauge pins thereon arranged to enter the gauge holes in the plates with portions of the plates superimposing a backing, in drilling holes through the dead metal of said plates, in casting keys into said holes and to said backing to hold the plates attached to the backing, and in removing the formed gang en bloc from said support and gauge pins.

2,000,757
DETACHABLE CONNECTER
Michael Holczer, Cleveland, Ohio
Application March 9, 1934, Serial No. 714,861
5 Claims. (Cl. 85—8)

1. A combination pin and lock wherein the pin is adapted to fit into an opening and wherein the lock is adapted to prevent the pin from working, or otherwise escaping, out of the opening, comprising a pin having a reduced portion, a major and a minor jaw hinged to each other at one end and adapted to engage the said reduced portion of the pin, the arrangement of the major and minor jaw being such that the major jaw is provided with an off-set extension which extends beyond the end of the minor jaw, and which is wider than the major jaw and is so positioned that its lateral edges are substantially in alignment with the lateral edges of the major and minor jaws when they are in their closed position, securing means adapted to slidably engage the said extension, said securing means being also adapted to slidably engage the major and minor jaws to secure them in their closed position, and means for retaining the securing means in its engaging position to secure the major and minor jaws in their closed position, whereby the arrangement of the jaws and securing means locks the pin against escaping from the opening.

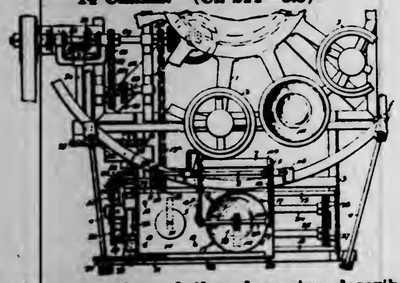
2,000,758
TIMER
Philip E. Hosegood, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application May 29, 1933, Serial No. 673,496
1 Claim. (Cl. 177—386)



A timer for determining distances by the sound echo method, comprising a dial graduated in distance units, a time shaft having a pointer cooperating with said dial, a stop for said shaft for stopping the pointer at a predetermined indication on said dial, a speed multiplying gear train having a ratchet driving wheel at the low speed end and a speed controlling governor driven from the high speed end thereof, said train being connected in driving relation with said time shaft at an intermediate point so as to cause the time shaft to make one complete revolution for the advancement of the ratchet wheel a distance of one of its teeth, a ratchet pawl and operating lever for advanc-

ing said ratchet wheel, a spring secured to said lever and tensioned when the lever is moved to retract said pawl for supplying energy to drive said gear train, means operated by the last mentioned movement of said lever for disengaging the stop for the time shaft, sound-producing means and a relay included in an electric circuit, a manual energizing switch and an automatic deenergizing switch in said circuit, said relay when energized moving said lever to retract said pawl, tension said spring, release said time shaft, and open said automatic switch.

2,000,759
METHOD OF CURING CONCRETE
Arthur A. Johnson, Great Neck, N. Y.
No Drawing. Application April 15, 1933, Serial No. 666,253
9 Claims. (Cl. 25—154)

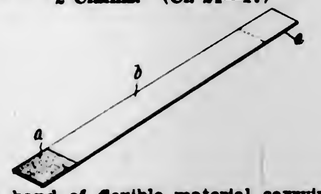


1. The method of curing concrete, which consists in covering the exposed surfaces of the concrete to be cured with a mixture of bitumen and rubber.

2,000,760
ARC LAMP PROJECTOR
Johannes Kiefer, Berlin-Charlottenburg, Germany, assignor to General Electric Company, a corporation of New York
Application January 19, 1933, Serial No. 652,544
In Germany January 28, 1932
4 Claims. (Cl. 176—66)

1. In an arc lamp, the combination of a reflector, a pair of cooperating electrodes, said electrodes being respectively movable laterally in relation to fixed axes, at least one of said axes coinciding with the focal axis of said reflector, and means for continually moving said electrodes during operation of said lamp.

2,000,761
DEVICE FOR FEEDING PLATES ONTO A CONVEYER
John F. Kohler, White Plains, N. Y.
Application May 31, 1933, Serial No. 673,707
14 Claims. (Cl. 214—8.5)

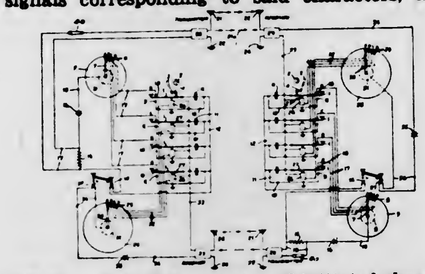


1. An apparatus of the character described, including means for supporting a stack of plates in proximity to a traveling support, a shaft, arms carried thereby, an electromagnet carried by said arms and adapted to take a plate from said stack and deliver it onto said support, a gear on said shaft, a rack bar for operating said gear, a second shaft having crank means for operating said rack bar, a revolvable circuit controlling member mounted on said second shaft and brushes co-operating with said circuit controlling means whereby said electromagnet will be alternately energized and de-energized by the action of said circuit controlling means.

2,000,762
FLUID JET PUMP
Hans Kraft, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application October 26, 1933, Serial No. 695,299
4 Claims. (Cl. 103—267)

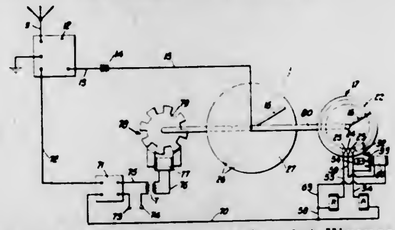
1. In a jet pump, a casing defining a suction chamber having an inlet and a discharge conduit with a flaring portion, a nozzle projecting into the suction chamber for discharging an impelling fluid in axial direction of the discharge conduit, and means for impelling a boundary layer of slowly moving fluid in the flaring portion of the discharge conduit comprising a ring of auxiliary nozzles for discharging impelling fluid in tangential direction along the wall of the flaring portion of the discharge conduit.

2,000,763
BAND
John D. Lane, Boston, Mass., assignor to Ralph H. Wilbur, Melrose, Mass.
Original application filed September 2, 1933, Serial No. 687,951. Divided and this application May 5, 1934, Serial No. 724,127
2 Claims. (Cl. 24—17)



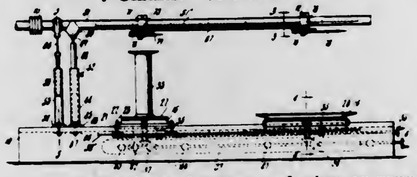
1. A band of flexible material carrying thin flexible rubber coatings comprised of dried and coalesced rubber latex particles only on opposite faces of opposite marginal portions, said coatings presenting exposed rubber surfaces and being firmly cohesive under pressure but practically non-adhesive with the uncoated surface of the band.

2,000,764
COMMUNICATION SYSTEM
Walter S. Lemmon, New York, N. Y., and Clyde J. Fitch, Jersey City, N. J., assignors to International Business Machines Corp., New York, N. Y., a corporation of New York
Application February 10, 1934, Serial No. 710,614
16 Claims. (Cl. 178—4)



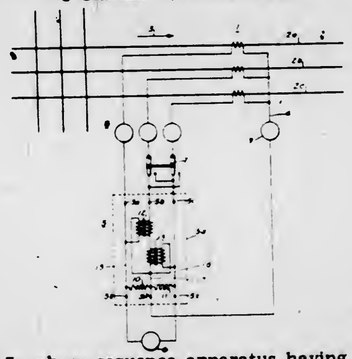
1. In a communication system, capacitive reactance devices corresponding to characters to be transmitted, means to supply current to said

devices, means for initiating transmission of signals corresponding to said characters, and



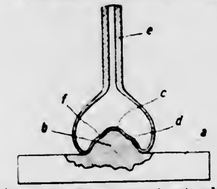
means to effect transmission of initiated character signals upon supplying current to said devices.

2,000,765
COMMUNICATION SYSTEM
Walter S. Lemmon, New York, N. Y., assignor, by mesne assignments, to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application February 15, 1934, Serial No. 711,313
9 Claims. (Cl. 178—53)



1. In a system for conveying intelligence by electrical impulses, in combination, a sender comprising a collector operating at uniform speed and a receiver comprising a distributor adapted to operate at substantially the same speed, said system including means in the sender for transmitting a distributor-operating impulse at a predetermined point in each cycle and signal impulses at other times, means in the receiver responsive to the reception of the operating impulses to rotate the distributor at the same speed as the sending collector, and to adjust it into phase correspondence, and means responsive to phase correspondence for discriminating between the operating and signal impulses.

2,000,766
REPRODUCING APPARATUS
Gene Leofanti, Dongan Hills, N. Y.
Application May 10, 1934, Serial No. 724,959
7 Claims. (Cl. 33—24)

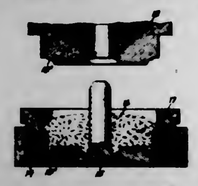


1. Apparatus for enlarging, reducing or reproducing statutary and like form, including a base with a plurality of equi-spaced tracks extending longitudinally along its top, a pair of turntables, slidable on the base along said tracks and operably movable longitudinally and circularly in unison thereon, means in the base in connection with said turntables for operating same, an extensible standard post mounted on a pair of said rails slidable along the longitudinal axis of the base, clamping means for engaging the post to the tracks and the base, a pantograph beam disposed perpendicular to and pivotally mounted on said post, a plurality of horizontally movable, coacting scribing tools in operable connection with the beam and with each other for working on the form and block on the respective turntables, and balancing means in connection with the base and one end portion of the beam for retaining the beam in position during the operating movements of the scribing tools.

2,000,767
PHASE SEQUENCE APPARATUS
William A. Lewis, Jr., Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 28, 1933, Serial No. 704,309
8 Claims. (Cl. 175—294)

1. In phase sequence apparatus having phase conductors comprising a three-phase input circuit and having an output circuit in electrical communication with said input circuit, means for preventing zero sequence currents of said input circuit from traversing said output circuit comprising a pair of current transformers each having a winding connected in series with one of said phase conductors and an additional winding, said additional windings being connected between said one of said phase conductors and the remaining phase conductors of said input circuit.

2,000,768
METHOD OF MAKING CONTACT GLASSES FOR EYES
Rüdolf Lincke, Jena, Germany, assignor to the firm Carl Zeiss, Jena, Germany
Application June 29, 1934, Serial No. 733,149
In Germany July 6, 1933
1 Claim. (Cl. 49—79)



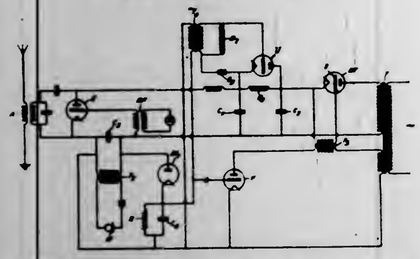
A method of making contact glasses for eyes, consisting in blowing a bulb of plastic glass, then

blowing this plastic bulb against a convex form, so as to give part of the bulb the shape of a shell and to make the final interior surface of this shell correspond to the interior surface of a contact glass, then allowing the blown bulb to become solid and separating the shell from the bulb, and finally so grinding and polishing the exterior surface of the separated shell as to give the central part of the shell the effect of a lens and to provide the peripheral part of the shell with a smooth edge.

2,000,769
NONMETALLIC GEAR WHEELS

Clarence W. Mansur, Malden, Mass., assignor to General Electric Company, a corporation of New York

Application August 17, 1932, Serial No. 629,149
12 Claims. (Cl. 154—2)



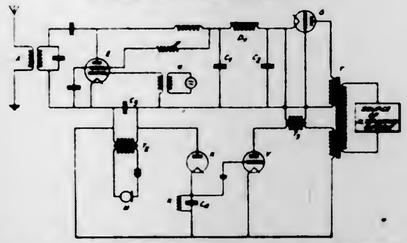
1. A gear wheel or gear wheel blank having a rim comprising a strip of woven cloth wound edgewise on itself and united by an adhesive, the inner edge of the strip having spaced projections, and a web comprising non-metallic material united by an adhesive, material of the web being located in the spaces among said projections for uniting the rim to the web.

4. The method of manufacturing a non-metallic gear wheel or gear wheel blank which comprises winding edgewise a strip of woven cloth having projections along one edge to form a ring with the projections on the inside, and molding a central portion of non-metallic material within the ring and around said projections on the ring.

2,000,770
MODULATION

Emil Mayer, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application June 28, 1933, Serial No. 677,978
In Germany June 17, 1932
13 Claims. (Cl. 179—171)

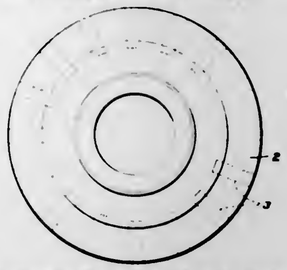


1. Signalling means comprising, a source of high frequency oscillations, a thermionic repeater tube coupled by a circuit with said source, a source of modulating pontentials connected with said circuit between said source of high frequency oscillations and said repeater, a source of alternating current, a thermionic rectifier having its input electrodes connected with said source of alternating current, a filter circuit including an impedance connecting the output electrodes of said rectifier to the electrodes in said thermionic repeater, and a coupling including a second rectifier between said source of modulating potentials and a control electrode in said first named rectifier.

2,000,771
MODULATION

Otto Böhm, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application October 27, 1933, Serial No. 695,396
In Germany October 12, 1932
1 Claim. (Cl. 179—171)

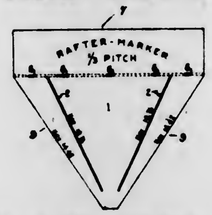


In a telephony signalling system, a thermionic tube having anode electrode, control grid electrode, screen-like electrode and cathode electrode, said tube when energized having a low amplification factor reciprocal, a source of high frequency oscillations connected with the control grid electrode of said tube, a source of modulating potentials connected with the control grid of said tube, and means for maintaining a desired relation between the amplitude of the high frequency waves and of the modulating potentials to control the degree of modulation including a rectifier of the controllable type connected at its input to a source of alternating current and at its output to the anode and screen-like and cathode electrodes of said tube to energize the same and a circuit energized by modulating potentials connected with said rectifier for controlling the rectifying action thereof.

2,000,772
GRINDSTONE

William H. McGill, Winchester, Mass.

Application September 24, 1934, Serial No. 745,185
7 Claims. (Cl. 51—206)

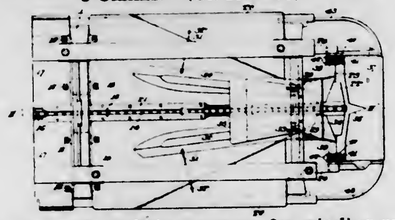


1. A grinding wheel of natural stone having inserts of a different abrasive material secured therein, the surfaces of said inserts being exposed at the grinding face of the stone.

2,000,773
CARPENTER'S TOOL

John R. McGlauflin, Denver, Colo.

Application November 10, 1933, Serial No. 697,438
4 Claims. (Cl. 33—112)

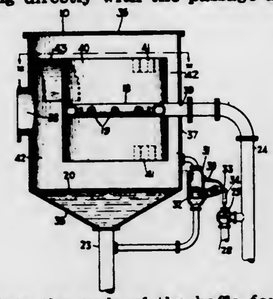


1. A rafter marker comprising: a face plate; a squaring plate projecting perpendicularly from said face plate; a pair of diagonal edges formed in said squaring plate and inclined toward each other, each of said edges forming an angle with said face plate equal to the bevel cut on a rafter of a certain given pitch; and a second pair of diagonal edges formed in said squaring plate, each of said second pair of edges forming an angle with the face plate equal to the bevel cut on hip and valley rafters of the same specific pitch.

2,000,774
BOBBIN CONVEYER FOR WINDING MACHINES

John O. McKean, Westfield, Mass., assignor to Foster Machine Company, Westfield, Mass., a corporation of Massachusetts

Application March 22, 1933, Serial No. 662,012
5 Claims. (Cl. 198—73)



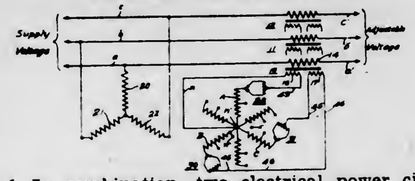
1. An empty bobbin conveyor for winding machines, means for actuating said conveyer and means for delivering the bobbins from said conveyer, comprising a bobbin slide pivoted at its delivery end, a counterbalance, a pulley, and a flexible member passing over said pulley connecting said counterbalance with said bobbin slide.

2,000,775
REFRIGERATION APPARATUS

John W. McNulty, Ridley Park, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application November 4, 1932, Serial No. 641,296
12 Claims. (Cl. 62—152)

1. In refrigerating apparatus, the combination of a spray tank comprising end walls and a tubular wall joining the end walls; a sleeve-like baffle element arranged within the tank with the axis thereof disposed substantially parallel to the axis of the tubular wall; the baffle element being spaced from the tubular wall of the tank to provide a continuous passage therebetween, and the ends of the baffle being spaced from the end walls of the tank to provide communication between the interior of the baffle and the passage; means disposed within the baffle for spraying liquid refrigerant into the tank; means communicating directly with the passage at a point



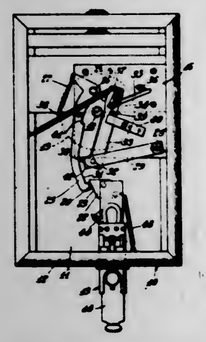
intermediate the ends of the baffle for effecting a vacuous condition inside of the tank; and means for withdrawing cooled liquid from the tank.

2,000,776
REGULATING SYSTEM

James T. Mercereau, Sharon, and Albert J. Maslin, Sharpsville, Pa., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 19, 1932, Serial No. 638,584
6 Claims. (Cl. 172—238)

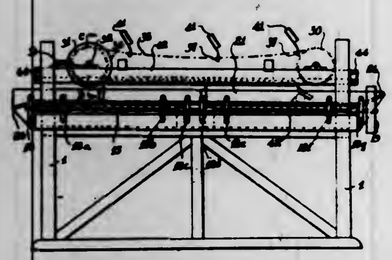
1. In combination, two electrical power circuits, a series transformer, comprising two primary windings and a secondary winding, joining together conductively, through its secondary winding, each conductor of one power circuit with the corresponding conductor of the other power circuit, two sources of voltage for respectively energizing said two primary windings of each transformer, the voltage of the first source being substantially in phase with the power voltage acting on the given conductor and the voltage of the second source having a substantial out-of-phase relation thereto, means for independently adjusting the magnitude of each of said voltages, and means for preventing the primary windings of said transformers from being open circuited when the said two energizing voltages for each transformer are simultaneously adjusted within the regions of zero magnitude.



2,000,777
FILTERING PRODUCT AND PROCESS OF MAKING THE SAME

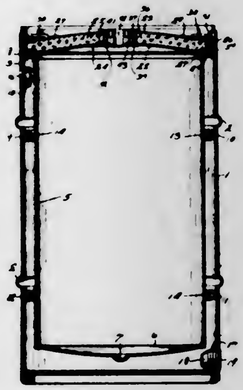
Corwin R. Minton, Los Angeles, Calif., assignor of one-third to William B. Phillips and one-third to Burdick R. Ellis, both of Los Angeles, Calif.

No Drawing. Application April 18, 1933, Serial No. 666,734
5 Claims. (Cl. 210—205)



4. A porous ceramic filtering body, comprising; siliceous particles of a splintery and feathery nature; and a vitreous ceramic bonding material.

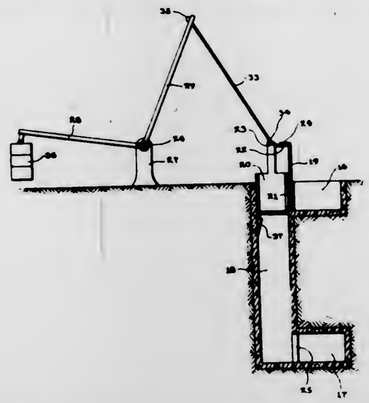
2,000,778
GAME APPARATUS
John F. Meyer, Chicago, Ill.
Application November 24, 1933, Serial No. 699,492
7 Claims. (Cl. 273—142)



1. A game apparatus, comprising the combination of: a cabinet having a substantially horizontal transparent top; a rotatable gear member arranged in the cabinet; a disc carried by said gear member, so as to be rotatable therewith, between said gear member and said transparent top; a coin control device arranged at a point on the cabinet and including a coin slide; means operatively interconnecting said coin slide and said gear member for converting sliding movement of said coin slide into rotating, spinning movement of said gear member and disc; a latching mechanism associated with said means and coin slide; said latching mechanism being rendered effective by movement of said coin slide into coin-releasing position and being released by the return movement of said coin slide into idle position so as to delay rotation of said gear member and disc until the coin slide has completed its movement into coin-releasing position and is returning to idle position; and means cooperating with said disc to provide a pocket in said cabinet between the said top thereof and said disc for the reception of a ball or the like.

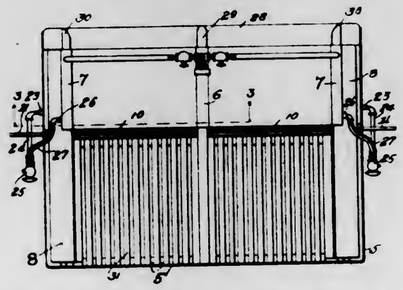
2,000,779
MACHINE FOR BRUSHING CITRUS OR OTHER FRUITS
Trevlyn Whittal Miller, Malvern, Kemgha, Union of South Africa
Application May 11, 1933, Serial No. 670,668
In Union of South Africa July 14, 1932
4 Claims. (Cl. 146—202)

1. An apparatus for treating fruit comprising a frame, means for feeding fruit through said apparatus, a set of spaced upwardly directed brushes arranged at right angles to the direction of movement of said fruit and supporting said fruit in its travel through the apparatus, means for reciprocating said set of brushes, a second set of upwardly directed brushes located between the brushes of said first set, means for reciprocating said second set of brushes oppositely to said first set, endless means located directly above said sets of reciprocating brushes, flexible tongues attached to said endless means and brushes carried by said tongues to brush or wipe the fruit upon said sets of reciprocating brushes and to assist in propelling the fruit through the apparatus and to increase the effectiveness of the cleaning operation.



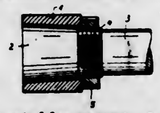
2,000,780
METALLIC CONTAINER
Walter R. Miller, Mansfield, Ohio
Application September 7, 1933, Serial No. 688,508
3 Claims. (Cl. 220—13)

3. A container, comprising inner and outer shells each having an open end, means securing the inner shell at its open end to the outer shell at a point inwardly of the open end thereof, a cover supported by said means for closing the open end of the inner shell and completely disposed within the open end of the outer shell, an annulus surrounding the inner shell and abutting the inner wall of the outer shell, said annulus being formed to provide a channel in its inner face, and an annulus of insulation disposed in said channel and contacting with the inner shell to maintain the latter in spaced relation with the outer shell.



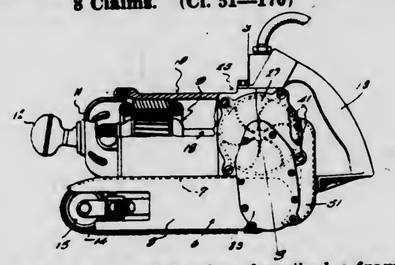
2,000,781
WATER MOTOR
George McF. Mood, Charleston, S. C.
Application April 7, 1932, Serial No. 603,848
8 Claims. (Cl. 253—19)

1. Apparatus of the character described, comprising a sluice-way consisting of an upper supply duct and a lower waste duct communicating through hollow shaft passages, buckets mounted for reciprocation in said shaft passages and arranged to receive water from the supply duct, said buckets descending in the shaft passages, due to the weight of the water received and acting to dump said water into the waste duct, means for raising each bucket independently of the other buckets after said bucket has dumped its contents into the waste duct, and



means for utilizing movements of each bucket for generating power.

2,000,782
STEAM WRAPPING SEALER
Joseph W. Moore, Bristol, Va.
Application August 14, 1933, Serial No. 685,141
Renewed March 2, 1935
1 Claim. (Cl. 93—2)

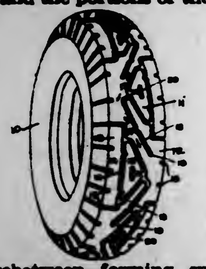


In an apparatus of the class described, the combination of an angle iron frame, a flat hollow heating unit and a slatted platform within and supported by said frame, said heating unit provided with an upstanding hollow central heating unit, plates near the ends of said first mentioned heating unit, said plates extending across said first mentioned heating unit and said platform, said plates provided only above said first mentioned heating unit with upstanding end heating units, each plate provided with a pair of depending threaded extensions between said first mentioned heating unit and said platform, said first mentioned heating unit provided with a pair of lugs contiguous to said platform, threaded rotatable shafts extending through said frame and depending threaded extensions and journalled at their inner ends in said pair of lugs, a wood guard between portions of said frame and against the outer edge of said first mentioned heating unit, wood guards at the outer ends of said central and end heating units, said central and end heating units provided with inlets, and valved tubing connected to said inlets, substantially as shown and described.

2,000,783
ADJUSTABLE GAUGE
Otto Max Müller, Berlin-Lichterfelde, Germany
Application November 27, 1933, Serial No. 700,010
In Germany November 17, 1930
11 Claims. (Cl. 33—178)

1. In an adjustable gauge, a continuous annular gauging member having a gauging face and a seating face, an adjusting member having a seating face adapted to engage the seating face of said gauging member so as to vary the diameter of said gauging member at its gauging face by relative displacement of said two members, the length of said seating faces being equal to the length of one of said members; and means for effecting relative displacement of said gauging and said adjusting member.

2,000,784
PORTABLE SANDERPLANE
Harry L. Myers, Toledo, Ohio, assignor to The American Floor Surfacing Machine Company, Toledo, Ohio
Application October 2, 1934, Serial No. 746,612
8 Claims. (Cl. 51—170)



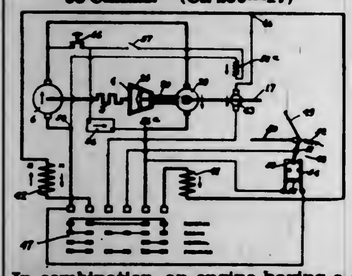
1. In a structure of the class described, a frame, sanding means on said frame, an electric motor supported on the frame, said motor including a shaft and a casing therefor having an apertured cap at one end, a power take-off shaft mounted for rotation on the other end of said frame located at right angles to the motor shaft, an operating connection between said shafts, a ventilating fan housing on said frame located at the last named end of said motor casing, said power take-off shaft extending through said fan housing, and a rotary fan also mounted on said last named shaft.

2,000,785
VEHICLE TIRE
Arthur H. Nellen and Frederick Leopold, Jr., Harmonville, Pa., assignors to Lee Rubber & Tire Corporation, Conshohocken, Pa., a corporation of New York
Application July 14, 1934, Serial No. 735,122
1 Claim. (Cl. 152—14)

In a vehicle tire, in combination, an inner main body, an outer tread body of rubber having substantially circumferentially continuous opposed tread edges or shoulders, and traction-affording bars provided in said tread body for interconnecting the said opposed tread edges or shoulders at circumferentially spaced intervals, said bars being each of a depth sufficient to dispose their road-engaging surfaces substantially in the plane

of the road-engaging surfaces of said tread edges, adjacent bars and the portions of the tread edges

included therebetween forming spaces within which are provided anti-skid formations.



2,000,786

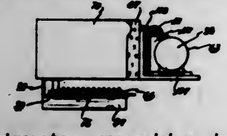
ELECTRIC SYSTEM AND CONTROL FOR MOTOR VEHICLES AND OTHER PURPOSES

Alfred H. Neuland, Irvington, N. J., assignor to Electrogear Corporation, a corporation of Delaware

Application January 12, 1931, Serial No. 508,094

63 Claims. (Cl. 290—17)

61. In combination, an engine having a throttle mechanism and a shaft, a load shaft, two electrically interconnected dynamos for transmitting power between the shafts, and means operated by movement of the throttle mechanism for establishing unidirectional flow of power from the engine shaft to the load shaft when the throttle mechanism is in one position and for establishing unidirectional flow of power from the load shaft to the engine shaft when the throttle mechanism is in another position.



2,000,787

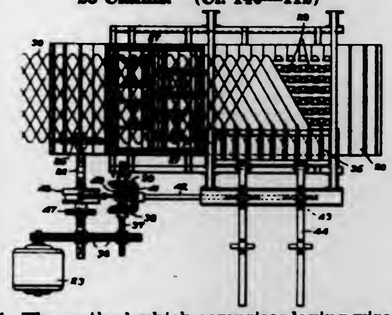
REFRIGERATING APPARATUS

Lawrence A. Philipp, Detroit, Mich., assignor to Kelvinator Corporation, Detroit, Mich., a corporation of Michigan

Application June 20, 1932, Serial No. 618,126

12 Claims. (Cl. 62—116)

12. A refrigerator comprising in combination, an insulated cabinet having a plurality of compartments separated from one another to prevent the free flow of air therebetween, said cabinet having an opening, a single door for closing said opening, a unitary refrigerating apparatus including two evaporators, one for each compartment, said unitary apparatus also including a condensing element connected with the evaporators, said apparatus being removable and insertible as a unit through said opening.



2,000,788

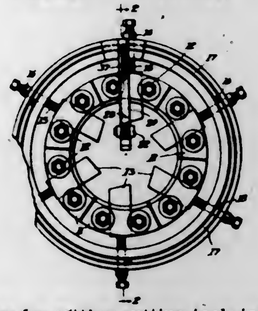
METHOD OF MAKING WIRE FABRIC

William Edgar Reed, Pittsburgh, Pa.

Application April 12, 1923, Serial No. 665,710

25 Claims. (Cl. 140—112)

1. The method which comprises laying wires by a reciprocatory movement in a given plane, bending said wires around supports at the ends of the paths of travel in directions parallel to said plane, and uniting the wires thus laid to form a fabric.



2,000,789

TOOL SETTING GAUGE

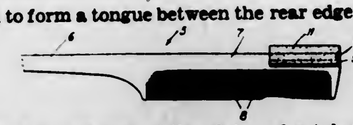
Charles C. Reis, Duluth, Minn., assignor to American Steel & Wire Company, Chicago, Ill., a corporation of New Jersey

Application September 16, 1931, Serial No. 563,157

4 Claims. (Cl. 33—185)

1. A gauge for setting cutting tools including in combination with a tool carrying ring having a number of cutting tools positioned radially thereon, of an arm for attachment to the ring to one side of the same, means on the arm for cooperation with complementary means on the ring for attaching the arm to the ring, whereby said arm when in secured position on the ring is substantially parallel with a cutting tool, a block carrying means for adjustably securing the same to the arm, an indicating member pivotally secured to the block, and means forming part of said indicating member for contact with the cutting tool associated with the arm.

2,000,790



DYE SWAB AND COMB COMBINATION

Lee B. Rever, New York, N. Y., assignor to Rapidol Distributing Corp., New York, N. Y., a corporation of New Jersey

Application February 19, 1934, Serial No. 712,022

1 Claim. (Cl. 132—12)

In combination, a comb including a back, a series of teeth extending from said back, the latter having a slot extending longitudinally from one end to form a tongue between the rear edge of said

back and one side of the slot, and a tubular dye swab around said tongue.

2,000,791

BATHTUB AND SHOWER CONTROL VALVE

Victor E. Schmiedeknecht, Louisville, Ky.

Application November 23, 1934, Serial No. 754,506

9 Claims. (Cl. 277—13)

1. In a bath apparatus including a tub faucet and a shower head, a valve casing having an inlet and an outlet communicating with said faucet and a second outlet communicating with said shower head, said valve casing having an outlet passage in said casing opening directly from the second outlet to the first outlet, and a single valve means in said casing movable between a position to place said inlet into communication with the outlet to said faucet and a position to place said inlet in communication with said shower head, said valve means being arranged to open said passage when in the first position and to close the same when in the second position.

2,000,792

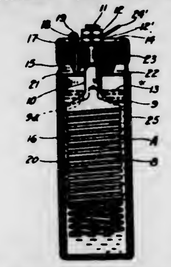
SPRINKLER HEAD FOR SHOWER BATHS

Victor E. Schmiedeknecht, Louisville, Ky.

Application November 23, 1934, Serial No. 754,507

9 Claims. (Cl. 299—144)

1. A sprinkler head for shower baths including a hollow main member having at its lower end a pair of opposed valve seats, a valve member mounted in said hollow member for vertical movement therein and having a peripheral groove at its lower end, the upper and lower faces of said groove being shaped to seat respectively on said valve seats, the lower of said seats being provided with a series of notches, and means to actuate said valve.



2,000,793

SEALING MEANS FOR ELECTROLYTIC DEVICES

Frank Desmond Sprague and Frederick W. McNamara, North Adams, Mass., assignors to Sprague Specialties Co., Quincy, Mass., a corporation of Massachusetts

Application November 10, 1930, Serial No. 494,764

6 Claims. (Cl. 175—315)

1. An electrolytic condenser comprising a cover of insulating material and an electrode provided with a stem projecting through the cover, a recess in said cover, an annular gasket and a flexible annular metal washer, both surrounding said stem and disposed in said recess, and means to fasten the stem to the cover, said fastening means also causing compression of the gasket to insure a liquid and air-tight seal between the stem and the cover.

2,000,794

PROCESS FOR PRODUCING FAST TINTS ON ANIMAL FIBERS

Fritz Straub, Basel, and Hermann Schneider, Riehen, near Basel, Switzerland, assignors to "Society of Chemical Industry in Basle," Basel, Switzerland

No Drawing. Application July 17, 1933, Serial No. 680,896. In Switzerland August 19, 1932

13 Claims. (Cl. 8—5)

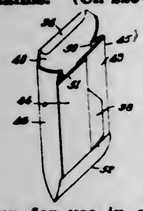
1. Process for producing fast tints on animal fibers, consisting in using for the dyeing, on the one part, chromium compounds of azo-dyestuffs of the general formula R—N=N—R_1 wherein R stands for an aromatic radical containing a group capable of being chromed, and R_1 for the radical of a coupling component, and on the other part, dye-baths which, beside inorganic acids, contain aromatic acids.

2,000,795

CLOSURE

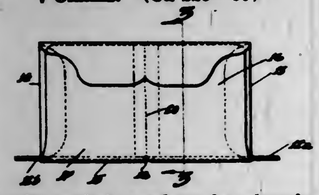
Frank E. Sweeney, Roselle, N. J., assignor to Sweeney-Block & Co., Inc., New York, N. Y., a corporation of New York

Application November 10, 1934, Serial No. 752,539



4 Claims. (Cl. 24—205)

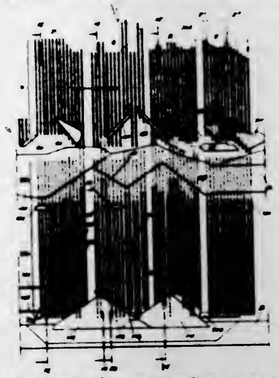
1. In a closure for disengageably connecting or drawing together two edges of a commodity made of relatively thin material, an edge construction



comprising a single ply of material folded upon itself to form several superimposed adjacent upper and lower double layers, of which layers the upper double layer is provided at its free edge with a reinforcement, while the lowermost double layer forms a free edge, adapted to serve as attaching means for a slide fastener and a slide fastener secured to said lowermost double layer.

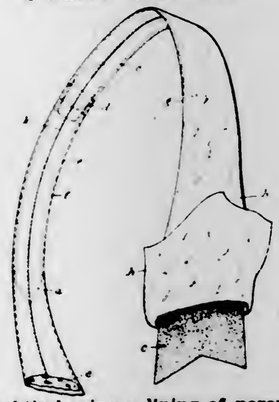
2,000,796
PAPER DRINKING CUP
Willard E. Swift and Francis P. Swallow, Worcester, Mass., assignors to United States Envelope Company, Springfield, Mass., a corporation of Maine
Application July 20, 1931, Serial No. 551,932
4 Claims. (Cl. 229—53)

1. A paper cup for use in a dispensing container, the latter having a dispensing opening with supporting lips on opposite sides thereof, said cup having side and end walls, said end walls having reentrant creases to provide for collapse of said cup to a flat condition, one of said side walls being substantially wider than the other of said side walls, the wider wall being somewhat wider and the narrower wall being somewhat less wide than the spacing between the supporting lips of the container to provide for passage of the narrower wall between said lips and to prevent accidental passage of the wider wall therebetween.



2,000,797
CHURCH COLLECTION ENVELOPE AND METHOD OF MAKING THE SAME
Willard Everett Swift, Jr., Worcester, Mass., assignor to United States Envelope Company, Springfield, Mass., a corporation of Maine
Application October 21, 1932, Serial No. 638,928
7 Claims. (Cl. 229—69)

1. A multi-pocket envelope for church collections and the like, having a rip string contained within and projecting beyond the two ends of one of the envelope's marginal folds which is common to its several pockets, said string being severed at a point between adjacent pockets.

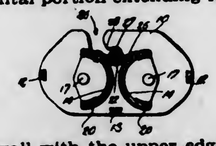


2,000,798
CIRCULAR KNITTING MACHINE
Harry Swinglehurst, Jr., Floral Park, N. Y., assignor to Scott & Williams, Incorporated, New York, N. Y., a corporation of Massachusetts
Application March 25, 1933, Serial No. 662,733
18 Claims. (Cl. 66—50)

1. In a circular knitting machine having independent needles and pattern jacks for same, means for feeding wrap, body and plating yarns at separate points, in combination with means for selecting jacks and needles vertically for wrapping and then lowering same, and cam means

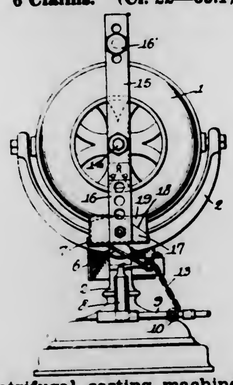
located adjacent the wrapping means adapted to select and raise jacks and needles from both wrap and non-wrap jacks and needles to take the plating yarn as well as the main yarn.

2,000,799
NECKTIE
Franz Heinz Tesch and Elisabeth Tesch, Hanover, Germany
Application June 9, 1933, Serial No. 675,080
In Germany December 21, 1932
6 Claims. (Cl. 2—146)



1. A necktie having a lining of porous rubber having a rough exterior surface and positioned at least in the knot-forming portion of the tie.

2,000,800
RAZOR BLADE SHARPENER
Michael Tollins, Dorchester, Mass.
Application May 1, 1933, Serial No. 668,841
1 Claim. (Cl. 51—80)

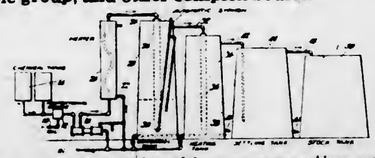


In a safety razor blade sharpener, a frame comprising side walls and connecting bars, a pair of cooperating semi-circular sharpening cylinders journalled in the walls and a razor blade holder removably supported in the walls to present the cutting edges of a blade to the action of the convex sides of the sharpening cylinders and capable of rotation while in the frame when the open sides

of the cylinders are directed toward the holder to present the opposite sides of the cutting edges to the action of the sharpening cylinders, one of the walls having a bearing opening therein for the blade holder and the other wall having an angular slot forming a bearing for the other end of the holder, the angular slot including a vertical portion opening at the upper edge of the side wall and a horizontal portion extending longitudinally

of the side wall with the upper edge of the wall forming the horizontal slot having an indenture therein providing a depending part overhanging at the entrance to the horizontal slot to prevent accidental disengagement of the holder from the frame, each grinding cylinder having an end wall and bearing pin journalled in the side walls and meshing gears respectively carried by corresponding ends of the cylinders.

2,000,801
DENTAL CASTING MACHINE
Chris S. Van Horn, Bloomsburg, Pa.
Application December 15, 1932, Serial No. 647,449
6 Claims. (Cl. 22—65.1)

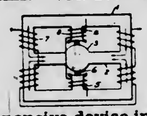


5. A centrifugal casting machine including a support, a member carried by the support for holding a flask, crucible, ingate and mold, said member, when stationary, being in substantially horizontal position, and means for rotating said support to tilt said member automatically into position to maintain the liquid metal under pressure in the ingate and mold along lines substantially parallel with the lines of force incident to the rapid rotation of the support.

2,000,802
BREAKING OF OIL-WATER EMULSIONS
John Charles Walker, Eldorado, Kans., assignor, by mesne assignments, to The Tretolite Company, Webster Groves, Mo., a corporation of Missouri
Application September 2, 1921, Serial No. 498,078
16 Claims. (Cl. 196—4)

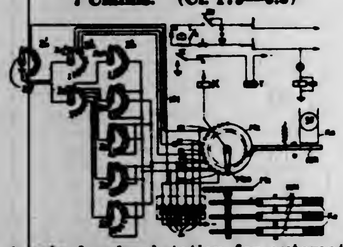
1. A method of breaking emulsions of water-in-oil comprising mixing therewith the mixture of reaction products resulting from the sulfonation of a mixture of substantially equal proportions of commercial benzene and commercial oleic acid.

5. A process for breaking petroleum emulsions, characterized by subjecting the emulsion to the action of a demulsifying agent consisting of a mixture comprising a condensation product of a fatty body and a non-hydroxy-mono-cyclic aromatic group, and other complex bodies.



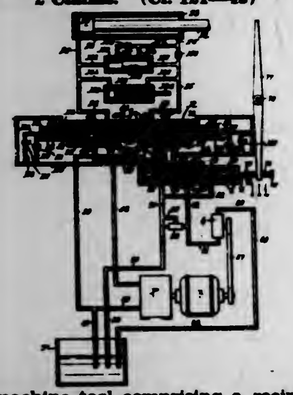
6. A process for breaking or separating petroleum emulsions, characterized by subjecting the emulsion to the action of a treating agent consisting of a mixture comprising a condensation product containing a sulpho-aromatic, soap-forming acid and other complex organic bodies, produced by sulphonating a mass composed of an organic soap-forming acid and an aromatic compound in which the proportion of aromatic molecules to soap-forming molecules is greater than the ratio of one to one.

9. A process for breaking petroleum emulsions, characterized by subjecting the emulsion to the action of a demulsifying agent consisting of a mixture containing a condensation product of an organic detergent-forming group and an aromatic group, and other complex bodies produced by sulfonating a mixture of an organic detergent-forming compound and an aromatic compound.



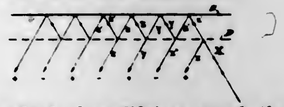
15. A process for breaking or separating petroleum emulsions, characterized by subjecting the emulsion to the action of a treating agent consisting of a mixture comprising a condensation product containing a sulpho-aromatic, soap-forming acid and other complex bodies, produced by subjecting an organic soap-forming acid in which the carboxyl group is blocked and non-reactive, to the action of an aromatic in the presence of a sulphonating agent.

2,000,803
ELECTRORESPONSIVE DEVICE
Albert R. van C. Warrington, Media, Pa., assignor to General Electric Company, a corporation of New York
Application June 11, 1932, Serial No. 616,612
12 Claims. (Cl. 175—294)



1. An electroresponsive device including a magnetic loop locally enlarged, a polar projection extending from said loop toward said enlargement, a movable circuit controlling member including a closed-circuit winding around said enlargement movable in the gap between the pole face and the enlargement, a winding on said loop, a winding on said polar projection, said windings being arranged, when energized, to produce fluxes respectively through and transversely to the closed-circuit winding when this winding is in the neutral position, said closed-circuit winding being normally in a circuit controlling position displaced from its neutral position so as to be threaded by substantially all of one of said fluxes and at least a part of another of said fluxes whereby to provide two cooperating torques respectively dependent on the product of the electric quantities energizing said windings and the square of the quantity energizing one of the windings and to move the closed-circuit winding toward its neutral position when one of said fluxes changes relatively to the other.

2,000,204
COIN FREED SUBSTATION FOR AUTOMATIC TELEPHONE SYSTEMS
Ernst Wehren, Bern, Switzerland
Application December 16, 1932, Serial No. 647,681
In Germany December 18, 1931
7 Claims. (Cl. 179—6.3)



1. A coin freed substation for automatic telephone systems comprising a numeral dial, selectors having contact banks, a coin counting device operated step by step including contacts connected with the contact banks of said selectors which contact banks are at least partly connected in series and adjustable by the numeral dial.

2,000,205
MACHINE TOOL AND HYDRAULIC ACTUATING MECHANISM THEREFOR
Donald H. West, Marlboro, and Kenneth C. Monroe, Hudson, Mass., assignors to The Lapointe Machine Tool Company, Hudson, Mass., a corporation of Maine
Application March 16, 1932, Serial No. 599,188
2 Claims. (Cl. 121—45)

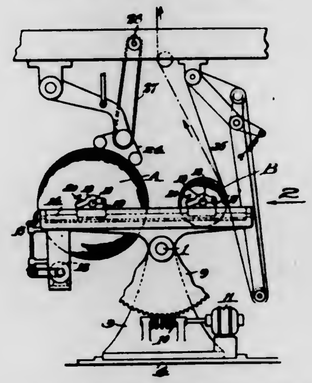
1. A machine tool comprising a reciprocating member, a main cylinder and piston connected to move said member, a source of supply of liquid under pressure, connections from said source of liquid supply to each end of said main cylinder, a reversing valve in said connections, a control valve for said reversing valve, shifting means for said control valve, means associated with said reciprocating member effective to actuate said shifting means as said member approaches each end of its path of travel, and means to cause said reversing valve to move relatively rapidly during the first part of its reversing movement after said control valve is shifted and to move relatively slowly during the latter part of its reversing movement, said reversing valve including a port-closing piston and having a pair of exhaust ports in said connection for the two ends of said cylinder, said ports being axially separated by a distance not less than the axial length of said port-closing piston, whereby one exhaust port will be fully uncovered before said piston begins to cover the second exhaust port and whereby a gradual deceleration of said piston and associated reciprocating member will be effected.

2,000,206
METHOD OF AND APPARATUS FOR SOUND MODIFICATION
Richard M. White, East Cleveland, Ohio, assignor to Macoustic Engineering Company, Cleveland, Ohio, a corporation of Ohio
Application May 18, 1932, Serial No. 612,031
Renewed September 11, 1934
12 Claims. (Cl. 181—30)

1. In a method of modifying sound, the steps which consist in interposing in the path of a sound wave means capable of partially reflecting and partially transmitting therethrough portions of said wave, and then reflecting the transmitted portions of such wave in a phase relationship different to that of the portion initially reflected.

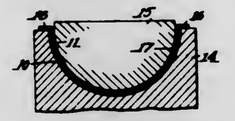
2,000,207
READILY WATER SOLUBLE DRY ALGINATE
Rudolph J. Wig, Los Angeles, Calif., assignor to Kelco Company, Los Angeles, Calif., a corporation of Delaware
No Drawing. Application July 7, 1933, Serial No. 679,452
14 Claims. (Cl. 252—1)

1. The herein described process of manufacturing a dry readily water soluble alginate; consisting in first mixing moist alginic acid, a carbonate and a soluble sugar, and then drying the mixture.



10. A dry, readily water soluble sodium alginate produced by mixing moist sodium alginate and sugar, and then drying the mixture.

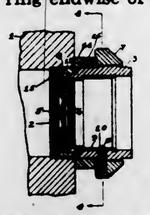
2,000,208
TOY
Frederick V. Williams, Olathe, Kans.
Application July 20, 1934, Serial No. 736,256
2 Claims. (Cl. 46—37)



1. A toy, including a plurality of straight sections having a track formation in the top, a plurality of curved sections having track formations in the top, means for disengageably connecting a plurality of straight sections together, means for disengageably connecting the curved sections to one or two of the straight sections, and cupped members disengageably connected to the ends of a group of the connected sections.

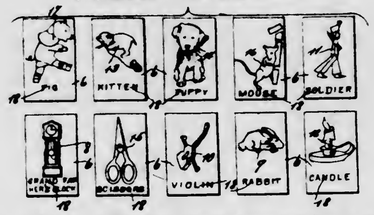
2,000,209
ROLL HANDLING MECHANISM
Henry A. Wise Wood, New York, N. Y., assignor to Wood Newspaper Machinery Corporation, New York, N. Y., a corporation of Virginia
Application September 30, 1930, Serial No. 485,425
Renewed February 7, 1934
10 Claims. (Cl. 242—58)

10. In a device for handling web rolls, the combination of a movable support, bearings laterally movable on said support for a fresh roll of paper, a normally inactive means adapted to drive said fresh roll to rotate the same and bring it up to web speed, and means for moving the support to effect contact of said fresh roll with a traveling web from an expiring roll carried by said support.



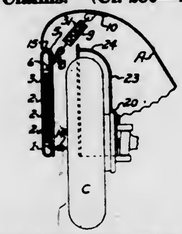
2,000,210
METHOD OF PREPARING ELECTROTYPE PLATES
Henry A. Wise Wood, New York, N. Y., assignor to Wood Newspaper Machinery Corporation, New York, N. Y., a corporation of Virginia
Application June 16, 1932, Serial No. 617,532
4 Claims. (Cl. 29—148)

2. The method of preparing an electrotype plate which consists in forming a thin layer by electrodeposition, casting a thin metal back thereon, bending the plate to the desired shape, casting a thick back on the previously cast back, and shaving the interior of the plate to fit it for the printing cylinder.



2,000,211
ADJUSTABLE LENS MOUNT
Andrew Wollensak, Rochester, N. Y., assignor to Wollensak Optical Company, Rochester, N. Y., a corporation of New York
Application December 11, 1933, Serial No. 701,831
5 Claims. (Cl. 95—64)

1. The combination with a support having a threaded opening, of a barrel, an attaching ring rotatably mounted on the barrel and having a threaded portion engageable with said threaded opening in the support, means for preventing movement of the ring endwise of the barrel, and

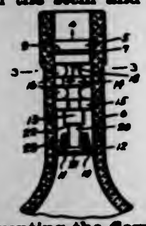


means for adjustably locking the barrel against rotative movement relatively to said ring.

2,000,812
PLAYING CARDS
Richard E. Adams, Moorestown, N. J.
Application June 12, 1934, Serial No. 730,317
2 Claims. (Cl. 273—152)

1. A deck of playing cards comprising a group of cards having indicia of different tangible elements and additionally a second group of cards each bearing a letter of the alphabet, the cards of the last named group being present in the group in frequency approximating the frequency in their appearance in aggregate letters necessary to formation of the words commonly employed in denomination of the aggregate of said tangible elements.

2,000,813
ACTUATED FENDER SHIELD
James Anchor, Detroit, Mich.
Application March 17, 1934, Serial No. 716,089
13 Claims. (Cl. 280—153)

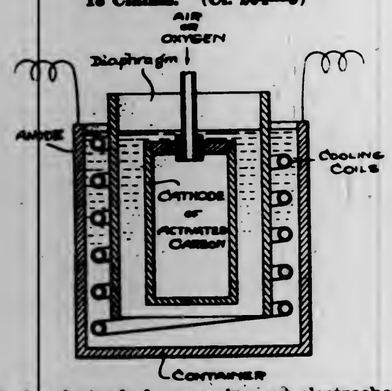


1. In combination with a vehicle front fender, wheel and wheel mounting, a shield releasably attached to the fender, and an actuator member secured to the wheel mounting and adapted to contact said shield during turning of the wheel whereby the shield is displaced from its normal operative position.

2,000,814
NONREFILLABLE BOTTLE
Fabian K. Anderson, Buffalo, N. Y., assignor of thirty-three and one-third per cent to James Quinn and thirty-three and one-third per cent to Edward Regan, Buffalo, N. Y.
Application October 30, 1934, Serial No. 750,732
2 Claims. (Cl. 215—20)

1. A non-refillable bottle comprising a neck, a valve seat in said neck, a stopper mounted in

the neck having fluid passages therein, a stem depending from said stopper, a head on the lower end of said stem flush with the valve seat, and a valve slidable on the stem and engageable with



the seat for preventing the flow of fluid into the bottle, said valve further being engageable with the head for preventing leakage between the stem and the valve.

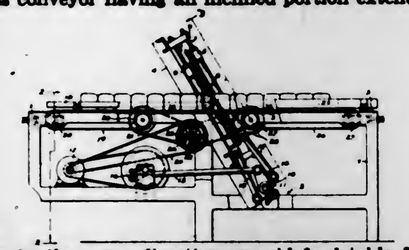
2,000,815

PROCESS FOR CARRYING OUT ELECTRO-CHEMICAL REACTIONS

Ernst Berl, Darmstadt, Germany, assignor to The Mathieson Alkali Works, Inc., a corporation of Virginia

Application September 20, 1931, Serial No. 563,155
In Germany February 3, 1928
18 Claims. (Cl. 204—9)

1. An electrode for carrying out electrochemical reactions containing active carbon and provided with an extremely thin coating of an electrolyte repellant substance covering at least a part of said electrode.



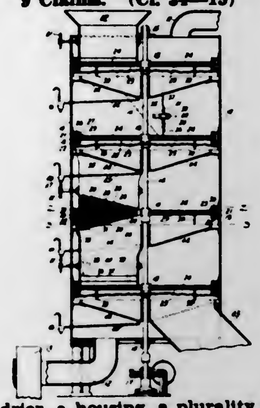
2,000,816

BREAD SLICING MACHINE

William E. Bettendorf and Henry H. York, Bettendorf, Iowa, assignors, by mesne assignments, to The Miller Corporation, Bettendorf, Iowa, a corporation of Delaware

Application November 7, 1931, Serial No. 573,532
6 Claims. (Cl. 146—153)

1. In a bread slicing machine, a plurality of reciprocable slicing blades, a feed table for conducting unsliced bread to said blades, said feed table being inclined with respect to said cutter blades whereby unsliced loaves of bread may move by gravity to said blades, said feeding means and slicing blades being disposed a material distance apart whereby a plurality of loaves of bread may be positioned on said table between said blades and feeding means to absorb the pressure created by said feeding means when said blades are momentarily at rest at the ends of their reciprocations, said feeding means comprising an endless conveyor having an inclined portion extend-



ing in the same direction as said feed table for moving unsliced loaves of bread to said feed table.

2,000,817

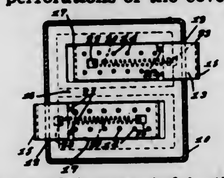
APPARATUS FOR DRYING LOOSE MATERIAL

Kenneth R. Bixby, Geneseo, Ill., assignor to Midland Electric Coal Corporation, Indianapolis, Ind., a corporation of Indiana

Application June 27, 1933, Serial No. 677,877
9 Claims. (Cl. 34—15)

1. In a drier, a housing, a plurality of foraminous material supporting devices movably mounted in said housing at different levels, means for passing a gaseous drying medium through said foraminous supporting devices and the material supported thereon, means for actuating said supporting devices, each supporting device comprising a plurality of sections and each section being movable with relation to the other sections to discharge the material supported thereby, means for controlling the relative movements of said sections and causing the same to be successively actuated to discharge said material at a given point in the travel of said supporting device, and a chute arranged beneath the point of discharge of each supporting device to receive the material therefrom and deliver the same to the next lower supporting device, said chute having its upper edge so arranged about said point of discharge as to prevent the passage of said drying medium between the upper end of said chute and the adjacent supporting device.

2,000,818



COMBINED SALT AND PEPPER SHAKER

Allen H. Bomberger, Ephrata, Pa.

Application July 21, 1934, Serial No. 736,429
1 Claim. (Cl. 65—45)

A salt and pepper shaker comprising a container having compartments, a flanged cover for

said container and provided with groups of perforations with each group aligning with a compartment, said cover having slots in opposite sides of its flanged portion, perforated slides operating through the slots and normally positioned to close the perforations of the cover and adapted to open the perforations of the cover by manual

manipulation, a plate mounted in the cover and having slots opening through opposite edges thereof to slidably receive the slides, a retaining plate engaging the first plate and having slots and underlying the slides with portions of the latter exposed to the compartments by way of the last-named slots, and springs connected to said retaining plate and the slides.

2,000,819

TANK CAR

Conrad C. C. Burkhardt, Philadelphia, Pa.

Application July 26, 1930, Serial No. 470,974
17 Claims. (Cl. 105—360)

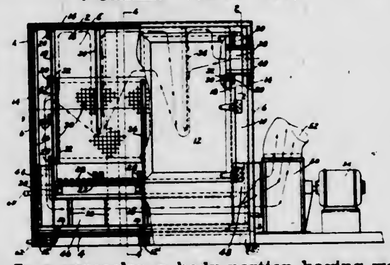
1. The combination in a tank car having upper and lower portions, the lower portion being made as an integral casting and consisting of an outer shell, an inner bottom plate, vertical webs extending the full length of the car and connecting the bottom plate to the shell; said parts forming part of the under frame for the car; end members cast integrally with the lower portion; a central cast metal upper section, connected to the lower portion; and sheet metal upper side sections secured to the sides and ends of the lower portion and to the central upper section.

2,000,820

PROTECTOR MOTION FOR LOOMS

James Chapman, Atlanta, and Benjamin W. Brown, Hapeville, Ga.

Application July 10, 1933, Serial No. 679,764
9 Claims. (Cl. 139—345)



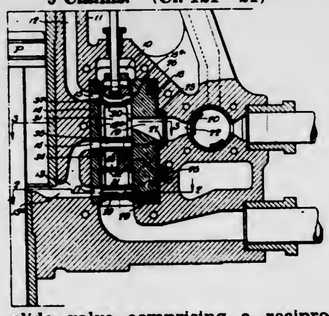
1. In a loom having a lay, a shuttle binder thereon, a shuttle and means for stopping the loom, the combination of a dagger, means for holding the dagger stationary in idle position during the normal operation of the loom, and means controlled by the binder for moving the dagger into operative position for stopping the loom when the shuttle is not properly boxed, said means including a fixed cam on the loom frame, means normally positioned to be engaged by said cam and to be actuated thereby for moving the dagger into operative position as the lay beats up, and means operated by a properly boxed shuttle to disable said dagger-moving means.

2,000,821

MEANS FOR COOLING AND CONDITIONING AIR

Allen W. Clarke and William F. Dietrichson, Berwick, Pa., assignors to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey

Application October 15, 1932, Serial No. 637,906
7 Claims. (Cl. 62—133)



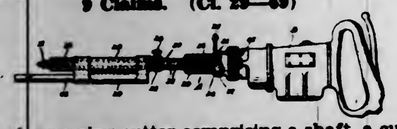
1. In a precooler, a body portion having walls therein forming an ice chamber a reservoir receiving water melting from the ice, baffle means in the ice chamber dividing the latter into a plurality of compartments, air inlet and outlet means for said ice chamber, blower means for drawing air through the ice chamber, means constituting at least part of the walls of said ice chamber so formed as to remove suspended moisture from the air, and an air duct in said reservoir receiving air from the ice chamber and having one end discharging outside the body portion.

2,000,822

SLIDE VALVE

Eugene C. Clarke, Chambersburg, Pa., assignor to Chambersburg Engineering Company, Chambersburg, Pa., a corporation of Pennsylvania

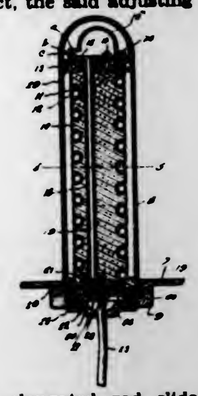
Original application January 30, 1934, Serial No. 709,034. Divided and this application July 5, 1934, Serial No. 733,892
9 Claims. (Cl. 121—21)



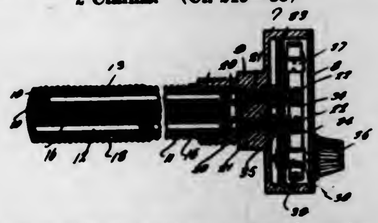
1. A slide valve comprising a reciprocatory valve body having equal fluid pressure distribution areas at its opposite faces, a pair of surfaces through one of which fluid pressure is admitted abutting said faces, said surfaces having equal pressure distribution areas confronting said valve, one of said surfaces comprising a face of a movable plate, means at the outer face of said plate for adjusting said plate toward the other of said surfaces, and means for maintaining a preponderance of fluid pressure against the inner face of said plate.

2,000,823
TURNTABLE
Ralph Clover, North Vernon, Ind.
Application May 2, 1933, Serial No. 668,972
Renewed October 23, 1934
1 Claim. (Cl. 104—45)

In a turntable for a concrete paver or mixer, a panlike base, casters carried at one end of said base and having tensioned connection therewith to normally elevate said base above the contact of the casters with the ground, link connections between the other end of the base and the paver or mixer, lugs on the sides of the base for contact with the link connections, a circular track centrally of the base, a horizontally disposed pulley wheel journaled centrally upon the base and having traction wheels movable upon the circular track, spaced parallel ramps superimposed upon the pulley and fixed thereto, and power cables trained about the pulley and operative for the turning thereof in opposite directions.



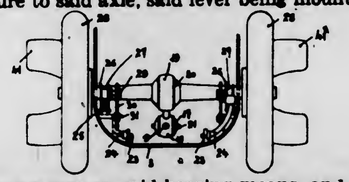
2,000,824
RECESSING CUTTER
William Barnes Crockett, Notre Dame de Grace, Quebec, Canada
Application September 13, 1933, Serial No. 689,334
9 Claims. (Cl. 29—69)



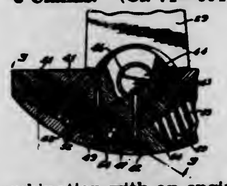
1. A recessing cutter comprising a shaft, a cutter mounted on the shaft, said shaft being mounted in a sleeve bush having an eccentrically cut shaft receiving bore, an outer casing for said sleeve bush having an eccentrically cut bore for receiving said bush, the bore of the sleeve bush and bore of the casing being normally disposed eccentric to one another whereby said shaft is concentric with the outer surface of the casing, a slot in the outer casing, a lever member projecting through said slot and mounted in the sleeve bush whereby on movement of the lever in one direction said sleeve bush is rotated to project the cutter eccentrically of the casing, means mounted on said casing co-operating with the lever and slot for gauging the rotational movement of said sleeve bush, a power unit for operating the cutter and means for uniting the power unit to the casing in operative connection with the shaft.

2,000,825
HEATER
Walter R. Davies, Missoula, Mont.
Application June 12, 1933, Serial No. 675,629
Renewed November 26, 1934
1 Claim. (Cl. 219—38)

An electric heater for liquid tanks comprising a di-electric core, a heat coil wound on the said core, a thermostatic switch secured to one end of the core in electrical connection with the said coil, means at the opposite end of the core for fastening the core to a tank so that the thermostat end will project into the tank, means extending longitudinally through the core for adjusting the said thermostatic switch, said thermostatic switch comprising a bi-metal element provided with a contact and a complementary contact, a strip spring supporting the complementary contact, the said adjusting means consisting of an elongated rod slidably disposed through the core and adapted to engage the strip spring at one end and at its opposite end provided with a threaded head threadedly disposed into the outer end of the core.



2,000,826
ELECTRICAL HEATER
Walter R. Davies, Missoula, Mont.
Application July 21, 1934, Serial No. 736,401
2 Claims. (Cl. 219—38)

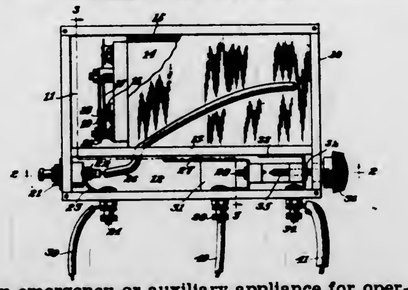


1. In a heating device of the character described comprising a core of insulation provided with external threads, a pair of conductor rods extending longitudinally in the core, one of said rods being provided with an opening at its inner end, for receiving one end of a heating element wound on the core, the other rod being provided with a plurality of openings longitudinally spaced therein, diametrically disposed and longitudinally spaced bores in the core, the openings of the last mentioned rods being registrable with the said diametrical bores, said last mentioned bores being selective to receive the other end of the heating element when the openings of the last mentioned rod are registering therewith, and means at the outer ends of the rods whereby the rods can be fed outwardly to bind the rods to the ends of the heating element.

2,000,827
LAND AND WATER MOTOR VEHICLE
Ulysse Texier de la Caillerie, Secondigny-En-Gatine, France
Application April 20, 1933, Serial No. 667,120
In France April 20, 1932
7 Claims. (Cl. 115—1)

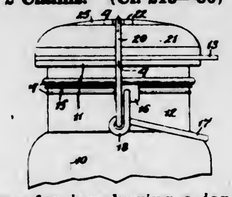
3. In an amphibian vehicle normally running on two wheels, a water-tight body, a load carrying member in said body, a lever pivotally mounted on said body and carrying said load carrying member, a main drive axle resiliently and pivotally mounted on said body, a pair of wheels carried by said main drive axle and provided with water propulsive means, bearing means for applying pressure to said axle, said lever being mounted to apply pressure on said bearing means, and resilient means opposing the relative motion of said body and said axle due to load actuated pressure applied by said lever, whereby changes in load applied to said load carrying member automatically cause changes in the relative position of said body and said axle which increase the stability of said vehicle.

2,000,828
INTERNAL COMBUSTION ENGINE
Herbert C. Edwards, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan
Application September 12, 1932, Serial No. 632,664
3 Claims. (Cl. 74—604)



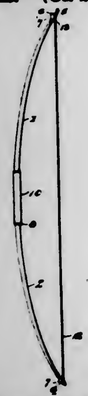
3. The combination with an engine crankshaft having a crank arm, of an integral extension in line with the crank arm, a counterweight having a slot adapted to receive the extension, pivot means for mounting said counterweight on said extension, and means including opposed coil springs acting between and to resist relative movement of the arm and counterweight, the axes of said springs defining an obtuse angle.

2,000,829
LOCK
Morris Falk, Fitchburg, Mass.
Application April 23, 1930, Serial No. 446,698
Renewed March 16, 1934
7 Claims. (Cl. 70—46)



1. In a cylinder lock, the combination with the cylinder, a key operated plug, the plug having an annular groove therearound, and yielding means adapted to enter said groove to hold the plug in after it has once been assembled, of a movable member carried by the plug and adapted to be moved into said groove to push the yielding means back, said movable member being so located that the locking key will not move it into the groove but that it can be so moved to free the plug by introducing a long key in the key slot which will project beyond the position at the extreme end of the locking key when the plug is in unlocked position.

2,000,830
IGNITION TROUBLE ELIMINATOR
Robert Edward Farren, Revere, Mass.
Application August 10, 1931, Serial No. 556,260
1 Claim. (Cl. 123—148)

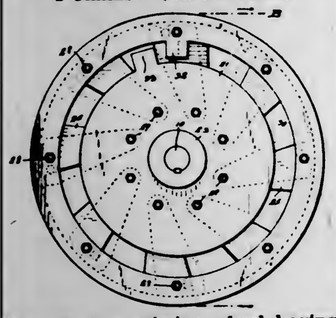


An emergency or auxiliary appliance for operating the ignition system of an internal combustion engine independently of the usual ignition switch, the same comprising a casing, a spark coil of the vibrator type located within the casing and having primary and secondary windings of which one terminal of each is grounded, the other terminal of the primary winding being for connection with the ungrounded terminal of the motor vehicle battery and the other terminal of the secondary winding being for connection with the rotary member of the vehicle distributor, and a spark gap connected across the secondary winding and comprising a U-shaped member of insulating material mounted within the casing, a stationary contact extending through one arm of said U-shaped member, and a screw contact threaded through the other arm of the U-shaped member and having an operating knob located exteriorly of the casing for adjustment of the screw to effect such spacing of the gap as will shunt the secondary current to ground except when the movable member of the distributor head is directly opposite any of the stationary contacts of said head.

2,000,831
CLOSURE FOR FRUIT JARS AND THE LIKE
Ralph S. Fetter, Buffalo, N. Y.
Application September 6, 1933, Serial No. 688,316
2 Claims. (Cl. 215—86)

1. A closure for jars having a jar body and a cover fitted over the mouth of said body, comprising a bail pivoted to said body and arranged to be swung along the upper side of said cover, said cover being provided centrally with an integral elevated portion provided on its upper side with grooves in cruciform arrangement and of different depths and each groove forming a seat for the center of said bail and means for leading the center of said bail up to said elevation comprising at least four ridges in cruciform arrangement and arranged substantially at right angles to said grooves, said ridges radiating from said elevation and being of substantially the same height as said elevation at their inner ends and becoming shallower toward their outer ends, and said ridges also forming reinforcing ridges for said cover.

2,000,833
BOW
Charles R. Fisher, Williamsport, Pa.
Application April 2, 1932, Serial No. 602,813
2 Claims. (Cl. 273—107.5)



1. In a bow, the combination with a tubular handle of D-shape in cross section, of a pair of limbs each having a shank U-shaped in cross section and rigidly retained within said handle.

2,000,833
PROCESS FOR THE PRODUCTION OF ZINC
Max Gerhard Freise, Angermund, near Duesseldorf, Germany, assignor to American Lurgi Corporation, New York, N. Y., a corporation of New York
No Drawing. Application March 29, 1934, Serial No. 718,087. In Germany April 30, 1932
10 Claims. (Cl. 75—28)

1. Process for the recovery of metallic zinc from materials which contain oxidic compounds of zinc, comprising heating the zinc containing material with coal in a rotary furnace by direct contact with fire gases, collecting at least the greater part of the reduced zinc in a metal present in the furnace and removing the collected zinc from the furnace mixed with said metal.

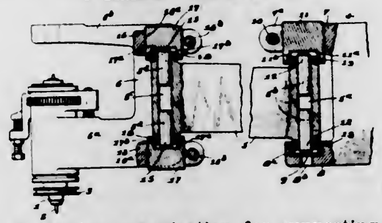
2,000,834
POWER TRANSMISSION WHEEL
Henry H. Frick, Fricks, Pa.
Application June 21, 1930, Serial No. 462,873
4 Claims. (Cl. 74—230.1)

1. A power transmission wheel having a hub, the hub including two spaced plates, a plurality of arms disposed between said plates and having their inner ends pivoted to said plates, the arms extending tangentially with reference to a circle concentric to the hub, a U-shaped rim embracing the ends of the arms, bolts passing through the rim, the ends of the arms being slotted to receive said bolts, the rim having an inwardly projecting lug and one of the plates having an outwardly projecting lug confronting the lug on the rim and limiting the movement of the arms in one direction, the rim acting to limit the movement of the arms in another direction.

2,000,835
ARTIFICIAL SAUSAGE CASING
Franz Goldberger, Breda, Netherlands, assignor, by mesne assignments, to Sylvania Industrial Corporation, Fredericksburg, Va., a corporation of Virginia
Application March 22, 1932, Serial No. 600,551
In Germany October 24, 1929
12 Claims. (Cl. 17—45)

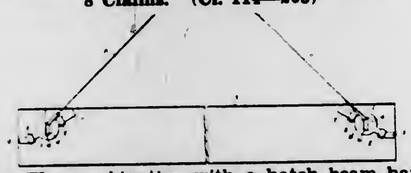
1. As an article of manufacture, artificial skins, casings and envelopes, adapted for encasing sausages and other alimentary products, formed from non-fibrous cellulosic material and having a multiplicity of cavities in the walls of said article, whereby the permeability and elasticity of the walls are increased.

2,000,836
PROCESS OF MANUFACTURING FROM NITROCELLULOSE, SKINS AND ENVELOPES PARTICULARLY ADAPTED FOR USE AS ARTIFICIAL SAUSAGE CASINGS
Franz Goldberger, Breda, Netherlands, assignor, by mesne assignments, to Sylvania Industrial Corporation, Fredericksburg, Va., a corporation of Virginia
No Drawing. Application January 22, 1934, Serial No. 707,864. In Germany September 5, 1931
8 Claims. (Cl. 18—57)



1. The process of manufacturing artificial skins and envelopes particularly adapted for use as artificial sausage casings, which consists in shaping the envelope from cellulose-nitrates and thereupon partially denitrating with sulphohydrates the shaped envelope so that its nitrogen content remains between about 1.5 and 0.5 percent.

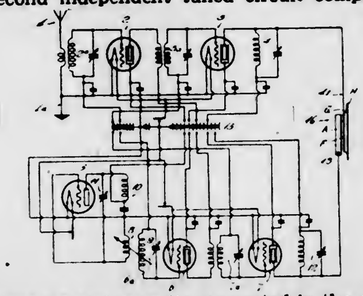
2,000,837
KNITTING MACHINE
William D. German, Philadelphia, Pa., and Charles Moses, New York, N. Y., assignors to H. Brinton Company, Philadelphia, Pa., a corporation of Pennsylvania
Application October 2, 1934, Serial No. 746,566
18 Claims. (Cl. 66—50)



1. In a knitting machine, a stitch cam, an inclined design wheel for elevating needles selectively into position to be depressed by said stitch cam, means on said wheel for raising needles selectively to either of two elevations, and needle depressing means between said wheel and said cam.

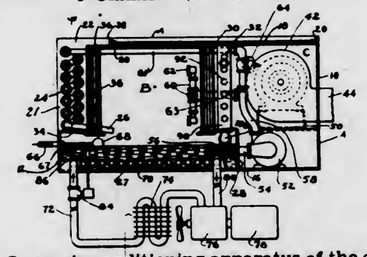
2,000,838
SWINGABLE SUPPORT FOR ENGRAVING MACHINE CUTTER HEADS
George Gerten, Racine, Wis.
Application September 22, 1933, Serial No. 690,612
7 Claims. (Cl. 308—2)

1. A bearing organization for supporting the laterally swingable jointed linkage associated with a machine tool device, including a pivotal joint having a vertical axis, said joint embodying alined vertically spaced upper and lower vertical clamping hubs rigid with one member; vertically elongated alined slide blocks normally rigidly clamped in said hubs, respectively, and adapted for longitudinal sliding adjustment with respect thereto when said hubs are loosened thereon; radial and end thrust rolling bearings in the adjacent ends of said blocks, respectively; and alined vertical studs rigid with another member and fitted and centered in said bearings in said blocks, respectively, whereby when said hubs are loosened, one of said members can be bodily raised or lowered by relative longitudinal sliding movement between said two hubs and said two blocks held by said bearings and studs, and then secured at the adjusted elevation by clamping the blocks to the hubs.



2,000,839
AUTOMATIC HATCH BEAM LOCKING DEVICE
Michael J. Hanlon, Weehawken, N. J., assignor to Black Diamond Steamship Corporation, New York, N. Y., a corporation of Delaware
Application July 3, 1934, Serial No. 733,674
8 Claims. (Cl. 114—203)

1. The combination with a hatch beam having hook receiving openings therein, of automatic locking devices at the ends of the beam covering the openings, said locking devices moved to unlocking position by the action of lifting hooks in the openings engaging the beam.

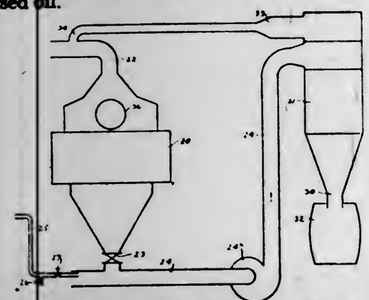


2,000,840
SOUND REPRODUCING SYSTEM
Ernest R. Hentschel, Washington, D. C.; John Olson, administrator of said Ernest R. Hentschel, deceased, assignor to Wired Radio, Inc., New York, N. Y., a corporation of Delaware
Application May 23, 1930, Serial No. 455,132
3 Claims. (Cl. 250—22)

1. In a sound reproducing system an electrostatic sound reproducer comprising a pair of electrodes disposed in parallel relation and movable in respect to each other, a source of received radio frequency oscillations, a local source of radio frequency oscillations, a radio frequency amplifier having its input connected to said source of received oscillations, a tuned circuit comprising an inductance and a capacity connected in the output circuit of said amplifier, a second radio frequency amplifier having its input connected to said local source of radio frequency oscillations, a second independent tuned circuit comprising

inductance and capacity connected in the output circuit of said second amplifier, and means including connections between the electrodes of said sound reproducer and suitable points in each of said tuned circuits for applying to each of said electrodes individually an oscillating potential of the particular frequency produced in the tuned circuit to which it is connected, whereby a beat frequency electrostatic reaction between said electrodes is obtained.

2,000,841
APPARATUS FOR CONDITIONING AIR
Wallace H. Herdlein, St. Louis, Mo., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application June 20, 1933, Serial No. 676,701
9 Claims. (Cl. 257—7)



8. In an air conditioning apparatus of the character described, in combination, a combined spray chamber and water reservoir in direct communication, an evaporator unit within said reservoir, spray devices within the chamber, means to circulate water from the reservoir to the spray devices, means associated with the spray devices adapted to prevent excessive pressure on the spray devices to thereby insure their proper functioning, and means to draw air through the spray and over the surface of the water in the reservoir.

2,000,842
PIGMENT
Carroll A. Hochwalt, Dayton, Ohio, assignor to The Mead Research Engineering Company, Dayton, Ohio, a corporation of Ohio
Application January 31, 1931, Serial No. 512,530
8 Claims. (Cl. 134—59)

1. In the manufacture of pigment, the method which comprises mixing ferrous hydroxide with a non-alkaline tannin extract derived from chest-

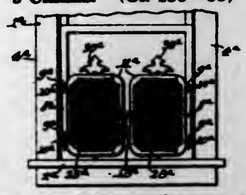
nut wood, and film forming oil to form a non-alkaline mixture, bubbling an oxidising gas such as air through the non-alkaline mixture to produce a copious rapid settling bluish black precipitate in which the oil is entrained and dispersed, and separating, washing and drying the resultant precipitate without substantial vaporization of the oil to provide a water insoluble, fluffy, flocculent, bluish black pigment of fine particle size containing the entrained and dispersed oil.

8. A pigment comprising the water insoluble bluish black solid containing water of crystallization which is the hydrated dried reaction product of oxidation of a non-alkaline mixture of ferrous hydroxide and tannin extract, the pigment being finely divided, flocculent, substantially neutral, having a tinting strength greater than bone black and non-settling properties, and possessing high dielectric strength and showing in a protective coating film voltage puncture limits of over 600 volts per mil.

2,000,843
COMPOSITION FOR KILLING INSECTS AND FUNGI
Paul Janke, Ascona, Switzerland, assignor to Dehne & Co. Orbesa-Gesellschaft, Brissago, Switzerland
No Drawing. Application July 10, 1933, Serial No. 679,790. In Germany July 13, 1932
1 Claim. (Cl. 167—22)

The herein described composition for destroying obnoxious insects and fungi, which consists of a mixture of 33 parts of soft soap, 11 parts of a 2% cresol soap solution, 17 parts of a 10% watery tobacco extract, 22 parts of a ½ normal-potassium permanganate solution, 17 parts of vegetable glue, and from ¼ to 2 parts of alcohol.

2,000,844
LOOSE LEAF BINDER
Stanley G. Johnson, Grosse Pointe, Mich., assignor to The Burkhardt Company, a corporation of Michigan
Application May 9, 1934, Serial No. 724,701
7 Claims. (Cl. 129—13)

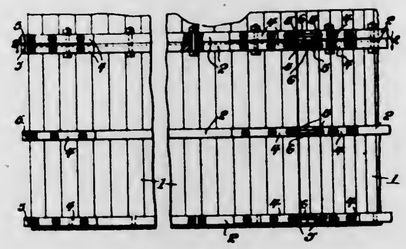


1. A loose leaf binder of the post type comprising opposed leaf-engaging members, means on said leaf-engaging members to cooperate with punched filler sheets, solid grooved posts secured to one of the leaf-engaging members, hollow posts secured to the other leaf-engaging member adapted to telescopingly cooperate with the solid grooved posts, locking means rotatably mounted in the said hollow posts each comprising a rivet having its head concaved substantially the same radius as the center of the hollow post, and means to rotate the said rivet to urge the solid grooved post against the inside of the hollow post and cause the high portions of the grooved rivet head to register with the said solid grooved post.

2,000,845
WINDOW OF METAL OR SIMILAR MATERIAL IN METAL WALL
Gottfried Bruno Jonas and August Thorman Esseling, Eindhoven, Netherlands, assignors to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application February 11, 1931, Serial No. 515,118
In the Netherlands March 25, 1930
3 Claims. (Cl. 250—35)

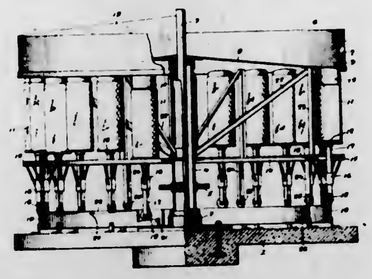
1. A metal wall having an aperture, the wall at the edge of said aperture having a peripheral recess, a thin non-vitreous disc extending into said recess so as to form a window, a fused vitreous binding agent enclosing the peripheral edge of said non-vitreous window, and a metal ring in the recess, said binding agent adhering to the bottom and side walls of said recess and to the metal ring.

2,000,846
CURTAIN PROTECTOR
Agnes Jacison, Chicago, Ill.
Application June 7, 1934, Serial No. 729,473
5 Claims. (Cl. 156—33)



5. A barrier comprising a frame provided in its top and in its bottom with openings, arms within the barrier and extended outwardly beyond one edge of the barrier, the arms having fingers received in the openings, holding devices on the fingers and engaging the frame, and hanger means whereunto the outer ends of the arms are pivoted.

2,000,847
BUILDING PANEL
Arthur L. Kehm, Harrisburg, S. Dak., assignor to Meinzer & Kehm Company, a corporation of South Dakota
Application January 5, 1932, Serial No. 584,289
Renewed December 18, 1934
1 Claim. (Cl. 20—1.4)



A building wall consisting of panels the inner surfaces of which are smooth, ribs applied to the outer surfaces of the panels adjacent the upper and lower edges and having beveled extremities formed at the ends of the panels with the angle

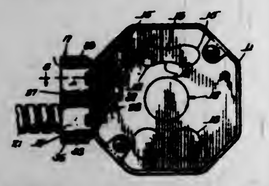
of the bevel so disposed that the ends of the ribs extend beyond the panels, lug plates attached to the ribs adjacent the beveled ends, bolts detachably connecting the lug plates of adjacent panels together, the upper ribs having their top faces disposed above the plane of the upper edges of

the panels and the bottom ribs having their lower faces correspondingly disposed with reference to the lower edges of the panels to effect rib overlap of vertically adjacent panels while bringing the adjacent ribs of the same into face contact, and bolts passing through said adjacent ribs to secure the same together.

2,000,848
COAL BAGGING MACHINE
Benjamin W. Kellett, New Orleans, La.
Application December 27, 1932, Serial No. 649,040
1 Claim. (Cl. 226—55)

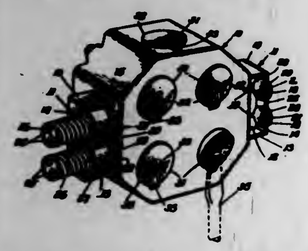
A bagging machine comprising a base, a vertical shaft fixed to said base, a rotatable sleeve mounted on the shaft with the latter projecting above said sleeve, a hopper secured to the sleeve and having the shaft extending therein, discharge necks on said hopper to enter mouths of sacks, a sweep fixed to the shaft and engaging walls of the hopper to direct material into the necks during rotation of the hopper with said sleeve, supporting bars fixed to the sleeve below the hopper and extending radially from said sleeve, spaced annular members connecting said bars, guides carried by the annular members and disposed below and between the latter, stems slidable in the guides and located between the annular members, rollers secured to said stems, plates carried by the stems and engaging the sacks, a notched track carried by the plates and having the rollers riding thereon, legs secured to said bars inwardly of the annular members and the stems, rollers for said legs, and a second track carried by the base inwardly of the first track and engaged by the rollers of said legs.

2,000,849
RHEOSTAT
Edwin W. Kiefaber and Josef Doerr, Philadelphia, Thomas Barclay Whitson, Moylan, and William B. Creagmile, Norwood, Pa., assignors of fifty one-hundredths to James G. Biddle, trading as James G. Biddle Company, Philadelphia, Pa., and fifty one-hundredths to Rubicon Company, Philadelphia, Pa., a corporation of Pennsylvania
Application July 15, 1932, Serial No. 622,738
9 Claims. (Cl. 201—62)



1. In a rheostat, a resistance winding, a slide bar spaced from said winding and extending longitudinally thereof, means for supporting said winding and said slide bar, and a slidable contact member carried by said bar, said member comprising a solid insulating body having a central portion and opposed wing portions extending downward, said central portion having a groove for receiving said bar so that said body saddles said bar, said wing portions having coaxial grooves in crossed perpendicular relation with said first groove and immediately adjacent thereto, a substantially inverted U-shaped contact blade seated in said coaxial grooves and underlying said bar, and a contact finger carried by said blade and slidably engaging said bar, the depending ends of said blade slidably engaging said winding, said contact blade being snugly embraced by the walls of said coaxial grooves, whereby backlash or lost motion of the contact blade is substantially prevented.

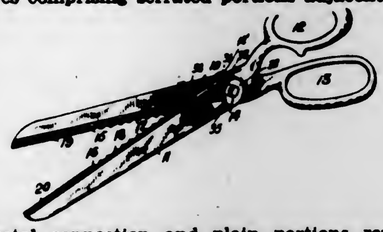
4. In a rheostat, a resistance winding, a hollow slide bar spaced from said winding and extending longitudinally thereof, a rotatable screw shaft of predetermined large pitch within said hollow slide bar, means for supporting said winding, said slide bar, and said screw shaft, and a slidable contact member carried by said slide bar, said member comprising a screw-engaging member and contact blades slidably engaging said resistance winding and said slide bar, whereby said contact member may be slidably moved by manually sliding the same or by rotating said screw shaft.



7. In a rheostat, a pair of end brackets connected together at their top portions by a slide bar, an insulating mandrel disposed between said brackets but having its ends free of mechanical attachment to said brackets, a resistance winding wound on said mandrel and terminating short of the ends thereof, a slider contact member mounted on said slide bar and slidably engaging said winding, a flat metallic strap wrapped tightly about said mandrel at each end of said winding and serving to secure the winding on the mandrel, and a rigid metallic bar extending longitudinally beneath each end portion of said mandrel through the corresponding end bracket and rigidly attached to the lower portions of the corresponding strap and said bracket but insulated from the latter, each said rigid bar being formed at its outer end to serve as a terminal, whereby said rigid bars secure the lower portions of said brackets to said straps, cooperate with said straps to support said mandrel and its winding firmly between the brackets, and electrically connect the ends of said winding to the outer terminal ends of the bars.

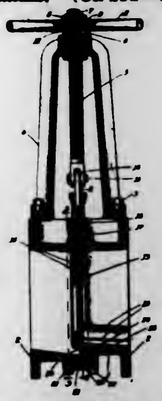
2,000,850
OUTLET BOX AND CABLE CLAMP
John Knoll, Aurora, Ill., assignor to All-Steel-Equip Company, Aurora, Ill., a corporation of Illinois
Application February 19, 1930, Serial No. 429,493
1 Claim. (Cl. 247—25)

In combination, a universal outlet box comprising a plurality of different shaped knock-outs for permitting a conduit or cable to be operatively connected to the box, at least one of said knock-outs being elongated, an elongated slot being provided when an elongated knock-out is removed, said elongated slot capable of receiving a pair of cables leading to the box, a clamping member having a part receivable in said elongated slot, said clamping member having means adapted to receive and support a pair of cables, and means for fastening a cable to said clamp and said clamp to said box.



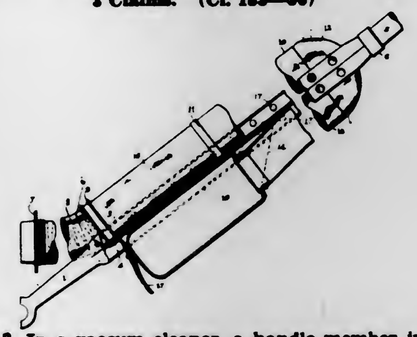
2,000,851
OUTLET BOX
John Knoll, Aurora, Ill., assignor to All-Steel-Equip Company, Aurora, Ill., a corporation of Illinois
Application March 14, 1931, Serial No. 522,553
6 Claims. (Cl. 247—25)

1. An outlet box comprising a body, a housing located outside of said box and rigidly fixed to an outer wall of said body, said housing when fastened to said wall having an open side, a clamp movably arranged in said housing and closing the said open side, screw means engageable with said clamp and a wall of said housing for clamping a cable in position relative to said box, said outer wall of said box having openings formed therein, and knock-outs in a wall of said housing and in alignment with the openings in said outer wall to receive a cable.



2,000,852
SHEARS
Edward H. Langbein, Brooklyn, N. Y., assignor to Samuel Brickman, Manhattan, N. Y.
Application September 26, 1932, Serial No. 634,804
2 Claims. (Cl. 164—81)

1. A cutting implement of the character described comprising a pair of pivotally connected blades, lips on said blades projecting at an angle therefrom, said lips being provided with cutting edges comprising serrated portions adjacent the

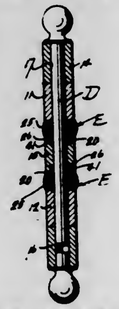


pivotal connection and plain portions remote from the pivotal connection.

2,000,853
VALVE
Joseph O. Lange, Chicago, Ill., assignor to Crane Co., Chicago, Ill., a corporation of Illinois
Application September 6, 1933, Serial No. 688,375
3 Claims. (Cl. 251—167)

1. In a valve, comprising a casing, a closure member therefor, an inlet to said closure member, said inlet being provided with peripherally arranged serrations extending longitudinally to the seating surface of said closure member.

2,000,854
TUBULAR FILTER
Ward Leathers, Haworth, N. J., assignor to The Quadrex Corporation, a corporation of Connecticut
Application December 12, 1930, Serial No. 501,876
Renewed March 24, 1934
3 Claims. (Cl. 183—36)



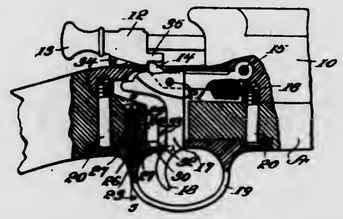
3. In a vaccum cleaner, a handle member including a longitudinal rigid separator, a plurality

of air filtering tubes, said separator being substantially H-shaped in cross section with said air tubes positioned within the same, on the opposite sides thereof said air filtering tubes communicating with each other at their upper ends, and a dirt receptacle in operable engagement with the lower end of one of said air filtering tubes.

2,000,855
METHOD OF DENICOTINIZING TOBACCO
Ludwig Max Lippmann and Arnold Faltelowitz, Berlin, Germany; said Faltelowitz assignor to said Lippmann
No Drawing. Application March 22, 1932, Serial No. 600,557. In Germany April 1, 1931
5 Claims. (Cl. 131—6)

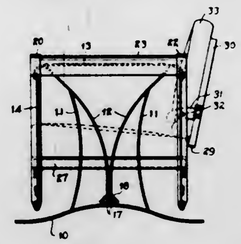
1. A method of denicotinizing tobacco comprising the steps of: wetting tobacco containing the usual bacteria, disposing the wetted tobacco loosely in layers and allowing the latter to stand with access of air thereto to produce fermentation of the tobacco, continuously adding acid to the extent necessary to neutralize the amino bases resulting from the fermentation, and drying the tobacco.

2,000,856
HINGE CONSTRUCTION
Arthur G. Lyons, Pennside, Pa., assignor to Reading Hardware Corporation, Reading, Pa., a corporation
Application March 27, 1933, Serial No. 663,016
5 Claims. (Cl. 16—136)



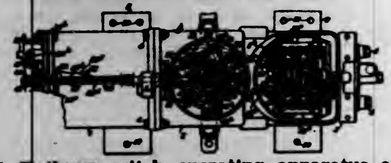
1. In a hinge the combination with separate leaves having pintle receiving knuckles and a connecting pintle passed therethrough, an anti-friction device interposed between the adjacent ends of knuckles of the opposed leaves and including races and an anti-friction element therebetween, and a wear-resisting member of better wear resisting material than the knuckle non-rotatably anchored in concealed relation within the end of a knuckle where the strain is received and having a race of the bearing resting thereupon.

2,000,857
ALUMINUM OXIDE ABRASIVE AND METHOD OF MAKING THE SAME
Jacob S. Masin, Anniston, Ala., assignor to Swann Research, Incorporated, a corporation of Alabama
Application December 1, 1930, Serial No. 499,238
4 Claims. (Cl. 51—279)



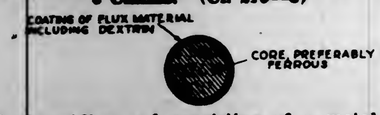
1. An alumina grain composed of fused alumina containing from 1.0 to 5.0% TiO_2, together with small amounts of silica and iron as impurities, the impurities being segregated in distinct masses within the crystals forming the individual grains thereof.

2,000,858
SAFETY DEVICE FOR FIREARMS
William Ray Maxwell, Hicksville, Ohio
Application July 5, 1933, Serial No. 679,107
1 Claim. (Cl. 42—70)



In a firearm, a stock, a barrel on the stock, a sear pivotally mounted in the stock, a firing bolt slidable with relation to the barrel and engaged by the sear for the locking of said bolt, a trigger pivoted to the sear and having a finger-engaging end projecting exteriorly of the stock, a trigger guard detachably fitting on the stock for the said trigger, a safety latch transversely of the said guard and rearwardly of the trigger and having a bit to engage the latter to hold the same latched when the firing bolt is cocked, means engageable with the safety latch to hold the same in latching or unlatching position with relation to the trigger, a wedge on the firing bolt and cooperating with the sear and a block on the trigger and cooperative with the wedge to prevent the latch being moved to safety unless the firing bolt is fully cocked.

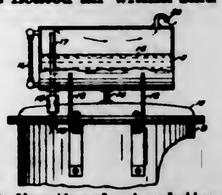
2,000,859
GLIDER
William R. McGowen, Pittsburgh, Pa., assignor to The McKay Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 29, 1933, Serial No. 704,449
3 Claims. (Cl. 5—124)



2. A glider comprising a pair of end frames each having a floor bar, a top rail, two uprights of spring metal connected at their lower ends to the floor bars, and respectively bent forwardly and rearwardly at their upper ends and connected to the ends of the top rails, a seat frame disposed between the end frames, and flexible suspending members respectively connected to the ends of the top rails and to the seat frame.

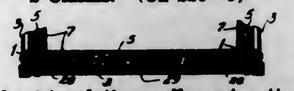
2,000,260
RAILWAY SWITCH OPERATING APPARATUS
William C. McWhirter and Edwin G. Little, Wilmerding, Pa., assignors to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application July 11, 1932, Serial No. 679,868
15 Claims. (Cl. 246—253)

1. Railway switch operating apparatus comprising a casing, a switch actuating shaft journaled in said casing, fluid pressure operated means for actuating said shaft between two extreme positions, valve mechanism for controlling the admission of fluid to said fluid pressure operated means, said valve mechanism having a first position in which the admission of fluid to said fluid pressure operated means is permitted and a second position in which the admission of fluid to said fluid pressure operated means is prevented, a cam secured to said switch actuating shaft, a motion plate movable between a first and a second position, means for moving said motion plate to its first position or its second position according as said valve mechanism is moved to its first or its second position, and a circuit controller controlled by said cam and said motion plate.



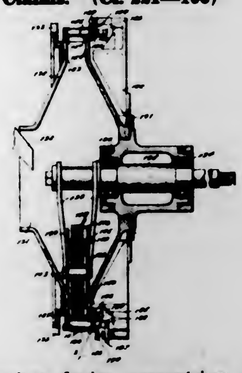
2,000,261
COATED WELDING ELECTRODE
Wilbur B. Miller, Flushing, N. Y., assignor to Oxweld Acetylene Company, a corporation of West Virginia
Application December 23, 1933, Serial No. 704,642
6 Claims. (Cl. 219—8)

1. A welding rod consisting of a metal core having a coating thereon, the coating consisting of slip clay 40–60 parts, iron oxide 20–30 parts, calcium carbonate 20–30 parts, feldspar 15–30 parts, rutile 5–20 parts, manganese ore 5–15 parts, carbonaceous material 5–15 parts, ferromanganese 5–20 parts, ferrochrome 2–8 parts and dextrin 1–15 parts by weight.



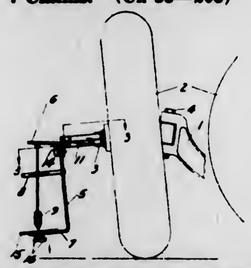
2,000,262
UNIDIRECTIONAL BREATHER
Louis C. Nichols, Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application May 14, 1931, Serial No. 537,303
15 Claims. (Cl. 220—85)

1. In combination, a casing for electrical apparatus, said casing containing a quantity of liquid at a higher temperature than the atmosphere and having an air space above the level of said liquid, said casing having an air vent above the level of said liquid, an air inlet conduit having an air inlet opening located below the level of said liquid and in communication with atmosphere, said inlet conduit extending parallel to said casing for substantially the same distance as the depth of the liquid within said casing, and means for securing said inlet conduit to said casing in heat conductive relation to said hot liquid so that heated air within said conduit in-



duces a uni-directional circulation of heated air through said air space and out through said vent whereby moisture within said air space is removed by said heated air.

2,000,263
HEAT INSULATING WALL CONSTRUCTION
Edward R. Powell, Alexandria, Ind., assignor, by mesne assignments, to Johns-Manville Products Corporation, New York, N. Y., a corporation of Delaware
Application October 15, 1928, Serial No. 312,543
2 Claims. (Cl. 220—9)

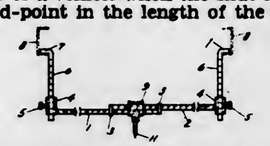


2. The heat insulating wall construction which comprises interior and exterior protective sheathings, insulation material therebetween affixed to said inner protective sheathing, a diaphragm with reflexed curvature attached by means of a flashing strip extending around the the edge of the insulation to said insulation material, defining a space with the exterior sheathing, and adapted to increase the space between said diaphragm and said insulation material when an increased pressure is set up within said insulation material, and at the same time substantially prevent any flow of air or other fluid from the exterior surrounding into the insulation material.

2,000,264
DISPENSING DEVICE
Jacob Schaub, Westfield, N. J., assignor, by mesne assignments, to The Best Foods, Inc., New York, N. Y., a corporation of Delaware
Original application January 19, 1927, Serial No. 161,972. Divided and this application March 12, 1932, Serial No. 598,223
21 Claims. (Cl. 221—106)

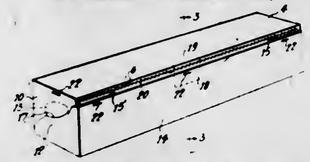
1. A dispensing device comprising a hollow member, charge dispensing members closing the periphery of said member, and means to charge said dispensing members and discharge them at substantially a single predetermined point in their movement.

2,000,265
KINGPIN ANGLE GAUGE
Dana Seger and Roy D. Smith, Davenport, Iowa, and Frank J. Franzen, Rock Island, Ill., assignors to Geo. L. Hunt Automotive Equipment Co., Davenport, Iowa
Application September 1, 1932, Serial No. 631,352
7 Claims. (Cl. 33—203)



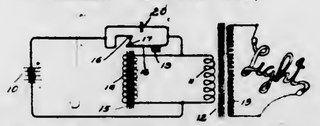
1. A king pin inclination gauge comprising a body member adapted to be supported upon an axle spindle to move therewith, a rectangularly graduated plate supported adjacent the lower end of the body member, a rigid pendulum supported from the upper part of the body member and having an indicating point adjacent the plate to cooperate with the graduations thereon to indicate movement of the pendulum relatively thereto, the plate being graduated to read correctly the inclination of the king pin of an automobile wheel when the spindle is turned through a definite angle about the king pin, and a guard mounted on the body between the plate and the upper part of the body to restrict the movement of the pendulum with respect to the plate but permit it to have free movement over the entire surface of the plate.

6. An implement for the purpose indicated comprising a body member having laterally projecting arms adjacent its normally upper and lower ends, a rectangularly graduated plate supported by the normally lower arm for sliding movement with relation thereto to secure proper adjustment, a rigid pendulum supported from the upper arm and provided with a free point at its lower end adjacent the graduated plate, and a clamp secured to the upper part of the body member and adapted to grip the spindle nut of an automobile wheel, said implement having a pendulum guard surrounding the pendulum and secured to the body member, the guard permitting free swinging of the pendulum over the entire surface of the graduated plate but restricting movement of the pendulum to the vicinity of the plate.



2,000,266
CHASSIS CHECKING GAUGE
Roy D. Smith, Davenport, Iowa, assignor to Bee Line Manufacturing Company, Davenport, Iowa, a corporation of Iowa
Application April 16, 1934, Serial No. 720,741
10 Claims. (Cl. 33—191)

1. In a chassis checking apparatus, a composite bar comprising graduated bars held together in side-by-side relation for relative sliding motion, a slide embracing the graduated bars and carrying a plurality of sighting points defining a line substantially perpendicular to the axis of the composite bar and adapted to be placed in the mid-plane of a vehicle when the slide is adjusted to the mid-point in the length of the composite



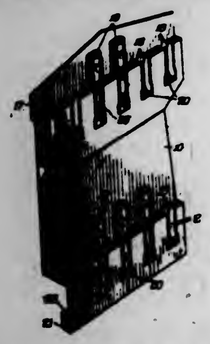
bar, said composite bar having at its ends means for engaging opposite parts of the sides of the frame of a vehicle.

2,000,267
DISPENSER FOR ROLLED MATERIAL
Louis C. Spalde, Brooklyn, N. Y., assignor to Waxed Products Company, Inc., Brooklyn, N. Y., a corporation of New York
Application June 17, 1933, Serial No. 676,255
3 Claims. (Cl. 206—58)

1. A box blank for folding into a box for dispensing rolled material, scored vertically to define an end wall, a front wall, a second end wall, a rear wall and a third end wall, all in alignment and scored horizontally to define, adjacent the rear wall, a top or cover section, and a cover flap for the box, and, adjacent the front wall, a bottom member and a supplemental rear wall member, one of said last mentioned members being scored vertically to define extensions thereto, and the other being cut vertically in alignment with the scoring on the first said member as far as the horizontal scoring separating said members from each other, said first mentioned rear wall being of slightly less depth than said supplemental rear wall member, slits in said end walls, and tongues on said extensions adapted to fit into said slits.

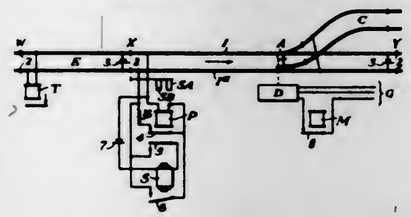
2,000,268
POWER CONVERTING UNIT AND SYSTEM
Jerome Nathan Stowell, Fargo, N. Dak.
Application May 10, 1933, Serial No. 670,384
Renewed March 16, 1935
5 Claims. (Cl. 176—124)

1. The method of illuminating a lamp of the neon-gas tube-type substantially equally throughout its length, and without objectionable flicker, which comprises the steps of drawing a current from a low potential source, dividing the current into two portions, passing one of said portions through the coil of an electromagnet, utilizing the magnetic force developed by said electromagnet to rapidly and repeatedly interrupt the entire current drawn from the source with such rapidity as to avoid flicker and with such ratio of "make" to "break" that the illuminating current derived by the method has the opposite sides of its cycle substantially equal, and passing the other portion of the current in parallel with the first portion through the pri-



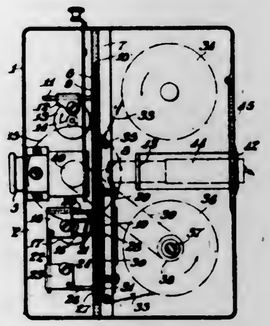
mary of a step-up transformer and utilizing the magnetic flux developed by the said other part of said current solely for operation of said step-up transformer to produce a current of high voltage and of an alternating character with the opposite sides of its cycle sufficiently equal to illuminate said lamp substantially equally throughout its length.

2,000,869
TIRE CONSTRUCTION
Raymond S. Taylor, Akron, Ohio, assignor to The Firestone Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
Application July 11, 1933, Serial No. 679,917
8 Claims. (Cl. 152—13)



1. A tire construction consisting of a pneumatic tire casing having an excessive amount of free sulphur in the bead regions thereof as compared to other parts of the tire.

2,000,870
FOLDING DISPLAY AND PACKAGE
Henry Heinemann, Chicago, Ill., assignor to Chicago Cardboard Company, Chicago, Ill., a corporation of Illinois
Application November 7, 1933, Serial No. 641,551
19 Claims. (Cl. 206—44)

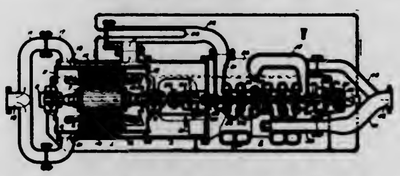


3. The combination with a display sheet having means formed of the sheet itself and in rows at spaced distances and comprising scored and cut portions offset in folding the sheet to form open topped containers therein for individually supporting articles for display and foldable upon itself between rows to engage and hold such articles in place and to form a compact container package.

2,000,871
RAILWAY TRAFFIC CONTROLLING APPARATUS
Earl M. Allen, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application May 12, 1934, Serial No. 725,313
21 Claims. (Cl. 246—41)

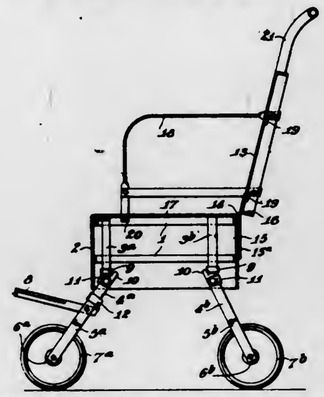
1. In combination, a section of railway track containing a switch, a source of track circuit current connected across the rails of said section, a primary track relay and a secondary track relay, a pick-up circuit for said primary relay connected across the rails of said section and including a front contact of said secondary relay, a holding circuit for said primary relay connected across the rails of said section and including a front contact of the primary relay, means for connecting said secondary relay across the rails of said section through a back contact of said primary relay and an auxiliary source of current, and means for controlling said switch by said relays.

2,000,872
MOTION PICTURE APPARATUS
Arthur Allen Andrews, Tiptree, England
Application April 25, 1934, Serial No. 722,330
In Great Britain March 28, 1933
1 Claim. (Cl. 88—18.4)



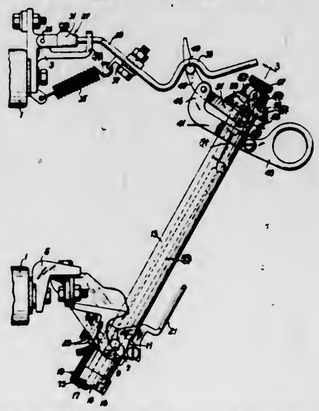
In apparatus for taking and/or projecting motion pictures, the combination of film-feeding mechanism comprising a rotatable disc, an eccentrically positioned pin on said disc, a feeding claw pivotally mounted on said pin, prongs on said claw adapted to engage into the film perforations, a guide member for said feeding claw, comprising a plate slidably mounted in a guideway disposed parallel to the film track and a pin affixed to and projecting at right angles from said plate and slidably engaging the claw, a film-retention mechanism comprising a block pivotally mounted on a pin secured in a fixed part of the structure, and a film-engaging and retaining pin pivotally attached to said block, and an arm pivotally connected to the feed claw and slidably engaging the block of the retaining mechanism for oscillating said block as a result of changes in the angular disposition of the arm produced by the circular motion of the feed claw and thereby moving the retaining pin into engagement with the film when the feeding claw disengages therefrom and vice versa.

2,000,873
PNEUMATIC CORE MATTRESS
Edward W. Arens, Cleveland, Ohio, assignor to The Air Cushion Products Company, Cleveland, Ohio, a corporation of Ohio
Application August 25, 1934, Serial No. 741,391
2 Claims. (Cl. 5—348)



1. A combined pneumatic and padded mattress, comprising a central pneumatic core formed of two sheets permanently vulcanized together, in flat form, along their outer edges and at spaced areas throughout, the vulcanized areas being perforated centrally for receiving tufting threads, the distances between the spaced vulcanized areas being graduated and increasing from the longitudinal edges towards the center, in order to produce a core which is thicker along its longitudinal central portion than along its longitudinal edges when inflated, layers of padding built around the core, and tufting threads extending through the perforations and the layers of padding, for uniting the core and the layers of padding into one structure.

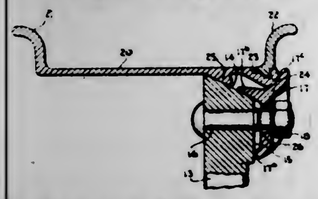
2,000,874
PUMP UNIT
Charles L. Babb, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application June 14, 1933, Serial No. 675,666
5 Claims. (Cl. 103—87)



1. In a fluid pumping unit, an electric motor having a fluid tight housing inclosing a stator and a rotor and bearings for said rotor arranged externally of the housing, a jacket coaxially surrounding said housing in sealing engagement therewith, a suction pipe discharging into said jacket and constituting a guard for one of said bearings, a pump having a shaft driven by said motor and having a casing, journal and thrust bearings for said shaft, said bearings being arranged externally of the casing thereof, means for connecting said casing with said jacket in alinement therewith, means for conducting fluid from said jacket to the inlet of said pump, and a discharge pipe for said pump, said discharge pipe constituting a guard for one of said journal bearings and for said thrust bearing.

2,000,875
CHILD'S FOLDING PUSH-CHAIR
Maurice Louis Bernon, Westbourne Grove, England, assignor to The B. W. S. Company Limited, Ealing, London, England
Application February 20, 1933, Serial No. 657,688
In Great Britain October 24, 1932
4 Claims. (Cl. 280—37)

1. A folding child's push chair comprising an inverted attaché case body open at one end and a lid pivotally secured to said body for covering the open end thereof, a main frame mounted in the body, independent front and rear substructures carrying pairs of front and rear supporting wheels pivotally connected to said main frame adapted to be raised vertically into said case body, and arm supporting means pivotally connected to said lid, adapted to be folded thereinto, said frame and arm supporting means including locking means adapted to interlock said lid and arm rests in predetermined position.



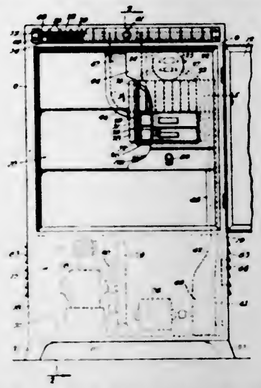
2,000,876
FUSE SWITCH
Lester Pierce Boll, University City, and Theodore Birkenmaier, St. Louis, Mo., assignors to W. N. Matthews Corporation, St. Louis, Mo., a corporation of Missouri
Application November 10, 1934, Serial No. 752,430
5 Claims. (Cl. 200—116)

1. In a fuse switch, line terminals, one of which has socket means and the other of which has

movable and resilient detent means extending therefrom, a cartridge comprising a lower terminal engaging element adapted to cooperate with said socket means, said cartridge comprising a tube, a fuse link attached to said terminal engaging element and passing through said tube, an upper terminal engaging element on the tube, said upper terminal engaging element comprising a member affixed to the tube, a lever pivoted to said fixed member, means on one end of the lever engageable with said detent means, the other end of said lever swinging in an arc directed substantially along the axis of said tube, a cap at the upper end of said tube, means for attaching the fuse link to said cap, and link means pivoted to said other end of said lever and to said cap and adapted to transmit the longitudinal motion of the end of the lever along the tube to said cap.

2,000,877
VEHICLE WHEEL
Winfield S. Brink, Akron, Ohio, assignor to The Firestone Steel Products Company, Akron, Ohio, a corporation of Ohio
Application June 21, 1933, Serial No. 676,770
2 Claims. (Cl. 301—12)

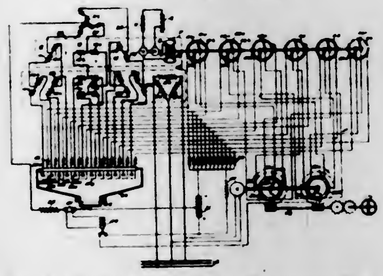
2. In a vehicle wheel, the combination of a hub and spoke structure, the spokes of which have beveled end faces, an annular rim having a marginal gutter, means for supporting the rim, at points axially spaced from said marginal gutter, upon said beveled end faces of the spokes, and clamps on the respective spokes engaging said marginal gutter, said clamps having portions thereof engaging the beveled ends of the spokes.



2,000,878
ACETIC ACID
Edgar C. Britton, Howard S. Nutting, and Myron E. Bleecker, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
No Drawing. Application December 6, 1933, Serial No. 701,183
8 Claims. (Cl. 260—116)

1. The method which comprises reacting propylene with an aqueous alkali metal hydroxide solution, and thereafter separating an acetate product from the reacted mixture.

8. In a method of making an alkali metal acetate, the step which consists in heating a gaseous hydrocarbon mixture containing ethylene and propylene with an aqueous alkali metal hydroxide solution in the presence of an inorganic basic aluminum compound under pressure to a temperature between about 350° C. and about 390° C., whereby ethylene and propylene both react to form alkali metal acetate.



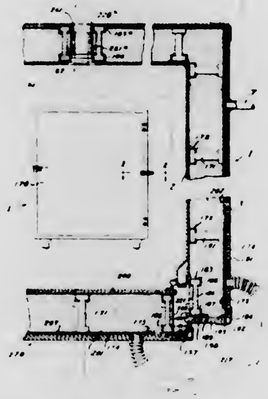
2,000,879
DOMESTIC REFRIGERATOR
Robert C. Brown, Jr., Evanston, Ill.
Application March 21, 1932, Serial No. 600,135
7 Claims. (Cl. 62—116)

1. A domestic refrigerator comprising an insulated cabinet having a food chamber therein, a door in a side wall of said chamber through which access is had to said chamber, a cooling unit associated therewith comprising a header, refrigerant ducts depending from the header and forming an intermediate freezing zone, ice trays supported in the freezing zone, a tortuous air con-

duit in the freezing zone, and means for forcing air from the exterior of the cabinet through the conduit and discharging it back into the room at a reduced temperature, said conduit preventing its mingling with the air in said compartment.

2,000,880
MOTOR CONTROL SYSTEM
Gustav Brunner, Baden, and Erwin Kern, Ennetbaden, Switzerland, assignors to Aktiengesellschaft Brown Boveri & Cie., Baden, Switzerland, a joint-stock company of Switzerland
Application November 7, 1934, Serial No. 751,822
In Germany June 3, 1933
13 Claims. (Cl. 172—274)

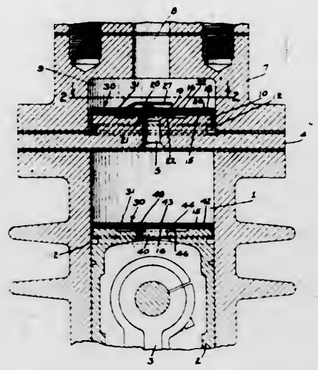
2. In a control system, an electric current supply line, a dynamo electric machine, an electric valve invariably connected with said machine and with said line for controlling the flow of energy therebetween, means for controlling the conductivity of said valve effective to control the said flow of energy during motoring operation of said machine, and means for controlling the conductivity of said valve effective to control the said flow of energy during generating operation of said machine, the direction of flow of energy between said machine and said line being determined by the relative values of the impressed and induced voltages of said machine.



10. In combination, a polyphase alternating current supply circuit, a dynamo electric machine operable as a motor and operable as an electric current generator comprising a winding

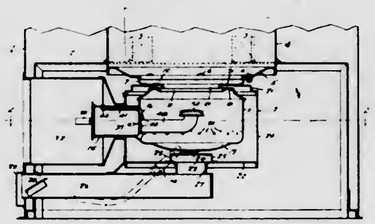
divided into a plurality of sections arranged and connected to form a plurality of groups equal in number to the number of phases of said circuit, means linking each said group of winding sections with a different phase of said circuit, electric valve means included in the connections of said winding sections for controlling the flow of current therethrough, means actuated by said machine during each said operation thereof for controlling the conductivity of said valve means, and means interlinking said winding sections to cause current to flow simultaneously through a winding section of each said group thereof at every instant.

2,000,881
METHOD OF PURIFYING TETRACHLOROETHYLENE
Gerald H. Coleman, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
No Drawing. Application November 20, 1933, Serial No. 698,927
6 Claims. (Cl. 260—162)



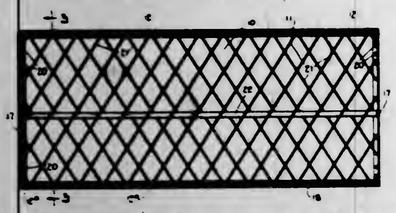
1. In a method of purifying tetrachloroethylene, the steps which consist in treating impure tetrachloroethylene with about 1 per cent its weight of aluminum chloride at above room temperature and thereafter distilling the mixture to separate purified tetrachloroethylene therefrom.

2,000,882
INSULATING HOUSING
Daniel F. Comstock, Boston, Mass., assignor, by mesne assignments, to Stator Refrigeration, Inc., a corporation of Delaware
Original application September 7, 1928, Serial No. 304,589. Divided and this application March 20, 1930, Serial No. 437,377
4 Claims. (Cl. 220—9)



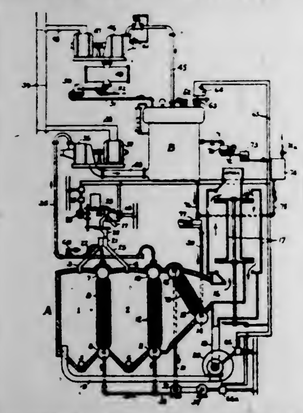
1. In combination, a heat insulating housing, said housing having a swinging closure, the walls of the housing including the closure being hollow and containing a gas pervious filler, a flexible gas duct connecting the closure with one of the fixed walls of the housing, and air passageways extending along the filler and being substantially coextensive with the wall area of the housing, said passageways communicating with the flexible gas duct and a second gas duct communicating with said passageways for connection to exterior evacuating means.

2,000,883
VALVE
Harry E. Cullen and Henry O. Ronning, Minneapolis, Minn., assignors to Henry P. Watson, Minneapolis, Minn.; Alfred F. Pillsbury and Bessie Watson executors of said Henry P. Watson, deceased
Application March 7, 1932, Serial No. 597,363
20 Claims. (Cl. 230—221)



1. In a device of the class described, a structure having a passage to be controlled, a spring metal flap valve structure operatively associated with the passage, a second spring metal flap valve structure having a finger which engages the flap portion of the first valve to yieldably resist its opening movement, and a spring metal cap acting by resiliently initiated pressure to secure the elements sealingly against one another and against the structure.

2,000,884
OIL BURNER
John Alger Dahlstrom, Bay Village, and William A. Bryson, Lakewood, Ohio, assignors to Perfection Stove Company, Cleveland, Ohio, a corporation of Ohio
Application October 5, 1933, Serial No. 692,306
17 Claims. (Cl. 158—92)

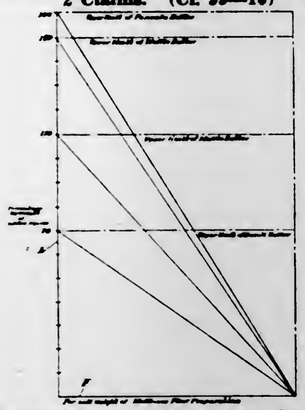


1. In combustion apparatus, a burner bowl, a housing enclosing and spaced from the bowl and having an air admitting opening, the bowl being provided with means for admitting air adjacent its periphery from the space between the housing and bowl, air conducting means extending from a point outside the housing into the bowl from one side and above the bottom thereof and terminating approximately centrally of the bowl, and means for delivering fuel to the bowl.

2,000,835
SPANDREL TRUSS
Robert L. Davison, New York, N. Y., assignor to John B. Pierce Foundation, New York, N. Y., a corporation of New York
Application April 25, 1932, Serial No. 607,389
9 Claims. (Cl. 72—1)

1. An improved spandrel truss comprising a relatively light open mesh framework of metal, a floor joist supporting beam in addition to the framework extending laterally thereof and parallel to but spaced apart from the upper and lower edges of the truss and means enclosing said structure and forming the same into a unitary structure.

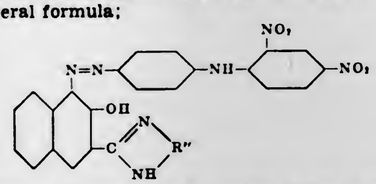
2,000,836
METHOD OF HEAT TRANSFER
Herbert H. Dow, deceased, late of Midland, Mich., by Willard H. Dow and Clara Turner, administrators, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
Application November 2, 1931, Serial No. 572,741
2 Claims. (Cl. 122—33)



1. The method of transferring heat which comprises heating a body of diphenyloxide to a temperature between 500° and 750° F. and passing the same in indirect heat transfer relation with a body of a material to be heated.

2,000,837
VISCOSE SOLUTION
Richard Klemer, Elizabethton, Tenn., assignor to North American Rayon Corporation, a corporation of New York
No Drawing. Application July 7, 1933, Serial No. 679,299
4 Claims. (Cl. 106—40)

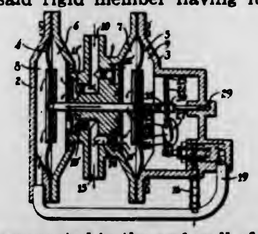
1. A viscose solution containing a dithio-carbonic acid starch ester.



2,000,838
MULTIUSE BATTER PRODUCT
Augustus H. Fiske, Warren, Bevan W. Colby, Providence, and Georgia B. Lewis, Rumford, R. I., assignors to Rumford Chemical Works, Rumford, R. I., a corporation of Rhode Island
Application January 18, 1934, Serial No. 707,136
2 Claims. (Cl. 99—10)

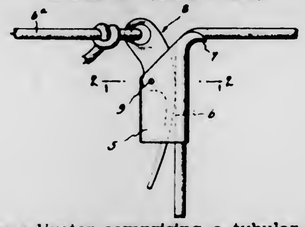
1. A dry multi-use batter product for the range of products including biscuits, muffins, waffles and pancakes, comprising a soft wheat cereal base approximately 82.36%, adequate free leavening reactants about 4.27% dispersed therein, whole egg product approximately .82% including yolks and whites, powdered whole milk 3.29%, granulated sugar 2.47%, salt 1.85% and a shortening of hydrogenated oil character 4.94%, the addition of indicated gradation of liquid yielding characteristic batters from which the said articles can be cooked.

2,000,839
DIRECT DEVELOPED AZO DYES AND THEIR PRODUCTION
Ernest F. Grether and Gerald H. Coleman, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
No Drawing. Application October 19, 1929, Serial No. 401,012
5 Claims. (Cl. 260—95)



2. As a new product, an azo dye having the general formula;

wherein R'' represents a residue of the benzene series.



2,000,890
MOTOR
Henry Hueber, Buffalo, and Erwin C. Horton, Hamburg, N. Y., assignors to Trico Products Corporation, Buffalo, N. Y.
Application June 7, 1932, Serial No. 615,920
5 Claims. (Cl. 121—48)

1. A fluid motor comprising a casing having end compartments with an intermediate body portion, each compartment being partitioned by a diaphragm to define a motor chamber, inlet and outlet ports for the chambers, a connecting rod between the two diaphragms guidingly supported in the intermediate body portion, a rigid member extending from the outer side of one of the diaphragms substantially axially of the connecting rod, said rigid member having its free end

guidingly supported in the end wall of said casing whereby the attached diaphragm is guidingly supported at its opposite sides by said rod and said rigid member, said rigid member and said connecting rod being rigidly fixed to said attached diaphragm, and automatic valve mechanism operable by said rigid member for operatively admitting fluid to said motor chambers.

2,000,891
LINE ADJUSTER
John Kries, Glendale, N. Y.
Application January 18, 1933, Serial No. 652,409
1 Claim. (Cl. 24—133)

A line adjuster comprising a tubular member thru which a line may be passed, and a lever pivotally connected to said member and passing therethrough with ends exposed and adapted when pulled at one end to press a line against said member and when pulled at its other end to release its pressure on the line, said tubular member having a lip extending at an angle to the body portion for the accommodation of the line, said lever having a convex cam surface extending from end to end on the side adjacent the rope and having an aperture in one end thru which a rope may be passed for the purpose of tying, that end of said lever opposite the apertured end being free and sufficiently exposed to constitute a handle portion by which the lever may be moved.

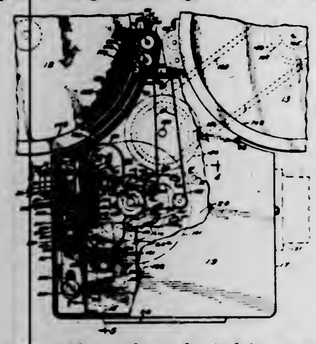
2,000,892
PROCESS OF CANNING CORN
Harold R. Lewis, Hoopeston, Ill.
No Drawing. Application August 15, 1933, Serial No. 685,278
12 Claims. (Cl. 99—8)

1. The method of preparing and canning different grades or styles of green corn from field run corn, which includes severing the top portions of the kernels from the cobs, then removing the remaining portions of the kernels from the cobs and maintaining them separate from the tops, subjecting the kernel tops to a grading operation in a suitable liquid bath wherein the heavier kernel tops will sink and the lighter ones float, removing the lighter and heavier kernel tops in separate groups, mixing the heavier group of kernel tops with the kernel portions last removed from the cobs, and separately canning the mixed corn and the lighter kernel tops.

2,000,893
CURLING DEVICE
Ross M. McFadden, Glendale, Calif.
Application June 6, 1932, Serial No. 615,600
2 Claims. (Cl. 132—41)

1. In a curling device, a tube provided with a plurality of transverse perforations throughout its length, a clip having end portions in overlapped relation secured to said tube, the said clip being formed with bowed side members adapted to diametrically overlie the said tube, and a roller carried by the clip and adapted to in part be received within an end of the tube to maintain the clip parallel to the longitudinal axis of the tube.

2,000,894
CURLER
Ross M. McFadden, Glendale, Calif.
Application July 10, 1934, Serial No. 734,485
8 Claims. (Cl. 132—41)



1. In a curling device, an elongated conical tube provided with a plurality of transverse perforations throughout its length, a clamp having end portions in overlapped sliding relation secured to said tube at one end thereof, the said clamp adapted to diametrically embrace the said tube, and a resilient rubber wheel carried by the clamp and adapted to in part be received within an end of the tube to maintain the clamp parallel to the longitudinal axis of the tube.

2,000,895
MOTION PICTURE CAMERA
Harry R. Schenck, Jr., Palisade, N. J.
Application August 26, 1932, Serial No. 630,517
2 Claims. (Cl. 88—18.4)

1. In a motion picture camera, a casing, a wall mounted therein having a shutter opening, a pair of parallel shafts rotatably mounted within said casing, a member pivoted within said casing and having a portion movable into covering and uncovering position with respect to said opening, a cam mounted on one of said shafts, a yoke receiving said cam and having an arm pivotally connected to said pivoted member whereby upon rotation of said cam, said pivoted member will be moved into and out of said covering position, a pin fixed within said casing, a member having an elongated slot slidably receiving said pin and provided with a pair of parallel arms, an eccentric disc fixed to said first shaft and received between said parallel arms for reciprocating said member, a cam on said second shaft, said member being provided with an opening forming a pair of parallel edges, said last mentioned cam being received within said opening and contacting said

edges, means for simultaneously rotating said shafts whereby said member may oscillate about said pin during the reciprocation thereof, and

means on said member adapted to engage a strip of film for advancing the same across said shutter opening.

2,000,896

TAG HOLDER FOR MINE CARS

Oscar J. Mustard, Pocahontas, Va., assignor of one-half to J. Powell Royall, Tazewell, Va.

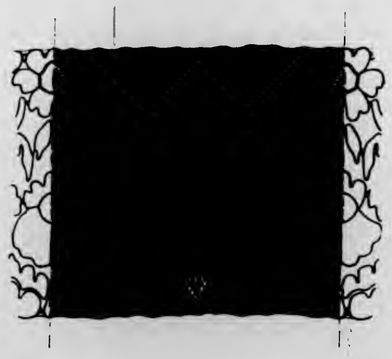
Application January 30, 1934, Serial No. 709,014

3 Claims. (Cl. 40—15)

2. In combination, a mine car having a side wall provided with a slot, a tag holder in the form of a hook including a shank and an integral U-shaped head, said head being arranged to work through said slot, and to normally lie within the slot with the open end of the U-shaped head projecting inwardly of the mine car, and a plate pivoted within the car and attached to said shank.

DESIGNS

MAY 7, 1935



95,478

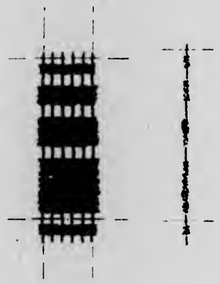
DESIGN FOR A LACE

William Roger Adaire, Washington, R. I., assignor to Gehring, Solomon & Birnbaum, Inc., New York, N. Y., a corporation of New York

Application February 28, 1935, Serial No. 55,657

Term of patent 3½ years

The ornamental design for a lace as shown and described.



95,479

DESIGN FOR LACE

Esther Alper, Brooklyn, N. Y.

Application February 1, 1935, Serial No. 55,192

Term of patent 3½ years

The ornamental design for lace, as shown and described.

95,480

DESIGN FOR A SHOE

Thomas R. Atkins, Cliftondale, Mass., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts

Application February 14, 1935, Serial No. 55,426

Term of patent 3½ years

The ornamental design for a shoe substantially as shown and described.

95,481

DESIGN FOR A SHOE

Thomas R. Atkins, Cliftondale, Mass., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts

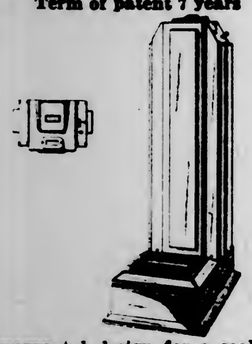
Application February 14, 1935, Serial No. 55,427

Term of patent 3½ years

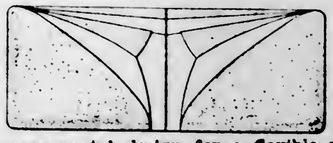
The ornamental design for a shoe substantially as shown and described.

95,482
DESIGN FOR A TABLE CENTERPIECE
Norman Bel Geddes, New York, N. Y., assignor to Revere Copper and Brass Incorporated, Rome, N. Y., a corporation of Maryland
Application February 13, 1935, Serial No. 55,392
Term of patent 7 years

The ornamental design for a table centerpiece, substantially as shown and described.

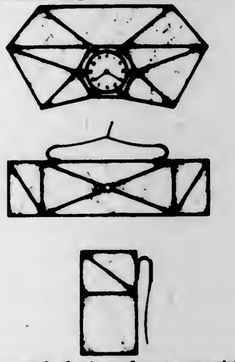


95,483
DESIGN FOR A HAND BAG OR THE LIKE
Benjamin Blacher, Providence, R. I., assignor to Blacher Brothers, Providence, R. I., a partnership composed of Benjamin Blacher and Harry Blacher
Application May 27, 1933, Serial No. 48,223
Term of patent 3½ years



The ornamental design for a handbag or the like, substantially as shown.

95,484
DESIGN FOR A SCALE CASING
Alfred Bousfield, Brooklyn, N. Y.
Application March 9, 1935, Serial No. 55,794
Term of patent 7 years

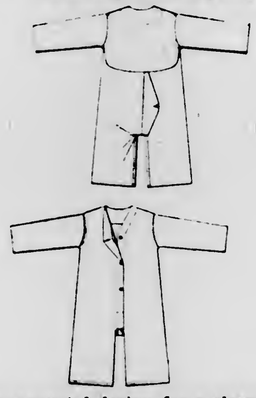


The ornamental design for a scale casing, as shown.

95,485
DESIGN FOR A FLEXIBLE POCKET RECEPTACLE
Warner R. Buxton, Longmeadow, Mass.
Application August 20, 1934, Serial No. 52,998
Term of patent 14 years

The ornamental design for a flexible pocket receptacle substantially as shown, and described.

95,486
DESIGN FOR A COMBINED LAMP AND CLOCK CASE
Clem L. Connally, Fort Worth, Tex.
Application September 17, 1934, Serial No. 53,312
Term of patent 7 years

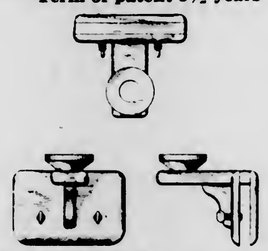


The ornamental design for a combined lamp and clock case substantially as shown.

95,487
DESIGN FOR A BOX COVER
Martha Hallowell Connor, Baltimore, Md., assignor to The Tin Decorating Company of Baltimore, Baltimore, Md., a corporation of New Jersey
Application February 8, 1935, Serial No. 55,320
Term of patent 14 years

The ornamental design for a box cover, as shown.

95,488
DESIGN FOR A SLEEPING GARMENT OR SIMILAR ARTICLE
Louis Davis, Brooklyn, N. Y.
Application September 4, 1934, Serial No. 53,193
Term of patent 14 years

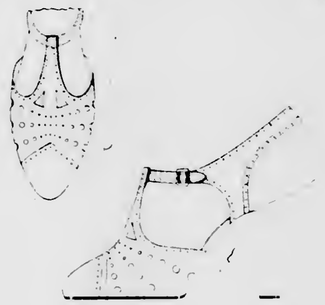


The ornamental design for a sleeping garment or similar article as shown and described.

95,489
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE OF MANUFACTURE
Gertrude Deist, New York, N. Y.
Application January 10, 1935, Serial No. 54,790
Term of patent 3½ years

The ornamental design for a textile fabric or similar article of manufacture, as shown and described.

95,490
DESIGN FOR A LAMP BRACKET
Herman E. De Vries, New York, N. Y., assignor to H. T. Cushman Mfg. Co., North Bennington, Vt.
Application February 7, 1935, Serial No. 55,293
Term of patent 3½ years

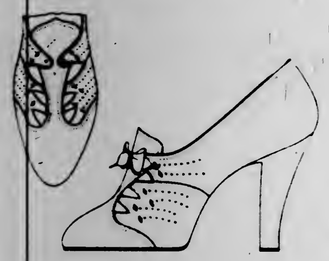


The ornamental design for a lamp bracket substantially as shown.

95,491
DESIGN FOR A SHOE
Ernest C. Doring, Quincy, Mass., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,422
Term of patent 3½ years

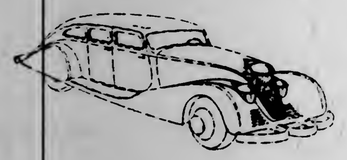
The ornamental design for a shoe substantially as shown and described.

95,492
DESIGN FOR A SHOE
Ernest C. Doring, Quincy, Mass., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,423
Term of patent 3½ years



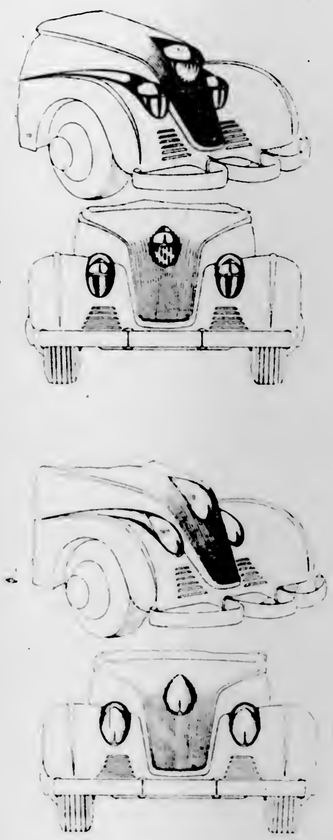
The ornamental design for a shoe substantially as shown and described.

95,493
DESIGN FOR A SHOE
Ernest C. Doring, Quincy, Mass., assignor to Schoinick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,424
Term of patent 3½ years



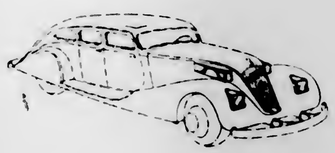
The ornamental design for a shoe substantially as shown and described.

95,494
DESIGN FOR A SHOE
Ernest C. Doring, Quincy, Mass., assignor to Schoinick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,425
Term of patent 3½ years

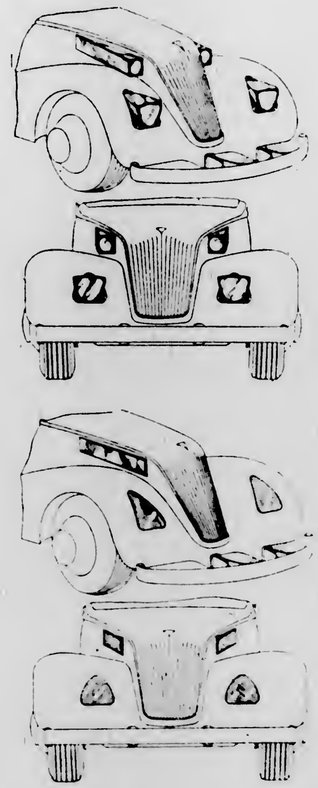


The ornamental design for a shoe substantially as shown and described.

95,495
DESIGN FOR AUTOMOBILE
Harley J. Earl, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 13, 1935, Serial No. 55,378
Term of patent 14 years

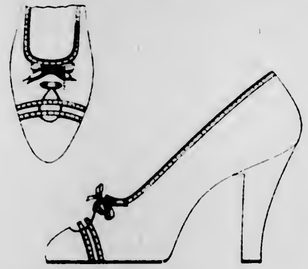


95,495—Continued



The ornamental design for automobile as shown and described.

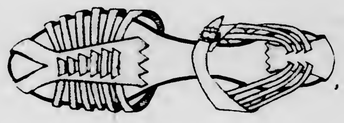
95,496
DESIGN FOR AUTOMOBILE
Harley J. Earl, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 13, 1935, Serial No. 55,379
Term of patent 14 years



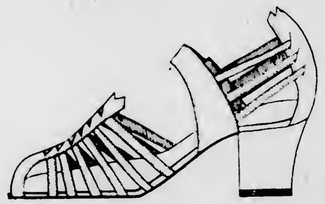
95,496—Continued

The ornamental design for automobile as shown and described.

95,497
DESIGN FOR A SHOE
Jacob Fishman, Brooklyn, N. Y., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,420
Term of patent 3½ years

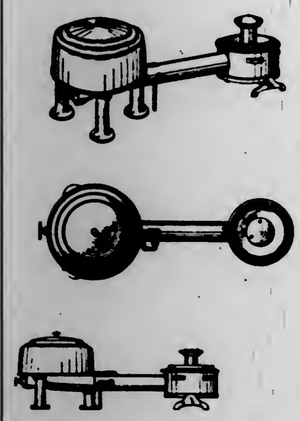


The ornamental design for a shoe substantially as shown and described.



95,498
DESIGN FOR A KNITTED HAND-COVERING
Alexander J. Friedlander, Milwaukee, Wis., assignor to M. Friedlander Knitting Company, Milwaukee, Wis., a corporation of Wisconsin
Application January 19, 1935, Serial No. 54,927
Term of patent 7 years

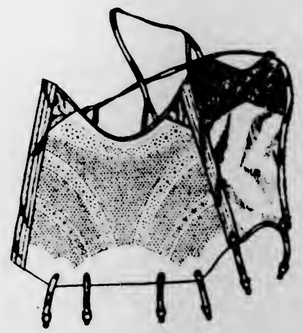
The ornamental design for a knitted hand-covering, substantially as shown and described.



95,499
DESIGN FOR A SANDAL
Dave Gilbert, New York, N. Y.
Application March 18, 1935, Serial No. 55,922
Term of patent 3½ years

The ornamental design for a sandal, substantially as shown.

95,500
DESIGN FOR AN OIL BURNING APPARATUS OR SIMILAR ARTICLE
Jackson G. Gilmore and Harold B. Donley, Columbus, Ohio, assignors to Franklin Oil Heating Inc., Columbus, Ohio, a corporation of Ohio
Application September 19, 1934, Serial No. 53,332
Term of patent 7 years



The ornamental design for an oil burning apparatus or similar article, as shown.

95,501
DESIGN FOR A WINE GLASS
James Graham Green, Colorado Springs, Colo.
Application February 1, 1935, Serial No. 55,203
Term of patent 7 years

The ornamental design for a wine glass as shown.

95,502
DESIGN FOR A CORSELETTE
Jeanne F. Greig, London, England, assignor to The Charnaux Patent Corset Company Limited, London, England
Application March 5, 1935, Serial No. 55,746
In Great Britain January 25, 1935
Term of patent 14 years

The ornamental design for a corselette, as shown.

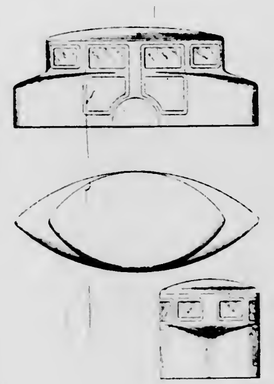
95,503
DESIGN FOR A VASE
Lurelle Guild, Noroton, Conn., assignor to Kensington, Incorporated, New Kensington, Pa., a corporation of Pennsylvania
Application October 11, 1934, Serial No. 53,559
Term of patent 3½ years

The ornamental design for a vase, as shown.

95,504
DESIGN FOR A VASE
Lurelle Guild, Noroton, Conn., assignor to Kensington, Incorporated, New Kensington, Pa., a corporation of Pennsylvania
Application October 11, 1934, Serial No. 53,560
Term of patent 3½ years

The ornamental design for a vase as shown.

95,505
DESIGN FOR A VASE
Lurelle Guild, Noroton, Conn., assignor to Kensington, Incorporated, New Kensington, Pa., a corporation of Pennsylvania
Application October 11, 1934, Serial No. 53,561
Term of patent 3½ years



The ornamental design for a vase as shown.

95,506
DESIGN FOR A BOTTLE
William Guyer, New York, N. Y., assignor to Joseph E. Seagram & Sons, Inc., Lawrenceburg, Ind., a corporation of Indiana
Application February 27, 1935, Serial No. 55,643
Term of patent 14 years

The ornamental design for a bottle as shown.

95,507
DESIGN FOR A TOURING CAR BODY
John O. Heinze, Detroit, Mich., assignor to Heinze Development Company, Detroit, Mich., a corporation of Michigan
Application February 18, 1935, Serial No. 55,482
Term of patent 7 years

The ornamental design for a touring car body, as shown.

95,508
DESIGN FOR A DRESS
Philip Heit, New York, N. Y.
Application March 5, 1935, Serial No. 55,745
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

95,509
DESIGN FOR A CHECK WRITER
John F. Hunter, East Orange, N. J., assignor to Safeguard, Inc., New York, N. Y., a corporation of Delaware
Application February 23, 1935, Serial No. 55,587
Term of patent 14 years

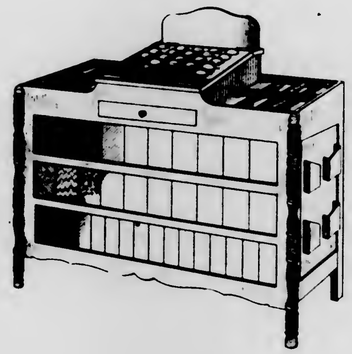
The ornamental design for a check writer, substantially as shown.

95,510
DESIGN FOR A SHOE
Morris Kalmon, St. Louis, Mo.
Application December 6, 1934, Serial No. 54,366
Term of patent 3½ years

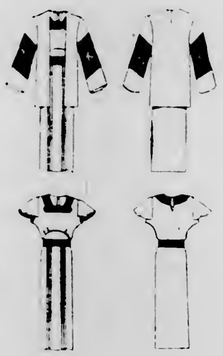
The ornamental design for a shoe substantially as shown and described.

95,511
DESIGN FOR A SHOE
Nathan Kenneth Kean, New York, N. Y.
Application March 11, 1935, Serial No. 55,809
Term of patent 3½ years

The ornamental design for a shoe as shown.

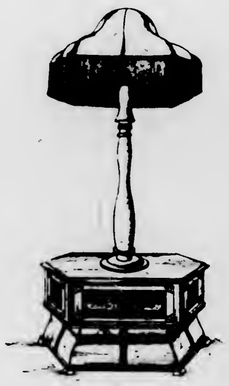


95,512
DESIGN FOR A SHOE
Nathan Kenneth Kean, New York, N. Y.
Application March 11, 1935, Serial No. 55,810
Term of patent 3½ years



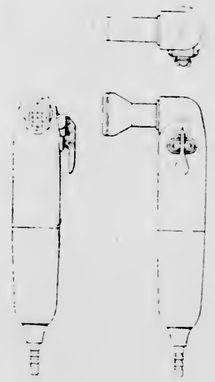
The ornamental design for a shoe as shown.

95,513
DESIGN FOR A DISPLAY CABINET
Frederick B. Keuthan, Indianapolis, Ind.
Application September 21, 1934, Serial No. 53,354
Term of patent 3½ years



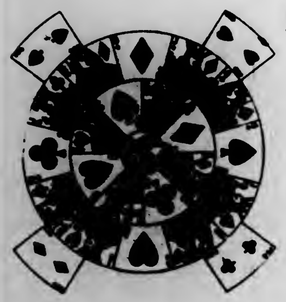
The ornamental design for a display cabinet, as shown and described.

95,514
DESIGN FOR AN ENSEMBLE DRESS
Jack Kirschner, New York, N. Y.
Application April 9, 1935, Serial No. 56,281
Term of patent 3½ years



The ornamental design for an ensemble dress, substantially as shown and described.

95,515
DESIGN FOR A PEDESTAL LAMP
John Kollwitz, North Tonawanda, N. Y.
Application February 19, 1935, Serial No. 55,491
Term of patent 7 years

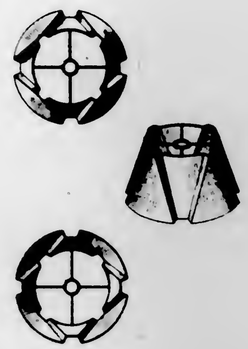


The ornamental design for a pedestal lamp, as shown.

95,516
DESIGN FOR A MASSAGE APPLICATOR
Anton Kretschan, Chicago, Ill.
Application April 28, 1934, Serial No. 51,580
Term of patent 7 years

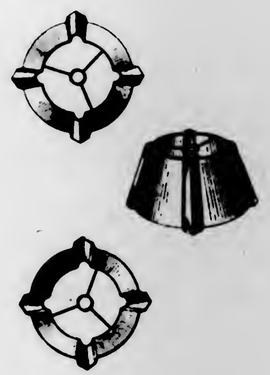
The ornamental design for a massage applicator, as shown.

95,517
DESIGN FOR A TARGET
Louis G. La Barie, Rochester, N. Y.
Application March 27, 1934, Serial No. 51,202
Term of patent 3½ years



The ornamental design for a target, as shown and described.

95,518
DESIGN FOR A LAMP SHADE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,531
Term of patent 3½ years



The ornamental design for a lamp shade, as shown.

95,519
DESIGN FOR A LAMP SHADE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,532
Term of patent 3½ years

The ornamental design for a lamp shade, as shown.

95,520
DESIGN FOR A LAMP SHADE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,533
Term of patent 3½ years

The ornamental design for a lamp shade, as shown.

95,521
DESIGN FOR A LAMP SHADE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,534
Term of patent 3½ years

The ornamental design for a lamp shade, as shown.

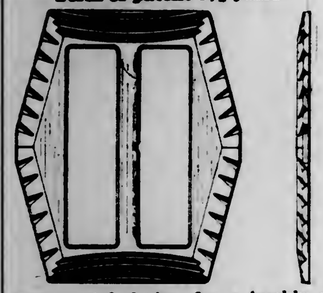
95,522
DESIGN FOR A LAMP BASE OR SIMILAR ARTICLE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,535
Term of patent 3½ years

The ornamental design for a lamp base or similar article, as shown.

95,523
DESIGN FOR A LAMP BASE OR SIMILAR ARTICLE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,536
Term of patent 3½ years

The ornamental design for a lamp base or similar article, as shown.

95,524
DESIGN FOR A LAMP BASE OR SIMILAR ARTICLE
Harry M. Laxer, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,537
Term of patent 3½ years



The ornamental design for a lamp base or similar article, as shown.

95,525
DESIGN FOR A LAMP BASE OR SIMILAR ARTICLE
Harry M. Lazar, New York, N. Y., assignor to Idealite, Inc., New York, N. Y., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,538
Term of patent 3½ years

The ornamental design for a lamp base or similar article, as shown.

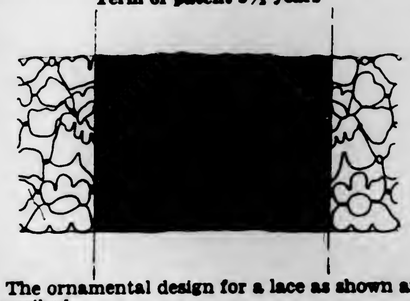
95,526
DESIGN FOR A BUCKLE SLIDE
Seymour J. Lesnik, Newark, N. J., assignor to American Record Corporation, New York, N. Y., a corporation of New York
Application March 7, 1935, Serial No. 55,772
Term of patent 3½ years

The ornamental design for a buckle slide, as shown.

95,527
DESIGN FOR A SHOE
David Levin, New York, N. Y.
Application March 18, 1935, Serial No. 55,915
Term of patent 3½ years

The ornamental design for a shoe, as shown.

95,528
DESIGN FOR A SHOE
Herman Lieber, Woodside, N. Y.
Application February 16, 1935, Serial No. 55,458
Term of patent 3½ years

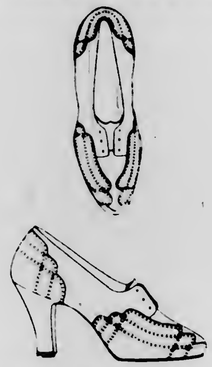


The ornamental design for a shoe, as shown.

95,529
DESIGN FOR A DOOR HANDLE
George D. Lindstrom and Edwin North, Rockford, Ill., assignors to National Lock Co., Rockford, Ill., a corporation of Illinois
Application March 1, 1935, Serial No. 55,666
Term of patent 3½ years

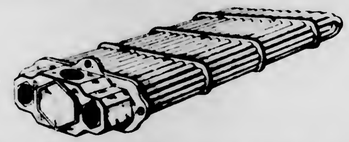
The ornamental design for a door handle as shown.

95,530
DESIGN FOR A LACE
Frederick Mackintosh, Bristol, R. I., assignor to Gehring Solomon & Birnbaum, Inc., New York, N. Y., a corporation of New York
Application February 28, 1935, Serial No. 55,659
Term of patent 3½ years



The ornamental design for a lace as shown and described.

95,531
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
John J. Maibach, New York, N. Y., assignor to Davis & Catterall, New York, N. Y.
Application March 13, 1935, Serial No. 55,865
Term of patent 3½ years



The ornamental design for a textile fabric or similar article as shown and described.

95,532
DESIGN FOR A SHOE
Charles Morali, Forest Hills, N. Y., assignor to Delman, Inc., New York, N. Y.
Application February 25, 1935, Serial No. 55,600
Term of patent 3½ years

The ornamental design for a shoe as shown.

95,533
DESIGN FOR A HEATING COIL
Virgil Willis Moray, New York, N. Y.
Application February 4, 1935, Serial No. 55,217
Term of patent 7 years

The ornamental design for a heating coil, as shown.

95,534
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application February 14, 1935, Serial No. 55,416
Term of patent 3½ years

The ornamental design for a shoe as shown.

95,535
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application February 14, 1935, Serial No. 55,417
Term of patent 3½ years

The ornamental design for a shoe as shown

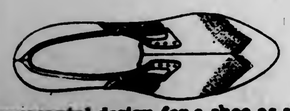
95,536
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application February 14, 1935, Serial No. 55,418
Term of patent 3½ years

The ornamental design for a shoe as shown.

95,537
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application February 26, 1935, Serial No. 55,506
Term of patent 3½ years

The ornamental design for a shoe as shown.

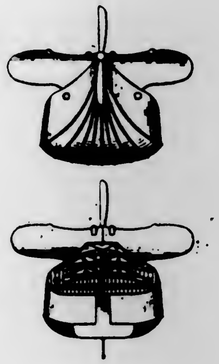
95,538
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application March 1, 1935, Serial No. 55,633
Term of patent 3½ years



The ornamental design for a shoe as shown.

95,539
DESIGN FOR A SHOE
Henry W. Nieman, Columbus, Ohio
Application March 1, 1935, Serial No. 55,634
Term of patent 3½ years

The ornamental design for a shoe as shown.

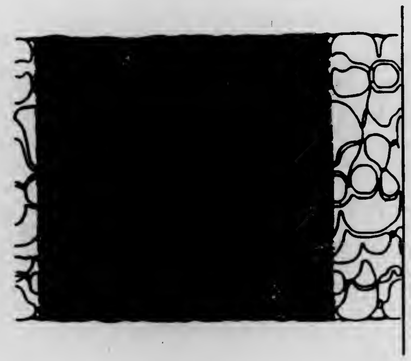


95,540
DESIGN FOR A SHOE
Andre Perugia, Paris, France
Application March 28, 1935, Serial No. 56,093
Term of patent 3½ years

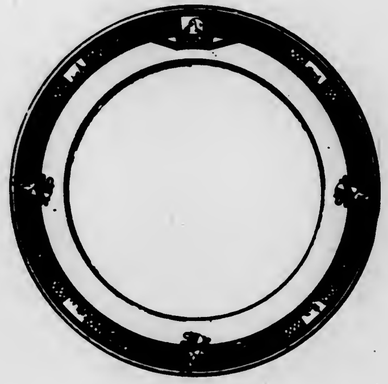
The ornamental design for a shoe, as shown.

95,541
DESIGN FOR A BOAT
Frank J. Piccola, Lynn, Mass.
Application January 11, 1935, Serial No. 54,820
Term of patent 7 years

The ornamental design for a boat as shown.

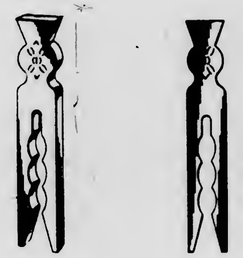


95,542
DESIGN FOR A SHOE
Flora Belle Polley, New York, N. Y.
Application March 20, 1935, Serial No. 55,961
Term of patent 3½ years



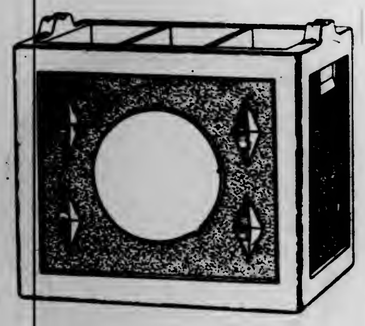
The ornamental design for a shoe, substantially as shown.

95,543
DESIGN FOR A LACE
William Priestley, Cranston, R. I., assignor to Gehring, Solomon & Birnbaum, Inc., New York, N. Y., a corporation of New York
Application February 28, 1935, Serial No. 55,658
Term of patent 3½ years



The ornamental design for a lace, as shown and described.

95,544
DESIGN FOR A PLATE OR SIMILAR ARTICLE
Henry Rampfel, Lakewood, N. J., assignor to Nathan Straus & Sons, Inc., New York, N. Y., a corporation of New York
Application January 25, 1935, Serial No. 55,047
Term of patent 7 years



The ornamental design for a plate or similar article, substantially as shown.

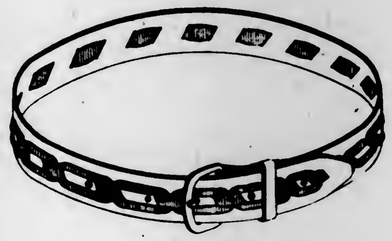
95,545
DESIGN FOR A CLOTHESPIN OR SIMILAR ARTICLE
Edwin Reynolds, Vineland, N. J.
Application February 6, 1935, Serial No. 55,268
Term of patent 14 years

The ornamental design for a clothespin or similar article, substantially as shown and described.

95,546
DESIGN FOR A STORAGE BATTERY CASE
Oliver G. Risser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application March 4, 1935, Serial No. 55,696
Term of patent 7 years

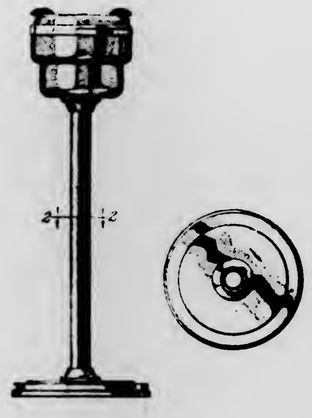
The ornamental design for a storage battery case, as shown and described.

95,547
DESIGN FOR A BOTTLE
Grace Chess Robinson, New York, N. Y., assignor to Mary Chess Inc., New York, N. Y., a corporation of New York
Application February 26, 1935, Serial No. 55,626
Term of patent 14 years



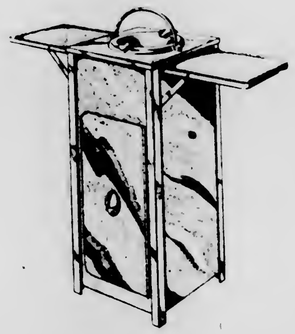
The ornamental design for a bottle, as shown.

95,548
DESIGN FOR A CHARACTER DOLL OR SIMILAR ARTICLE
Edward J. Rogers, Kansas City, Mo.
Application March 9, 1935, Serial No. 55,798
Term of patent 14 years



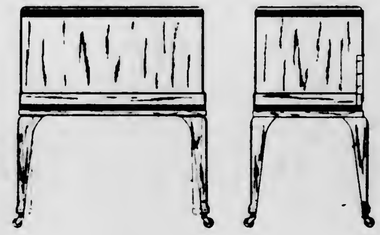
The ornamental design for a character doll or similar article, as shown.

95,549
DESIGN FOR A BELT FOR PERSONAL WEAR
Morris Sachs, Rochester, N. Y., assignor to Hickok Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application November 12, 1934, Serial No. 53,980
Term of patent 3½ years



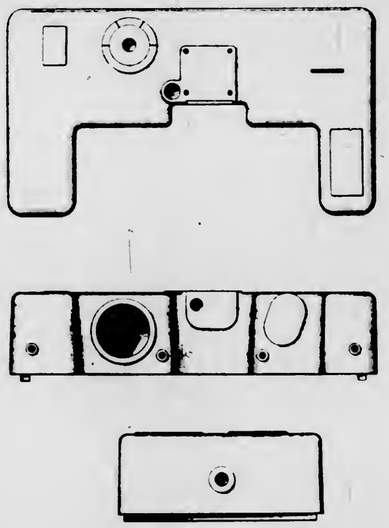
The ornamental design for a belt for personal wear, as shown and described.

95,550
DESIGN FOR A SMOKING STAND
Edward Schultz, Chicago, Ill., assignor to The Nagel-Chase Mfg. Co., Chicago, Ill., a corporation of Illinois
Application February 21, 1935, Serial No. 55,557
Term of patent 3½ years



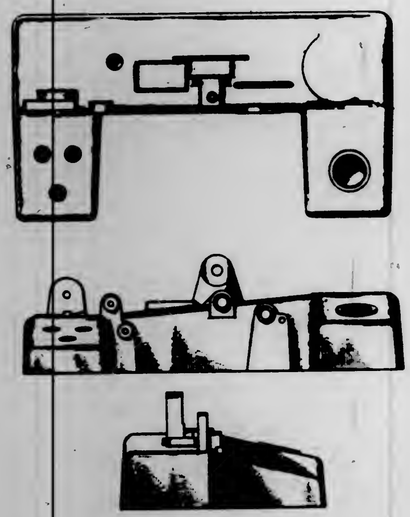
The ornamental design for a smoking stand, as shown.

95,551
DESIGN FOR A SMOKING STAND
Edward Schultz, Chicago, Ill., assignor to The Nagel-Chase Mfg. Co., Chicago, Ill., a corporation of Illinois
Application February 21, 1935, Serial No. 55,558
Term of patent 3½ years



The ornamental design for a smoking stand, as shown.

95,552
DESIGN FOR AN IRONING MACHINE CABINET
Herman A. Sperlich and Johannes H. Uhlig, Detroit, Mich.
Application January 30, 1935, Serial No. 55,157
Term of patent 7 years



The ornamental design for an ironing machine cabinet, substantially as shown and described.

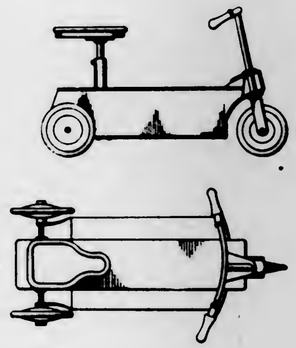
95,553
DESIGN FOR A PICTURE PROJECTING MACHINE BASE
Bruno Stechbart, Chicago, Ill., assignor to The Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application February 21, 1935, Serial No. 55,527
Term of patent 14 years

The ornamental design for a picture projecting machine base, as shown.

95,554
DESIGN FOR A PICTURE PROJECTING MACHINE BASE
Bruno Steinhart, Chicago, Ill., assignor to The Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application February 25, 1935, Serial No. 55,597
Term of patent 14 years

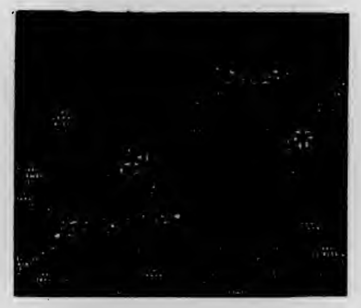
The ornamental design for a picture projecting machine base, as shown.

95,555
DESIGN FOR A BOTTLE
James S. Steelman, Millville, N. J., assignor to Whitall Tatum Company, Millville, N. J., a corporation of New Jersey
Application February 21, 1935, Serial No. 55,552
Term of patent 14 years



The ornamental design for a bottle as shown.

95,556
DESIGN FOR A BOTTLE
James S. Steelman, Millville, N. J., assignor to The Black Prince Distilleries, Inc., Nutley, N. J., a corporation of New Jersey
Application February 25, 1935, Serial No. 55,606
Term of patent 14 years



The ornamental design for a bottle as shown.

95,557
DESIGN FOR A CHILD'S WHEELED VEHICLE
James H. Stevenson, Los Angeles, Calif.
Application September 19, 1934, Serial No. 53,327
Term of patent 7 years

The ornamental design for a child's wheeled vehicle as shown.

95,558
DESIGN FOR LACE
Joseph A. Sutton, New York, N. Y.
Application March 13, 1935, Serial No. 55,862
Term of patent 3½ years

The ornamental design for lace, substantially as shown.

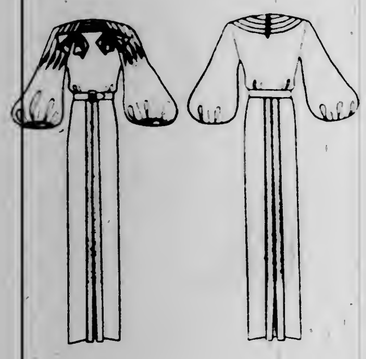
95,559
DESIGN FOR A BEVERAGE MIXER
Joseph M. Vogel, Adrian, Mich.
Application February 4, 1935, Serial No. 55,218
Term of patent 3½ years

The ornamental design for a beverage mixer, substantially as shown.

95,560
DESIGN FOR A SHOE
Harry E. Williams, St. Louis, Mo.
Application February 15, 1935, Serial No. 55,439
Term of patent 3½ years

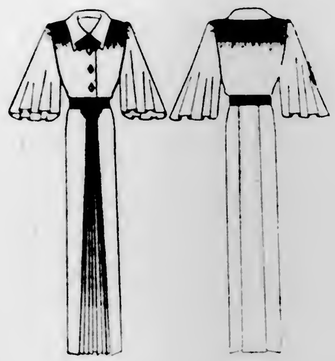
The ornamental design for a shoe, as shown.

95,561
DESIGN FOR A SHOE
Harry E. Williams, St. Louis, Mo.
Application February 15, 1935, Serial No. 55,441
Term of patent 3½ years



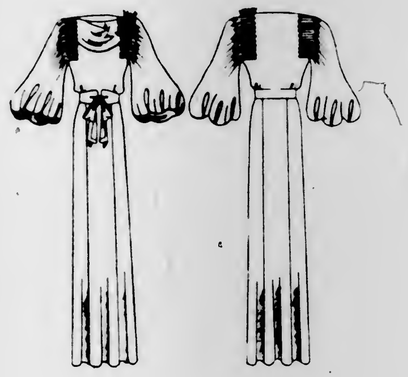
The ornamental design for a shoe, as shown.

95,562
DESIGN FOR AN INSTANTANEOUS WATER HEATER
Albin Youngholm, San Francisco, Calif.
Application March 5, 1935, Serial No. 55,732
Term of patent 14 years



The ornamental design for an instantaneous water heater, substantially as shown.

95,563
DESIGN FOR A DRESS
Samuel Zahn, New York, N. Y.
Application April 1, 1935, Serial No. 56,171
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

95,564
DESIGN FOR A DRESS
Samuel Zahn, New York, N. Y.
Application April 1, 1935, Serial No. 56,172
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

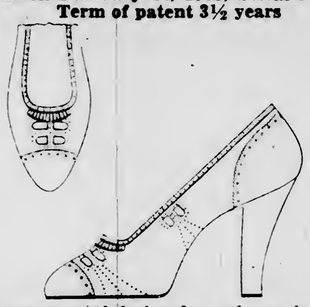
95,565
DESIGN FOR A DRESS
Samuel Zahn, New York, N. Y.
Application April 1, 1935, Serial No. 56,174
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

95,566
DESIGN FOR A DRESS
Samuel Zahn, New York, N. Y.
Application April 1, 1935, Serial No. 56,175
Term of patent 3½ years

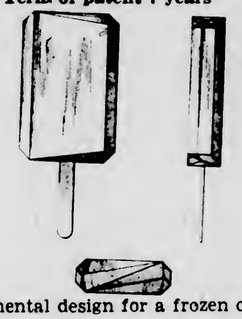
The ornamental design for a dress, substantially as shown and described.

95,567
DESIGN FOR A SHOE
Bogislavs Zegorav, New York, N. Y.
Application March 28, 1935, Serial No. 56,094
Term of patent 3½ years



The ornamental design for a shoe, as shown.

95,568
DESIGN FOR A SHOE
Bogislavs Zegorav, New York, N. Y.
Application March 28, 1935, Serial No. 56,095
Term of patent 3½ years



The ornamental design for a shoe, as shown.

95,569
DESIGN FOR A SHOE
Evelyn Ziniti, New York, N. Y., assignor to Scholnick Shoe Co., Jamaica Plain, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 55,421
Term of patent 3½ years

The ornamental design for a shoe substantially as shown and described.

95,570
DESIGN FOR A FROZEN CONFECTION
Harry W. Hahn, Los Angeles, Calif., assignor to Paul Hawkins Company, Los Angeles, Calif., a corporation of California
Application February 11, 1935, Serial No. 55,346
Term of patent 7 years

The ornamental design for a frozen confection as shown.

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office

Vol. 454—No. 2 TUESDAY, MAY 14, 1935 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Notice of Cancellation

U. S. PATENT OFFICE, *Washington, Apr. 18, 1935.*

Louis M. Furman, his assigns or legal representatives take notice:

An application for cancellation having been filed in this Office by The Manhattan Shirt Company, 444 Madison Avenue, New York, N. Y., to effect the cancellation of trade-mark registration of Louis M. Furman, 110 Bleeker Street, Brooklyn, N. Y., No. 156,799, dated July 11, 1922, and the notice of such proceeding sent by registered mail to the said Louis M. Furman at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Louis M. Furman, his assigns or legal representatives shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

RICHARD SPENCER,
First Assistant Commissioner.

U. S. PATENT OFFICE, *Washington, Apr. 20, 1935.*

Morris Pober, his assigns or legal representatives take notice:

An application for cancellation having been filed in in this Office by Henry J. Edwards, 61 Hanover Street, Boston, Massachusetts, to effect the cancellation of trade-mark registration of Morris Pober, 16 West 18th Street, New York, N. Y., No. 317,523, dated September 25, 1934, and the notice of such proceeding sent by registered mail to the said Morris Pober at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Morris Pober, his assigns or legal representatives shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

RICHARD SPENCER,
First Assistant Commissioner.

Trade-Mark Registrations Canceled

150,633. Insecticide. Vaycide Chemical Corporation, Birmingham, Ala. Registered January 3, 1922. Canceled April 26, 1935.

167,292. Toilet water. W. J. Bush & Co., Inc., New York, N. Y. Registered April 24, 1923. Canceled April 26, 1935.

167,293. Toilet water. W. J. Bush & Co., Inc., New York, N. Y. Registered April 24, 1923. Canceled April 26, 1935.

250,012. Skin cream. Godefroy Manufacturing Company, St. Louis, Mo. Registered November 27, 1928. Canceled April 26, 1935.

269,353. Certain listed surgical and medical instruments and supplies. Actien-Gesellschaft für Feinmechanik, vormals Jetter & Scheerer, Tuttlingen, Germany. Registered April 1, 1930. Canceled April 16, 1935.

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE LOWRY

No. 3,362. Decided January 7, 1935

PATENTABILITY—ALLOY OF NICKEL-COBALT BASE—INDEFINITENESS.

Certain claims for an alloy of a nickel-cobalt base *Held* unpatentable on the ground of indefiniteness.

APPEAL from the Patent Office. Affirmed.

Mr. O. H. Eschholz and *Mr. J. Howard Flint* for Lowry.

Mr. T. A. Hostetler and *Mr. Howard S. Miller* for the Commissioner of Patents.

GRAHAM, *P. J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office, rejecting claims 34, 35, and 36 of appellant's application for a patent upon a claimed new alloy, comprising nickel, cobalt, iron, titanium, and the like.

Said claims are as follows:

34. An improved allow of nickel-cobalt base having high mechanical, electrical and oxidation resistance consisting of nickel in minimum amount of about 3.5% and cobalt in minimum amount of about 3.5%, the sum of nickel and cobalt ranging from about 70% to 95%, and the balance being approximately 30% to 5% iron plus metal selected from a group consisting of vanadium, molybdenum, manganese, tungsten and titanium, the selected metal being about 10% to 1% of the total alloy.

35. An improved allow of nickel-cobalt base having high mechanical, electrical and oxidation resistance, consisting of nickel in minimum amount of about 3.5% and cobalt in a minimum amount of about 3.5% the sum of nickel and cobalt ranging from about 70% to 95%, and about 1% to 10% titanium, and the balance primarily iron.

36. An improved alloy of nickel-cobalt base having high mechanical, electrical and oxidation resistance consisting of cobalt in minimum amount of about 5% and nickel present in excess of the cobalt, the sum of nickel and cobalt ranging from about 70 to 95%, and the balance approximately about 30 to 5% iron plus metal selected from a group consisting of vanadium, molybdenum, manganese, tungsten, and titanium, the selected metal being about 4% to 1% of the total alloy.

These claims were rejected by the Examiner on indefiniteness and on certain references. The Board of Appeals affirmed this decision, on all grounds. Other claims, more definite and specific, were allowed.

The appellant offered in support of his application in the Office the affidavits of Percy G. McVetty and Porter H. Brace, each of whom was entirely qualified to speak on the subject of alloys, and each of whom had conducted experiments relative to alloys comprising nickel and cobalt and the other elements mentioned by appellant in his specification.

The Examiner was of opinion that the metals, cobalt and nickel, as used in this application, were used as, and were, equivalents. The affidavit of McVetty took issue with this, and said, *inter alia:*

Deponent states that he has conducted tests and measurements of this alloy in comparison with other alloys, and as a result he is clearly of the opinion that the alleged equivalency does not exist in this alloy but that the alloy is a new metal system to which nickel and cobalt contribute their own peculiar and non-interchangeable factors. • • •

Brace expresses a similar view in his affidavit. Each expresses the further view that, as the proportions of these metals which enter into the alloys are changed, the character of the alloy radically changes, especially as to hot tensile strength. After a careful reading of these affidavits, it is impossible to escape the conviction that, on this record, nickel and cobalt cannot be considered as equivalents.

Claims 34 and 35 represent a range of cobalt from 3.5 per centum to 91.5 per centum, and of nickel from 3.5 per centum to 91.5 per centum. Claim 36 provides, as its proportions, a minimum amount of 5 per centum cobalt, and nickel present "in excess of the cobalt."

If we accept the appellant's contentions of non-equivalency, there seems to be no escape from the conclusion of the Board of Appeals:

• • • If, on the other hand, as strenuously urged by appellant, they are not equivalent, then it is very clear that these claims cover alloys of very different character and the range is of such wide scope that the claims should not be allowed because of their indefiniteness, and as covering two alloys of different characteristics.

We are of opinion that the Board properly rejected claims 34, 35, and 36 on the ground of indefiniteness. In so doing, it was within the doctrine announced by us in several cases. *In re Gray et al.*, 19 C. C. P. A. (Patents) 745, 53 F.(2d) 520; *In re Richter*, 19 C. C. P. A. (Patents) 756, 53 F. (2d) 525.

The appellant argues that he has shown invention in his "high-cobalt range." The difficulty with this position is that his rejected claims are not so limited, and we may not read limitations into them. *In re Krichbaum*, 17 C. C. P. A. (Patents) 979, 39 F.(2d) 280; *In re Stern*, 17 C. C. P. A. (Patents) 1234, 40 F.(2d) 1000.

In view of our conclusions above stated, we find it unnecessary to discuss the other grounds of rejection.

The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE BUTTOLPH

No. 3,116. Decided December 24, 1934

1. PATENTABILITY—DISCHARGE TUBE FOR POSITIVE COLUMN LIGHT—RIGHT TO MAKE THE CLAIMS.

Claims for a discharge tube for positive column light *Held* unpatentable to the applicant since the application does not describe a positive column light and the disclosure is not such that "positive column light" is inherent therein.

2. PATENTS—APPEAL—ASSIGNMENTS OF ERROR.

An assignment that the Board of Appeals erred in not allowing certain claims and erred in rejecting certain claims as not sufficiently distinguishing over the references *Held* insufficient to require consideration of the correctness of the action of the Board of Appeals.

APPEAL from the Patent Office. Affirmed.

Mr. Frederick Transem, Mr. Thos. H. Brown, Mr. Lee B. Kemon and *Mr. Raphael Tourover* for Buttolph.

Mr. T. A. Hostetler and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office, which affirmed the action of the Examiner in his rejection of claims 4, 5, 6, 10, 12, 13, 15, 21, 22, 23, 24, 25, 28, 29, 30, and 31 of appellant's application for patent for an alleged invention relating to vapor arc lamps. Claims 11, 26, and 27, rejected by the Examiner, were allowed by the Board. Other claims were allowed by the Examiner.

Claims 22, 23, and 24 were copied into appellant's application from a patent to Hertz, No. 1,726,107 of August 27, 1929, for the purpose of interference, which claims read as follows:

22. A discharge tube for positive column light, the gaseous filling of which comprises argon and mercury vapor.
23. A discharge tube for positive column light, the gaseous filling of which consists of argon, krypton, xenon and mercury vapor.
24. A discharge tube for positive column light, the gaseous filling of which consists of argon having a pressure above 4 millimeters of mercury pressure and of mercury vapor.

These claims were rejected by both tribunals below as unpatentable to the applicant for want of disclosure in applicant's application as filed. Since the chief contention in this appeal involves the correctness of the Board's ruling as to these three claims, we will consider them at this point without any reference to any of the other claims in the application which are hereinafter discussed.

It will be noticed that each of the three claims calls for a discharge tube for *positive column light*. The first two claims differ slightly in the gaseous filling in the tube. Claim 24 calls for "argon having a pressure above 4 millimeters of mercury pressure and of mercury vapor."

The Examiner and the Board both held that appellant did not disclose a positive column light and that the application as originally filed made no mention of pressure.

Appellant contends here that the phrase "positive column light" is introductory and that the positive column light characteristic is inherent in the kind of tube he disclosed in his application, and that he was not required to disclose matters which were within the knowledge of those skilled in the art in order that he be entitled to make a claim, for interference purposes, containing such an introductory phrase. Appellant submitted several affidavits by different scientific men skilled in the particular art involved, in an effort to show that a positive column light was inherent in appellant's structure.

The Examiner discussed the "positive column light" phase of the case at great length, but the substance of his holding is to the effect that claims 22, 23, and 24 were new matter over applicant's specification, since he did not disclose in his specification that the gas pressure, the current, the length of the discharge tube and the shape of the discharge tube are selected so as to produce positive column light. The Examiner conceded that applicant's device may have a luminous column and not have a positive column, since the light may be due to a negative glow. The Examiner said:

> • • • It does not necessarily follow from what applicant has disclosed that applicant's device is a positive column device. As pointed out in the decision of *Steenstrup* v. *Morton* 382 O. G. 571 "when an applicant attempts to copy claims from an existing patent, it is incumbent upon him to show clearly in his specification and structure, the means for accomplishing the object called for in the claims". It is not believed that the claims should be broadened in scope in view of the broadening of the definition of the term positive column by subsequent developments in the art. It has not been clearly shown by reference to a publication or a patent which has a published date prior to the filing date of the Hertz patent, from which claims 22 to 24 were copied, that has an arc discharge having a positive column, except by the patent to Hewitt, 1,156,227, which is not very clear or authoritative. At the time the patent to Hertz was pending as an application, the expression "positive column lamp" was used to mean a "glow discharge lamp having a positive column".
>
> If the claims are to be given the broad meaning which applicant has assigned to them, they are considered to be unpatentable over the disclosure of the patent to Hewitt 814,095 or the Austrian patent 40,817.

What appellant did disclose is, we think, concisely set out by the Examiner in his decision:

> The applicant discloses an electric arc lamp and a circuit for supplying electrical energy to the lamp. The lamp comprises a tube of vitreous material having filaments sealed into the ends thereof. A material giving off electrons, as calcium, may either be mounted on one of the filament supports or on a short pedestal near the filament. A globule of mercury or similar vaporizable material, as cadmium or lithium iodid, is placed in the envelope near one of the electrodes and is vaporized by the heat of the electrode thereby furnishing a vapor atmosphere for the lamp. Other gases such as hydrogen, helium, neon, argon, krypton, xenon, oxygen, or vaporizable materials as cadmium, zinc, sodium, potassium, lithium, caesium, and iodine or a mixture of any two or more of them, may be used in the envelope to furnish the atmosphere for the lamp. The filamentary electrodes are made of tungsten, carbon, tantalum, osmium alone, or with conductors of the second class. The circuit for the lamp comprises a source of alternating current connected to the primary of a transformer through [a] switch and to the electrodes by means of leads. The transformer secondaries are connected to the filaments so that when current is induced in each secondary, current will flow through the filaments. A solenoid is connected in the main supply circuit and in operable relation to [the] switch. In the lamp starting position the switch is in the closed position to allow the transformer to be energized. The transformer being energized, current flows from the secondaries to the filament electrodes, respectively, thereby instituting electron flow from the filaments through the discharge space and initiating a path for the flow of the main supply current through the lamp. Upon the flow of the main current through the lamp, the solenoid is actuated and opens [the] switch and holds it open, thereby deenergizing the secondary of the transformer. The filaments consequently are no longer heated by the passage of current through them, but are maintained at an electron emitting temperature by the heat generated in them due to the discharge in the lamp. [Reference to figures of drawings deleted.]

BLAND, *J.*:

In defining a positive column light, the Examiner said:

> • • • The positive column is defined as the space between the Faraday dark space and the anode of the discharge device in those discharge devices wherein the various spaces are distinguishable. • • • Positive column lamps are commonly considered to be glow discharge lamps, and applicant has not shown that all arc lamps which have a luminous column have a positive column.

The Board of Appeals, in affirming the Examiner in rejecting said claims 22, 23, and 24, points out that the Hertz patent refers specifically to a discharge tube for positive column light, and in concluding that there was a lack of disclosure of this feature in applicant's application, the Board said:

> • • • The original specification is wholly silent on the matter. There is nothing said about gas pressures in the specification or current densities used for the discharge. The tube shown is long and this favors the supposition that positive column light may be inherent. After examining the authorities cited, however, we are not satisfied that positive column light is inherent in appellant's disclosure. During the prosecution of the case, and in certain affidavits filed both during the prosecution and with the appeal, an attempt has been made to show that appellant's improvement relates to lamps which in general have the positive column characteristic. It is of course immaterial, if the disclosure as originally presented does not inherently involve positive column light, that this is the type of light appellant may have intended to produce. Evidence wholly extraneous to the application cannot be relied upon to show this fact. Such, in effect, is the nature of the evidence presented by the affidavits.

We agree with the Board and the Examiner that the term " for positive column light" is a limitation in said claims not disclosed in appellant's application as filed. In the case of *Braren* v. *Horner*, 18 C. C. P. A. (Patents) 971, 47 F.(2d) 358, this court passed upon the question as to whether or not the term "In an engraving machine and the like" was only introductory or was to be considered a limitation in the claims. After discussing the authorities, we said:

> These cases, we are of opinion, are in point here and are sufficient authority, in view of the facts disclosed by this record, to justify the conclusion that the words, "in an engraving machine and the like," as used in the counts in issue here, are introductory only, and should not be considered as limitations of the subject matter of the issue. It is true, as stated by the Examiner of Interferences, that in some cases courts have held that similar introductory words should be considered as limitations. *However, we think it may be safely said that in all such cases an examination of the facts disclosed by the record will show that the words thus considered as limitations, were an essential element in the novelty of the device and of the invention in issue there.* No such contention is properly made here, as it is obvious that if there be invention, it is not in the construction of an engraving or similar machine, but in the drive by which such machine is operated. [Italics not quoted.]

In the instant case, it seems not to be disputed that the novelty relied upon by appellant and by Hertz is in the use of said gases in a *positive column light*. As is pointed out above, the Examiner held that if the claims were construed as is contended for by appellant, that is to say, that if the positive column light is not to be regarded as a limitation on the claims, the claims would read on the prior art, and the patent to Hertz would be invalid. Hertz discloses and claims a construction which involves the use of a gas or gasses and pressure which makes a positive column light. If the teachings of Hertz are followed, a positive column light must result. We do not think this is true in the teachings of appellant. As was suggested in *Braren* v. *Horner*, supra, we think the phrase "for positive column light" is "an essential element in the novelty of the device."

The effect of our holding in *Braren* v. *Horner*, supra, was discussed by this court in *Hall* v. *Shimadzu*, 19 C. C. P. A. (Patents) 1288, 59 F.(2d) 225. Certain counts contained the phrase "a process of manufacturing a fine powder of lead suboxide intermingled with powder of metallic lead." Concerning the same, the court said:

> With reference to the counts here in issue, we think that the phrase here under consideration is more than merely an introductory phrase and is absolutely essential to point out the invention that is here involved.

[1] Whether the phrase "for positive column light" may be relied upon to lend patentability to the claims of the Hertz patent is not a matter for our consideration here. It is a limitation in the claim, is obviously relied upon for novelty, and we think that the Patent Office tribunals were correct in holding that appellant could make the claims involved only by showing that he disclosed this limitation in his application, and were correct in rejecting such claims when presented in appellant's application.

[2] Appellant in his brief here has not discussed the particular features of claims 4, 5, 6, 10, 12, 13, 15, 21, 25, 28, 29, 30, and 31, which were held to present no inventive novelty over the prior art cited. The references referred to in appellant's brief are discussed with a view of showing their bearing on the action of the Board in rejecting said claims 22, 23, and 24. Appellant, however, has assigned the following errors Nos. 3 and 4:

3. In rejecting certain other of the claims as not sufficiently distinguishing over certain cited references.
4. In not allowing all the claims in substance as presented.

Under the circumstances of this case, we think the above assignments of error do not require our consideration of the correctness of the action of the Board of Appeals in affirming the Examiner in his rejection of said claims. We think that our ruling in this particular is justified in view of the fact that appellant has not briefed nor discussed the references nor pointed out the particulars in which he regards the references as not being anticipatory of the claims.

No error on the part of the Board in its decision appealed from having been pointed out, its decision should be and is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

ALTORFER AND DEHLE *v.* HAAG

Nos. 3,317 and 3,318. Decided December 24, 1934

INTERFERENCE—PRIORITY—REDUCTION TO PRACTICE—CONCEALMENT AND SUPPRESSION.

Record reviewed and *Held* to establish that H., who was the first to conceive the invention, was also the first to reduce it to practice, had not concealed or suppressed the invention and was entitled to the award of priority.

APPEAL from the Patent Office. Reversed.

Mr. Joseph H. Milans and *Messrs. La Porte & La Porte* for Altorfer.

Mr. Norman B. Frost and *Mr. M. Theodore Simmons* for Dehle.

Mr. George L. Chindahl and *Mr. C. Paul Parker* for Haag.

BLAND, *J.*:

This is a three-party interference proceeding in which Altorfer, as one of the defeated parties in the United States Patent Office, and Dehle as the other, have appealed from the decision of the Board of Appeals which awarded priority in the seven counts of the interference involved to appellee Haag.

The counts relate to an improvement in a washing machine of the type which has in the central portion of the tub an upstanding tubular column, which comes through the bottom of the tub and in watertight engagement therewith. Through the tubular column is a vertical drive shaft extending to the top of the column. At the top of the column a water agitator, technically styled a "dolly", of the inverted or submerged type, is fastened. The dolly extends to the bottom of the tub and is so positioned as to have the lower part of the dolly beneath the water and the articles to be washed.

It was found that the articles in the tub which were being washed would get between the lower

part of the dolly and the tub. This was overcome by making the dolly smaller than the tub and surrounding the lower edge of the dolly with a ring, the ring thus placed permitting the dolly to extend down into the tub so as to keep the clothes from coming into contact with the bottom part of the dolly. With the ring we are not concerned here, except as facts relating to it, shown in the record, may throw light upon inquiries which are pertinent to the issues here involved. The subject matter of the ring is involved in companion interference No. 56,454, *Altorfer* v. *Haag*, 22 C. C. P. A. (Patents) ——, ——F.(2d)——(patent appeal No. 3,349), decided concurrently herewith.

The Examiner of Interferences and the Board of Appeals gave Altorfer a date of not later than the spring of 1921 as the date of conception. The Examiner of Interferences held that the work of Altorfer in the spring of 1921 also amounted to a reduction to practice of the issues involved.

The Board held that Haag did not conceive until the fall of 1923, and Dehle in the fall of 1924. The Examiner of Interferences held that since Altorfer conceived and reduced the invention to practice before either of the other parties had conceived the same, he was the first inventor and was entitled to an award of priority in the invention in all the counts involved.

Altorfer filed his application for a patent on the washing machine which embodied the invention of the counts at bar on May 21, 1925. On November 21, 1927, Altorfer copied claims 14, 15, 16, 17, and 18 of a patent to Haag, Reissue No. 16,746. On February 27, 1928, the Examiner declared an interference with claim 17 (count 1 at bar) as the subject. Claims 14, 15, 16, and 18 are counts 1, 2, 3, and 4 of the companion interference. Counts 2 to 7, inclusive, of the present interference (being claims 10, 11, 12, 14, 15, and 18 of the Haag reissue patent) were added by the Examiner for the purposes of interference on February 21, 1930, "pursuant to the decision of the Law Examiner dated July 24, 1929", which latter decision does not appear in the record. Haag filed July 25, 1924, and Dehle filed September 6, 1924. Haag's patent was reissued on September 27, 1927, application for which reissue was filed on February 19, 1927. Dehle's reissue application was filed May 6, 1926. As indicated above, there are seven counts in the instant interference, of which count 1 is illustrative and follows:

1. In a washing machine, a tub, having an opening centrally disposed in the bottom thereof, a vertical drive shaft projecting through said opening to a point above the normal water level in the tub and adjacent to the top thereof, means for sealing said opening, and means for agitating the contents of the tub, said agitating means comprising a disk-like member arranged adjacent to the bottom of the tub and having the periphery thereof spaced a substantial distance from the wall of the tub, a central sleeve projecting upwardly from said disk to a point adjacent the upper end of the drive shaft, means for positively connecting the upper end of said sleeve with the drive shaft whereby the agitating means is driven from said shaft.

Throughout the proceeding it was urged that in view of Altorfer's long delay in getting into the Patent Office (over four years from the date of conception) and in view of his conduct during that period and subsequent to his filing date, he should be estopped from claiming the counts; that if he had completed his invention as claimed he suppressed and concealed it and only came forward with it after being spurred into activity by knowledge of the activities of Haag, relying on the case of *Mason* v. *Hepburn*, 13 App. D. C. 86. It was further contended that if the rule in *Mason* v. *Hepburn*, supra, did not apply, the facts indicated that instead of what Altorfer did in 1921 amounting to a reduction to practice, it should be regarded as showing only an abandoned experiment.

The Examiner of Interferences held that there was a complete reduction to practice in 1921 by Altorfer, and that there was no such concealment, suppression or abandonment as to warrant application of the doctrine of *Mason* v. *Hepburn*, supra.

The Board of Appeals regarded certain tests made in 1921 by Altorfer as unsatisfactory and said—

> We believe considerable uncertainty arises here as to whether this constitutes a reduction to practice * * *.

The Board, in awarding priority to Haag, seemed to be influenced largely by the fact that the wooden dolly, Altorfer's Exhibit 8, made and used by Altorfer in 1921, was—

> maintained in secrecy, locked in a vault or store room

and stated that if Altorfer's 1921 activities amounted to a reduction to practice, the case fell within the said *Mason* v. *Hepburn* doctrine. The Board stated:

> We, however, prefer the first view as to this situation.

The first view expressed was that Altorfer's work in 1921 did not amount to a reduction to practice, and that Altorfer was not diligent until he finally reduced the invention to practice subsequent to Haag's filing date.

After very careful consideration of the record, we are convinced that Altorfer conceived and reduced to practice the invention expressed by the counts involved as early as the spring of 1921, which was before either of the other parties entered the field. We think the facts of record do not warrant the conclusion either that Altorfer was guilty of such conduct as made the doctrine of *Mason* v. *Hepburn*, supra, applicable or that the facts as a whole justify the conclusion that what he did in 1921 amounted to only an abandoned experiment. The record is a voluminous one and much of it is devoted to happenings in the year 1921 or subsequent happenings which throw light upon Altorfer's 1921 activity. The facts are not involved or uncertain, but, owing to the importance of the issue, we think a rather full statement of such facts as relate to Altorfer's reduction to practice and subsequent conduct, are here required. Our conclusions obviate the necessity of a discussion of the activities of either Haag or Dehle.

Altorfer's company, Altorfer Brothers Company, was a manufacturer of washing machines in East Peoria, Illinois. Haag's company, Haag Brothers Company, a competing concern, was also located at

the same place. Altorfer Brothers Company manufactured and sold more than one kind of washing machine, it being shown that it was their policy to furnish the kind of machine the trade required; that among such machines sold was the "Alco" washer, in which was a "floating" dolly which rested on top of the clothes and which was driven from the top of the shaft that projected from the bottom of the tub, the driving mechanism being beneath the tub. The improvement involved in this interference, as before stated, relates to the substitution of a submerged dolly for the floating dolly.

It is of record that in 1920 Altorfer Brothers Company felt required to make some improvement over the "Alco" machine with a view of meeting competition, and that the idea involved in the counts at bar was then under consideration, and the first so-called submerged dolly was built. In view of later activities, it is not necessary to consider the 1920 dolly. It is not disputed, and we thing the record clearly shows, that in the spring of 1921, Altorfer's Exhibit 8, which is before us, a wooden dolly of the submerged type, with a wooden ring surrounding the bottom of the same, was constructed and tested in the Altorfer Brothers Company plant in an "Alco" machine. It is conceded that Exhibit 8, together with Altorfer's Exhibit 1, an "Alco" machine, meet fully the requirements of the counts involved. Haag does not question that Altorfer's Exhibit 8 was constructed and experimented with in 1921, but Haag does contend that it was not sufficiently tested as to amount to a reduction to practice.

In the spring of 1921, Altorfer ordered one Schellenberg to make a wooden dolly that would comprise a round disk with a conical center. One Vance made the dolly and the ring under Schellenberg's direction. Altorfer at that time was vice-president of Altorfer Brothers Company, while Schellenberg was employed by that company as an experimental and developing engineer. At the time of giving testimony, however, he was an engineer with the Federal Electric Company of Chicago. Vance worked for Altorfer Brothers Company as a pattern-maker in 1921, and at the time of giving testimony was superintendent of school buildings in the city of Peoria. The making of the dolly and the ring is clearly shown by said three witnesses. The dolly so made was of wood, conical in shape, with four equally spaced paddles. The paddles or wings did not extend upward to the top of the tubular column centrally located. The feature of having the paddles or wings extend upward on the post was a later development with which we are not here concerned. Altorfer and Schellenberg testified that the dolly was tried in an "Alco" washing machine. "Alco" machines were manufactured before, during and after 1921 by the Altorfer Brothers Company, and were being manufactured and sold by them at the time of taking of testimony in 1930. The original dolly made in 1921 is in evidence. The original wooden ring was broken in use and others were made in 1921 and 1922. The original "Alco" machine in which the dolly was used, according to the record, was damaged and lost, but as a prototype Altorfer produced, as Exhibit 1, another "Alco" machine in which the dolly and ring are placed in operable position. With this machine are two adjuncts, both of the floating dolly type, one known as the "rubboard" dolly and the other known as the "peg" dolly. An additional sleeve goes with the machine for the optional use of these two dollies.

Altorfer testified that in 1921 he put the dolly in the said "Alco" machine, and operated the machine and "watched the water action", and "put clothes in and watched the clothes action"; that this was done "a number of times over a period of several months"; that he watched the results when a few pieces of cloth were used and when a full load of six pounds was used; that he noticed that the water had more agitation and that the machine would wash faster than the "Alco" machine, and that it washed the clothes clean; and that it showed that the machine would work to the users' entire satisfaction, if put on the market.

Schellenberg corroborated the testimony of Altorfer, and went into more detail, showing that the machine was tested with water, soap and clothes, that the machine gave a "wonderful" water demonstration, and that the results were "exceptionally good" in the cleansing of materials; that they put rags and overalls in the tub; that the guard ring successfully kept the clothes from getting under the edge of the dolly, and that thereafter the operations were carried on several times in making comparison tests with the cylinder type machine and the oscillator type machine, which machines were both being marketed by Altorfer Brothers Company in 1921. Schellenberg said that he tested the machine by the use of a handkerchief or tie and on up to "four to six pounds, sometimes over" of materials which were weighed by him; that several guard rings had to be made because in leaving the guard rings in the water over night they would swell and the rings would get "out of round".

The evidence shows that between the years 1921 and 1923 the machine was tested frequently in comparative tests, that is, to compare its action and results with those of other machines such as the vacuum cup machine and the "Snowdrift" machine. The submerged dolly was frequently demonstrated in 1922, 1923, and 1924. These tests were made with a view of ascertaining the best manner of manufacturing the dollies for the trade, that is to say, whether the dollies should be of wood, metal, part wood or part metal. It was also desirable to ascertain what number of blades or paddles would give the best results. Tests and demonstrations were also made in order to ascertain if fins or small blades might not be added to the upper portion of the dolly as were added to a "Double-A" machine, which was a later development of machine but which is not involved in the issues of this interference. Since Altorfer was the manufacturer and seller of several different kinds of machine, it seems

obvious from the facts shown in the record that trade considerations, competition, cost of manufacture and many other related matters were under consideration. During these tests it was not the purpose of Altorfer to supplant the "Alco" machine on the market. In fact the new machine never did supplant the "Alco" machine, which was still being sold by Altorfer Brothers Company at the time of taking the testimony. The tests referred to included the use of square tubs and copper tubs with dollies of the submerged type, the square tub being made and tested in the fall of 1923.

The witness MacDonald, who was an experimental mechanic and engineer in the Altorfer Brothers Company plant in 1921, testified to the existence of the 1921 dolly when he entered the employ of Altorfer Brothers Company in 1922, and that he repaired the wooden dolly sometime in the summer of 1923 by replacing the bearing plate on the bottom of the dolly, because the former plate was "cutting into the center post" on which it was bearing. This fact, we think, shows extensive use of the dolly. MacDonald testified as to using the dolly in making efficiency tests for washing action between the spring of 1923 and the fall of that year and stated that said tests were made in conjunction with the wooden guard ring. Some of the tests made with the 1921 dolly were made by running the machine "day and night until the clothes sometimes became a pulp", but the record shows that there was no damage to the clothes during a normal washing period and no damage to the dolly. In the fall of 1923 and the spring of 1924, according to MacDonald, work was done on certain sheet metal dollies with metal and wooden rings; that the dollies were operated, and "very good" washing results were obtained.

Altorfer testified that on the completion of the 1921 wooden dolly he operated the machine with clothes; he later explained that their testings customarily were made with dirty overalls, and that the overalls were cut in half, testing first one half and then the other for comparison; that soiled overalls of men working in the plant were used.

It is shown by the record that at such times when the dolly was not in use in experimentation it was kept in the vaults of the company; that the experimentations were made openly in the plant of the company. In August, 1924, prior to any knowledge Altorfer could have had of the Haag machine, as is hereinafter referred to, Altorfer showed a machine involving the invention in issue to William B. Henri, member of an advertising firm, with the idea of running a test advertising campaign. Henri selected the "Snowdrift" machine to make the test with "because it looked to us to be the most spectacular machine to advertise". Henri was somewhat indefinite as to the particular kind of machine he saw, but indicates a belief that it was a machine involving the issue here involved.

Schellenberg states that on February 13, 1925, he completed the "Double-A" machine which was substantially like a machine that went into production in May, 1925. In this machine the agitator had four wings.

It is stated in the record that the time required to get a machine into commercial production was about five or six months. The dolly used in the machine which was finally produced by Altorfer had supplemental vanes along the central post, which gave additional clothes action, which subject matter is not involved in this interference. These vanes were added in the winter of 1924 or spring of 1925. There were other witnesses who testified to certain activities occurring during the years 1924 and 1925. This testimony may have some bearing upon the question of continued activity on the part of Altorfer, but is not of sufficient importance to necessitate a recital of it here.

Haag contends here that there was no sufficient test made by Altorfer prior to Haag's entering the field which would demonstrate the completion of the invention, and argues that it was necessary in the testing of a washing machine to test it on a wash such as would be made in the household; that it was not sufficient to test it upon a small amount of clothes or one particular kind of clothes; that a shop test is not sufficient; and that the conduct of Altorfer after making the wooden dolly in 1921 indicates that he was not satisfied with it and had not become convinced that it worked satisfactorily. Haag argues also that the fact that Altorfer did not file his application until after he became aware of the fact that Haag had placed a machine embodying his invention on the market, and did not claim the invention for the purpose of interference until November 21, 1927, after Haag had repeatedly notified Altorfer to refrain from infringing his patent, and sought a lease for manufacturing under the Haag patent, shows that Altorfer did not regard himself as the first inventor.

It affirmatively appears in the record that Altorfer, subsequent to filing his application on May 21, 1925, indicated a willingness to operate under a free license from Haag. It is obvious that the record does not disclose all the circumstances relating to this subject matter.

The mere fact that one party to an interference indicates a willingness to operate under a free license from the other does not, of itself, show that the party seeking such license does not regard himself as the first inventor, or that he, in fact, had not completely reduced his invention to practice. In cases where the question of reduction to practice is a close one, this kind of circumstance may be, and often is, taken into consideration in arriving at a conclusion as to whether or not there was an actual reduction to practice. But, where the record is clear, as in the case at bar, that there was an actual reduction to practice, such a circumstance does not require a holding that there was no reduction to practice. *Osgood* v. *Ridderstrom*, 21 C. C. P. A. (Patents) 1176, 71 F.(2d) 191.

We are of the opinion that the record shows that Altorfer had fully reduced his invention to practice by the spring of 1921, or in any event had done so before Haag had entered the field, and that the record does not disclose facts which indicate that Altorfer abandoned his invention, or that he ever suppressed or concealed the same in such a way as to make applicable the doctrine in the case of *Mason* v. *Hepburn*, supra. Altorer's long delay in filing his application after the reduction to practice and his acts subsequent to his reduction to practice do not indicate any intention to abandon the invention, but, on the contrary, his subsequent acts indicate an intention to utilize and commercialize the invention at a date dependent upon the result of tests and upon other considerations which we think were wholly reasonable and proper under the circumstances for him to take into consideration.

As to the contention of Haag that he was spurred into activity, Altorfer replies in substance that if he was spurred, he was not spurred to any great extent, since he did not file his application until May, 1925, after seeing the Haag machine in February, 1925, and after Schellenberg had seen the Haag machine in the fall of 1924, and he did not claim, for interference purposes, the issue of the counts until November 21, 1927.

It is argued by Haag that it is not essential in order that the doctrine of *Mason* v. *Hepburn*, supra, apply, that there should be a spurring into activity. It is not necessary to pass upon the question as to whether the facts of record disclose such a spurring into activity or not, in view of the fact that we conclude that there was no suppression or concealment. Suppression and concealment for a long period of time, seven years, together with a spurring into activity, were the basis of the holding in *Mason* v. *Hepburn*, supra. In that case there was a deliberate withholding of the invention from the public by Mason for motives not in harmony with the purposes of the patent law for a period of seven years, and he only claimed it then when he saw the patent going to another. A very different case is presented on the present record.

We have frequently discussed the doctrine of *Mason* v. *Hepburn*, supra, and have definitely indicated that we will not extend it. We said in *Miller* v. *Hayman*, 18 C. C. P. A. (Patents) 848, 46 F.(2d) 188, that the doctrine of estoppel (or the doctrine akin to equitable estoppel, *Consolidated Fruit-Jar Company* v. *Wright*, 94 U. S. 92) was not favored, since estoppels preclude a party from showing the truth. The case of *Severson* v. *Olson*, 20 C. C. P. A. (Patents) 946, 64 F.(2d) 694, involved facts in many respects similar to those at bar. We there fully set out our views as to the doctrine of the *Mason* v. *Hepburn* case, supra, as far as the facts of *Severson* v. *Olson*, supra, would permit. Much of what we said there is applicable here. We quote:

> After very careful consideration of the record facts we conclude that such activities of Severson and his company as are shown to have occurred during this controverted period of nearly two years negative suppression and concealment rather than support them. We think the Board was in error in applying the doctrine of *Mason* v. *Hepburn*, supra, so as to deny Severson priority of the involved invention. He was clearly the first inventor, in fact, and we think should have been so regarded in law.
>
> • • • • • • • •
>
> Whether the "spurred into activity" consideration is or is not an essential factor of every case, we are not inclined to apply the doctrine of equitable estoppel unless this fact is present or unless the circumstances as a whole are equally persuasive of the inequitable position of the first inventor. In other words, we are not disposed to extend the doctrine or make more liberal application of it in interference cases than was made in *Mason* v. *Hepburn*, supra. On the contrary we recognize the danger that might flow from its loose application, and that, unless great caution is observed, it might be gradually extended until its application resulted in far greater inequities than it was designed to cure. Only where such gross inequities clearly threaten to defeat the spirit and the purposes of the patent laws must it be given controlling effect.

In the case at bar, Altorfer never indicates a disposition either to regard his invention as a failure or to withhold it from the public. Upon the record before us we cannot regard his activities in 1921 as an unsuccessful experiment which was abandoned, and which, therefore, did not amount to a reduction to practice. We think he fully reduced the invention to practice in 1921, and, being the first inventor, he can only be deprived of his award of priority by a clear showing that his subsequent conduct places him clearly within the doctrine announced in *Mason* v. *Hepburn*, supra. No one can read the record before us without being convinced that Altorfer is not in the position of a successful inventor who, after making an invention, secretes it with a view of withholding it from the public for some motive not in harmony with the purpose of the enactment of the patent laws. The fact that the public did not get it until after Haag had claimed it, is of itself not conclusive that Altorfer intended to suppress the same in the sense that suppression was used in *Mason* v. *Hepburn*, supra. Conceding that Altorfer's activities and delay, when considered with the explanations offered, do not show such promptness and diligence as the framers of the patent laws might hope for, and conceding that such delay has worked a hardship upon Haag and Dehle, or at least one of them, nevertheless, for reasons which we have hereinbefore stated, we do not think there are such inequities shown as to bar the first inventor in fact from being regarded as such for patent purposes.

The following are some of the leading cases on the applicability of the doctrine akin to the doctrine of equitable estoppel laid down in *Mason* v. *Hepburn*, supra: *Severson* v. *Olson*, supra; *Miller* v. *Hayman*, supra; *Nystrom et al.* v. *Mancuso*, 20 C. C. P. A. (Patents) 934, 64 F.(2d) 698; *Jardine et al.* v. *Long*, 19 C. C. P. A. (Patents) 1243, 58 F.(2d) 836; *Rhinevault* v. *Pflester*, 20 C. C. P. A. (Patents) 1112, 65 F.(2d) 161.

In view of the above conclusions, it is unnecessary to consider Haag's and Dehle's records or other activities in connection with the invention at issue. Neither tribunal gave either Haag or Dehle a conception date earlier than September, 1923. It is not necessary for us to consider the question of diligence on the part of Altorfer. His activities subsequent to 1921 may be relied upon, however, as

negativing abandonment, suppression or concealment.

It is our conclusion that Altorfer, being the first to conceive and the first to reduce to practice the invention expressed in the counts at bar, and not having suppressed or concealed his invention so as to make applicable the doctrine akin to equitable estoppel, is entitled to the award of priority in this proceeding. The decision of the Board of Appeals is reversed and priority of invention of all the counts at issue is awarded to appellant Altorfer.

Reversed.

LENROOT, J., concurs in the conclusion.

U. S. Court of Appeals for the District of Columbia

FINLEY ET AL. *v.* COE

No. 6,292. Decided April 8, 1935

1. DESIGNS—PATENTABILITY—INVENTION NECESSARY.

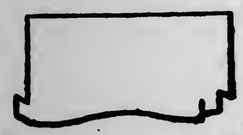
The authority for the issuance of a design patent is found in sec. 4929 Revised Statutes, which provides that any person who has "invented" any new, original, and ornamental design for an article of manufacture, may, under certain conditions, obtain a patent therefor. Design patents therefore require as high a degree of the inventive or original faculty as mechanical patents.

2. SAME—SAME—SHINGLE.

A design for a shingle *Held* unpatentable as lacking invention over the prior art.

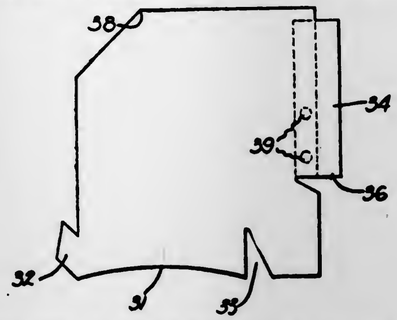
Mr. Joseph W. Milburn, for appellants.

Mr. T. A. Hostetler, Solicitor of the Patent Office, for appellee.



Before MARTIN, Chief Justice, and ROBB, VAN ORSDEL, HITZ, and GRONER, Associate Justices

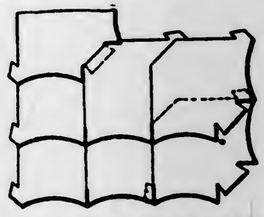
ROBB, *A. J.*:



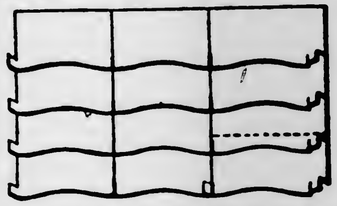
Appeal from a decree in the Supreme Court of the District dismissing appellants' bill, filed under the provisions of sec. 4915, Revised Statutes, as amended (35 U. S. C. A. sec. 63), seeking to authorize the Commissioner of Patents to issue a shingle design patent to appellant Paraffine Companies, the assignee of the alleged inventor, appellant Finley.

The shingle is rectangular in shape, the lower edge forming a reverse curve, with the concave portion of the curve in the center and the convex portions at the ends. The side ends of the shingle are formed by straight parallel lines. A tab is formed at one lower corner of the shingle, and a notch is formed at the opposite lower corner. When these shingles are laid, with the tab of one shingle interlocking with the notch of an adjacent shingle, the adjacent convex curve portions will meet and produce a continuous convex curve.

We here reproduce appellants' drawing of the shingle.



The Examiner rejected the claim as substantially met by appellant Finley's mechanical patent No. 1,604,745. We here reproduce Fig. 4 of that patent.



The Board of Appeals sustained the primary Examiner; thereupon this suit was instituted.

The functional parts of the reference shingle contribute nothing to the design. *Martin Copeland Co.* v. *Pilot Electric Co.*, 32 F.(2d) 235; *Ashley* v. *Weeks-Numan Co.*, 220 F. 809, 136 C. C. A. 465; *In re Mygatt*, 39 App. D. C. 432, 188 O. G. 1055.

We here reproduce from appellants' brief in the Patent Office a drawing showing the appearance of the shingles of the reference when laid:

Also a drawing illustrating the shingle of the issue when laid:

The authority for the issuance of a design patent is found in sec. 4929, Revised Statutes, as amended (35 U. S. C. A. sec. 73), which provides that "any person who has invented any *new, original, and ornamental* design for an article of manufacture" not known or used by others in this country before his invention thereof, etc., may obtain a patent therefor. [Italics ours.] Design patents, therefore, require as high a degree of the inventive or original faculty as mechanical patents. *Knapp* v. *Will & Baumer Co.*, 273 F. 380; *Smith* v. *Whitman Saddle Company*, 148 U. S. 674, 679, 63 O. G. 912.

Appellants contend that to modify the lower edge of the shingle shown in the Finley mechanical patent by using a reverse curve instead of a simple curve involves invention. To meet this contention the Patent Office tribunals cited the patent to Sherriff, No. 1,701,640, which discloses a reverse curve on the lower edge of the same type of shingle. We agree with the Patent Office and the court below that the use in the shingle of the application of the reverse curve disclosed in the Sherriff patent instead of the single curve disclosed in the Finley mechanical patent was not the exercise of originality and, therefore, did not involve invention. In *In re Sherman*, 35 App. D. C. 100, 154 O. G. 839, involving an application for a design patent, we said:

"While in a close case utility may be given some consideration, the real question is whether there is such originality shown as to call for the exercise of the inventive faculty."

The decree is affirmed.

Affirmed.

1,774,252, H. T. Bussman, Electric fuse and method of making same, filed Mar. 28, 1935, D. C., W. D. Pa., Doc. E 3059, *McGraw Electric Co.* v. *Great Western Fuse Co.*

1,776,070, C. Hinde, Process of disposing of sulphuric acid materials, D. C., S. D. Calif. (Los Angeles), Doc. E 451–C, *C. Hinde* v. *Associated Oil Co. et al.* Dismissed Mar. 29, 1935.

1,777,889, E. S. Ostler, Time stamp, filed Nov. 9, 1934, D. C., N. D. Ill., E. Div., Doc. 14177, *Stromberg Electric Co.* v. *Simplex Time Recorder Co.* Dismissed without prejudice Dec. 27, 1934.

1,781,271, G. W. Cowdrey, Bathing suit, D. C., S. D. Calif. (Los Angeles), Doc. E T–94–C, *G. W. Cowdrey et al.* v. *Pacific Knitting Mills, Inc., et al.* Dismissed with prejudice Jan. 29, 1935.

1,794,358, W. Bauer, Pad making machine, filed Aug. 27, 1934, D. C., N. D. N. Y., Doc. 2855, *International Cellucotton Products Co.* v. *The Sterlick Co., Inc.*

1,802,700, V. A. Boker, Nozzle for lubricating system, filed Mar. 12, 1935, D. C., N. D. Ill., E. Div., Doc. 14362, *Min-A-Max Co. et al.* v. *The Norlipp Co.*

1,816,118, M. C. Knight, Ice and water boat, filed Dec. 1, 1934, D. C., N. D. N. Y., Doc. 2868, *M. C. Knight* v. *Z. Powers.*

1,822,710, H. Pennington, Rotary drilling rig, filed Mar. 23, 1935, D. C., S. D. Tex. (Houston), Doc. E 670, *H. Pennington* v. *The National Supply Co. of Texas.*

1,828,094, H. Andrewes, Electrical frequency-changing apparatus of the thermionic type, D. C., M. D. Pa., Doc. 1083, *Radio Patents Corp.* v. *Penn Electrical Engineering Co.* Dismissed without prejudice Apr. 6, 1935.

1,838,042, H. Schwartz, Bushing structure and sealing means therefor, D. C., N. D. Ill., E. Div., Doc. 11371, *Barrel Fitting & Seal Corp. of America* v. *American Flange & Mfg. Co.* Dismissed for want of equity Sept. 8, 1933. Decree affirmed Jan. 26, 1935.

1,838,189, E. D. Rattigan, Fibrous packing, D. C., E. D. Pa., Doc. 7773, *E. D. Rattigan* v. *Crandall Packing Co.* Consent decree granting injunction Mar. 27, 1935.

1,847,839, A. J. Kusel, Refrigerating apparatus assembly, D. C., E. D. Pa., Doc. 7841, *H. Roberts* v. *The General Electric Co.* Dismissed Oct. 8, 1934.

1,855,168, C. L. Farrand, Loudspeaker, D. C., N. D. Ill., E. Div., Doc. 12469, *Utah Radio Products Co. et al.* v. *Goldblatt Bros., Inc.* Dismissed without prejudice Nov. 23, 1934. Doc. 12536, *Utah Radio Products Co. et al.* v. *Triangle Electric Co.* Decree as above.

1,863,123, F. Pertot, Hat form, filed Apr. 3, 1935, D. C., S. D. N. Y., Doc. E 80/90, *F. Pertot* v. *Vogue Hat Block & Die Corp. et al.*

1,865,995, A. L. Wurster, Cravat holder, filed Apr. 4, 1935, D. C., E. D. N. Y., Doc. E 7566, Wreal Cravat Holder *Co., Inc.*, v. *Lordds, Inc.*

1,878,569, J. G. Zolleis, Handle for valves, filed Apr. 1, 1935, D. C., E. D. N. Y., Doc. E 7553, *J. G. Zolleis* v. *J. A. Brudermann.*

1,880,174, J. Dugan, Continuous aim gun-fire control system, filed Apr. 1, 1935, D. C., E. D. N. Y., Doc. E 7550, *J. Dugan* v. *Ford Instrument Co., Inc.*

1,881,324, H. E. Metcalf, Signal reproducer, D. C., N. D. Ill., E. Div., Doc. 13104, *The Magnavox Co.* v. *Quam-Nichols Co. et al.* Dismissed without prejudice Dec. 4, 1934.

1,881,351, H. T. Bussmann, Electric fuse and method of assembling same, filed Mar. 28, 1935, D. C., W. D. Pa., Doc. E 3059, *McGraw Electric Co.* v. *Great Western Fuse Co.*

1,883,694, W. E. Goble, Brush picking and macerating machine, filed Mar. 6, 1935, D. C., S. D. Calif. (Los Angeles), Doc. E D–85, *M. B. Keithly* v. *W. G. Firstenberger et al.*

1,901,331, E. S. Pridham, Electro-dynamic loud speaker, D. C., N. D. Ill., E. Div., Doc. 13105, *The Magnavox Co.* v. *Ariab Mfg. Co. et al.* Dismissed Dec. 3, 1934. Doc. 13187, *The Magnavox Co.* v. *Ariab Mfg. Co. et al.* Dismissed without prejudice Dec. 4, 1934. Doc. 13199, *The Magnavox Co.* v. *Quam-Nichols Co. et al.* Dismissed Dec. 3, 1934. Doc. 13200, *The Magnavox Co.* v. *P. H. Tartak.* Dismissed without prejudice Dec. 5, 1934.

1,912,141, J. P. Hubbell, Method of fumigation, C. C. A., 3d Cir., Doc. 5078, *J. P. Hubbell et al.* v. *American Cyanamid Co.* Decree affirmed Mar. 25, 1935. Doc. 5538, *American Cyanamid Co.* v. *J. P. Hubbell.* Decree as above.

1,916,460, S. I. Bousman, Sedimentation device, D. C., S. D. N. Y., Doc. E 77/105, *The Dorr Co., Inc.*, v. *Hardinge Co., Inc.* Consent order of discontinuance (notice Mar. 29, 1935).

1,921,437, L. K. Stupell, Ornament, filed Apr. 1, 1935, D. C., S. D. N. Y., Doc. E 80/79, *L. K. Stupell et al.* v. *Monocraft Products Co., Inc.*

1,930,809, P. Kollsman, Aneroid and operating means therefor, D. C., E. D. N. Y., Doc. E 7232, *P. Kollsman* v. *Air Transport Equipment Co.* Decree pro confesso for plaintiff Apr. 3, 1935.

1,932,789, H. B. Kline, Desulfurizing rayon in the package form, filed Mar. 18, 1935, D. C. Del., Doc. E 1102, *Industrial Rayon Corp.* v. *Tubize Chatillon Corp.*

1,956,613, Corn & Hyatt, Heat transfer facilities in ice cream freezers, filed Mar. 11, 1935, D. C., N. D. Ill., E. Div., Doc. 14361, *Tuthill Pump Co.* v. *R. E. Gebhardt Co.*

1,966,319, K. Stroedter, Driving gear of reciprocating mechanism such as jiggers, shaking conveyors and the like, filed Mar. 28, 1935, D. C., M. D. Pa., Doc. 1164, *A. Eickhoff* v. *Vulcan Iron Works.*

1,968,288, C. W. Floss, Variable speed transmission, filed Mar. 25, 1935, D. C., E. D. Mich. (Detroit), Doc. 6856, *C. W. Floss* v. *Hudson Motor Car Co.*

1,978,305, Hall & Eichelman, Expansion joint, filed Mar. 6, 1935, D. C., N. D. Ill., E. Div., Doc. 14,356, *J. E. Whealan et al.* v. *Truscon Steel Co.*

1,982,445, P. E. Miquelon, Boot, filed Mar. 25, 1935, D. C., E. D. Mich. (Detroit), Doc. 6857, *Universal Products Co., Inc.*, v. *C. H. Barber et al.*

Re. 17,329, J. Schmidt, Woodworking machine, D. C., N. D. Ill., E. Div., Doc. 9654, *J. Schmidt* v. *Altizer Elevator Mfg. Co.* Dismissed for want of prosecution Nov. 5, 1934.

Re. 18,632, G. W. Stedwell, Liquid dispensing apparatus, filed Mar. 22, 1935, D. C., S. D. N. Y., Doc. E 80/17, *Keystone Controls, Inc.*, v. *Aqua Systems, Inc., et al.*

Des. 73,709, H. C. Noe, Lamp shade, D. C., S. D. N. Y., Doc. E 60/138, *W. R. Noe & Sons* v. *East Side Metal Spinning & Stamping Corp.* Dismissed without prejudice (notice Mar. 26, 1935).

Des. 90,349, H. M. Wexberg, Menu card, D. C., N. D. Ill., E. Div., Doc. 14,029, *H. M. Wexberg* v. *Eitel, Inc.* Dismissed for want of equity Oct. 4, 1934.

Des. 90,897, D. C. Rockola, Game device, D. C., N. D. Ill., E. Div., Doc. 13,718, *D. C. Rockola* v. *The Ad-Lee Co.* Dismissed without prejudice Dec. 12, 1934.

Des. 91,960, Netzel & Frost, Auto floor mat, filed Mar. 1, 1935, D. C., N. D. Ill., E. Div., Doc. 14343, *F. S. Frost, et al* (*Frost Rubber Works*) v. *Milwaukee Avenue Motor Sales Co., et al.*

Des. 93,030, B. B. Manaster, Cravat holder, D. C., N. D. Ill., E. Div., Doc. 14,050, *B. B. Manaster* v. *J. O. Pollack & Co., et al.* Dismissed by stipulation Nov. 16, 1934.

Des. 94,386, I. Geist, Blouse, D. C., S. D. N. Y., Doc. E. 79/346, *Mitchell & Weber, Inc.* v. *Petrie's, Inc.* Consent decree for plaintiff (notice Apr. 3, 1935).

Des. 94,465, A. M. Bressler, Sandal, filed Mar. 22, 1935, D. C., S. D. N. Y., Doc. E 80/19, *Deauville Specialty Corp.* v. *W. R. Mackey.*

Des. 94,603, L. H. Forsch, Lady's suit, filed Apr. 2, 1935, D. C., S. D. N. Y., Doc. E 80/84, *The Forsch Benjamin Co.* v. *M. W. Haft & Bros., Inc.*

Des. 94,645, M. Bernstein, Ensemble dress, filed Apr. 2, 1935, D. C., S. D. N. Y., Doc. E 80/89, *Ace-High Dresses, Inc.*, v. *Benfrey Dress Co., Inc.*

Des. 94,647, M. Bernstein, Ensemble dress, filed Mar. 25, 1935, D. C., S. D. N. Y., Doc. E 80/61, *Ace-High Dresses, Inc.*, v. *Lombardy Frocks, Inc.* Same, filed Apr. 6, 1935, D. C., S. D. N. Y., Doc. E 80/101, *Ace-High Dresses, Inc.*, v. *Mohawk Dress Co., Inc.*

Des. 94,821, W. Freedman, Blouse, filed Mar. 22, 1935, D. C., S. D. N. Y., Doc. E 80/18, *Irving Kemp, Inc.*, v. *Pedigree Skirt & Sportwear Co., Inc.* Consent decree for plaintiff (notice Apr. 2, 1935). Same, filed Mar. 26, 1935, D. C., S. D. N. Y., Doc. E 80/63, *Irving Kemp, Inc.*, v. *H. Fineman et al* (*Marilyn Blouse Co.*) Doc. E 80/64, *Irving Kemp, Inc.*, v. *Variety Blouse & Sportwear Co., Inc.* Consent decree for plaintiff (notice Apr. 2, 1935). Same, filed Apr. 1, 1935, D. C., S. D. N. Y., Doc. E 80/82, *Irving Kemp, Inc.*, v. *Albrecht's Stores, Inc.* Same, filed Apr. 8, 1935, D. C., S. D. N. Y., Doc. E 80/102, *Irving Kemp, Inc.*, v. *Janice Shops Corp.*

T. M. 63,492, G. Heileman Brewing Co., Beer, filed Feb. 1, 1935, D. C., N. D. Ill., E. Div., Doc. 14,306, *G. Heileman Brewing Co.* v. *Old Style Lager Mfg. & Distributing Co., et al.*

T. M. 162,305, Mattingly & Moore Distillery Co., Whiskey, D. C., N. D. Ill., E. Div., Doc. 14,059, *Frankfort Distilleries, Inc.*, v. *H. Schmidt* (*Otto Schmidt Wine Co.*). Consent decree enjoining defendant Nov. 22, 1934.

T. M. 169,597, Decatur Brewing Co., Non-intoxicating, non-alcoholic, non-cereal, malt beverage, sold as a soft drink, D. C., N. D. Ill., E. Div., Doc. 7498, *Premier Malt Products Co.* v. *R. T. Kittredge & Co. et al.* Consent decree enjoining defendant Sept. 5, 1934.

T. M. 200,419. D. Gray, Face powder, compacts, etc., D. C., N. D. Ill., E. Div., Doc. 13,610, *D. Gray* v. *D. Ray.* Decree enjoining defendant Aug. 14, 1934.

T. M. 216,819. E. Frederics, Inc., Steam pad, D. C., N. D. Ill., E. Div., Doc. 11,324. *E. Frederics, Inc.*, v. *National Mineral Co.* Decree holding trade-mark valid. Injunction granted Nov. 1, 1934.

T. M. 291,312, Sinclair Refining Co., Lubricating oil, D. C., N. D. Ill., E. Div., Doc. 14,143, *Sinclair Refining Co.* v. *Motor Tire Sales Corp.* Consent decree enjoining defendant Nov. 20, 1934.

Adjudicated Patents

(C. C. A. III.) Hacknay patent, No. 1,578,725, for acetylene generator, evidence *Held* insufficient to establish defense of prior use. *Imperial Brass Mfg. Co.* v. *Hackney*, 75 F.(2d) 689.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed:

Pat. 1,872,205, S. C. Winger, Quick acting mechanism, decided April 20, 1935, claims 4 and 5.

Pat. 1,879,956, Eva Sperling, Instantaneous water heater, decided April 5, 1935, claims 1, 2, 3, and 4.

Pat. 1,909,765, J. E. Jenkins and S. E. Adair, Sound control method and means for practicing same, decided April 22, 1935, claim 9.

Pat. 1,922,726, W. A. Del Mar, Shielded rubber insulated cable, decided April 16, 1935, claims 1 and 2.

Pat. 1,942,026, Samuel Groener, A spirally bound sheaf, decided April 25, 1935, claims 1, 2, and 3.

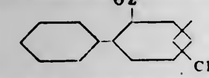
Pat. 1,977,700, F. H. Sebring, Jr., L. C. Loschky and J. T. Pugh, Jigger for forming articles of plastic material, decided April 22, 1935, claims 1, 2, 3, 4, 5, 6, and 7.

Reissue Pat. 16,870, E. H. Friedrich, Metal flashing, decided March 11, 1935, claim 9.

Disclaimers

1,765,714.—*Ralph W. Bulkeley*, Grand Rapids, Mich. AUTOMOBILE TOP. Patent dated June 24, 1930. Disclaimer filed April 20, 1935, by the *patentee*.

Hereby enters this disclaimer to that part of the claim in said specification which is in the following words, to wit:



"2. The combination with an automobile body having a windshield, a door opening and a door for said opening, of a collapsible top for said body comprising a bow located adjacent said door opening and constituting a vertical side of said opening, a top structure associated with said bow and extending rearwardly therefrom, a bar detachably connected to the upper horizontal edge of said windshield, a flexible top covering extending between said bow and said bar and attached respectively to said members, top tightening devices extending between and attached at their respective ends to said bar and said bow and jointed between their ends for folding, and a flexible weather strip free of said top tightening devices and extending between and attached at its respective ends to said bar and said bow and located horizontally across and forming the top side of said door opening and engaged by the upper edge of said door when the door is closed."

1,907,728.—*Edgar C. Britton*, Midland, Mich. DISINFECTANT. Patent dated May 9, 1933. Disclaimer filed April 19, 1935, by the assignee, *The Dow Chemical Company*.

Therefore, enters this disclaimer to certain of the claims of the above identified patent, and

Hereby disclaims claims 3 and 6.

Hereby disclaims from the scope of claim 1 any composition containing a compound characterized by the formula;

wherein Z represents hydrogen and *n* represents the integer 1.

Hereby disclaims from the scope of claims 2 and 5 any composition containing a compound characterized by the formula:

wherein Z represents hydrogen.

1,963,254.—*William G. Urmson*, Hamden, Conn. ELECTRON DISCHARGE DEVICE. Patent dated June 19, 1934. Disclaimer filed April 19, 1935, by the assignee, *Radio Research Laboratories, Inc.*

Hereby enters this disclaimer to the following claims of said patent, to wit:

Claims 2, 3, 4, 7, 10 and 11.

1,904,698.—*Aaron Simons*, Bronx, N. Y. METHOD OF MAKING DRAWING DIES. Patent dated April 18, 1933. Disclaimer filed April 17, 1935, by the assignee, *Morris Simons*.

Hereby enters this disclaimer, limiting claim 1 of said Letters Patent as follows:

By restricting the term "nib" to a substantially cylindrical block containing tungsten or other carbide.

1,923,724.—*Ronald George Griffith*, Croydon, England. TELEGRAPH SYSTEM. Patent dated August 22, 1933. Disclaimer filed April 24, 1935, by the assignee, *Creed and Company, Limited*.

Hereby disclaims claim 1 of said Patent No. 1,923,724, said claim being in the following words:

A telegraph system comprising a first signalling station having signal transmitting means and a second signaling station having signal responsive means operable by signals transmitted from the first station, signal transmitting means, and means operable by said signal responsive means for re-transmitting to said first signaling station the signals as received therefrom, the signal transmitting means at the first station being entirely free from control of the second station.

TRADE-MARKS

OFFICIAL GAZETTE, MAY 14, 1935

[VOL. 454 · No. 2]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly-Prepared Materials

Ser. No. 361,366. NEWMARKET LEATHER CO., INC., New York, N. Y. Filed Feb. 13, 1935.

No claim is made to the words "tuff" and "Scuff Proof" apart from the mark shown on the drawing.

For Leather for Shoe Uppers.

Claims use since Aug. 1, 1935.

Ser. No. 362,604. WAGNER-FELLER & CO., New York, N. Y. Filed Mar. 15, 1935.

No claim is made to the words "Seal" and "Dyed Coney" apart from the mark shown on the drawing.

For Dyed Fur.

Claims use since Mar. 1, 1935.

Ser. No. 363,153. BURTON-DIXIE CORPORATION, Chicago, Ill. Filed Mar. 29, 1935.

Fluf-Lastic

For Cotton Bats.

Claims use since Apr. 12, 1933.

Ser. No. 363,172. C. D. KEPNER LEATHER COMPANY, Boston, Mass. Filed Mar. 29, 1935.

WIBUK

For Leather.

Claims use since Feb. 1, 1935.

CLASS 2

Receptacles

Ser. No. 362,837. ODORA COMPANY, INC., New York, N. Y. Filed Mar. 21, 1935.

ODORA

For Paper Garment Bags.

Claims use since June 4, 1934.

Ser. No. 363,243. TRANSPARENT PACKAGE COMPANY, Chicago, Ill. Filed Mar. 30, 1935.

No claim is made to the words "Transparent", "Sealed", "Identified", and "Quality" apart from the mark as shown.

For Sausage Cases Made from Regenerated Cellulose.

Claims use since Mar. 25, 1935.

CLASS 3

Baggage, Animal Equipments, Portfolios, and Pocketbooks

Ser. No. 362,686. JACK ISRAEL, INC., New York, N. Y. Filed Mar. 18, 1935.

ZIPOVER

For Ladies' Handbags.
Claims use since Mar. 11, 1935.

Ser. No. 362,746. THE MAY DEPARTMENT STORES COMPANY, doing business as The May Company; Famous-Barr Company; and M. O'Neil Company, Baltimore, Md.; Cleveland, Ohio; Denver, Colo.; Los Angeles, Calif.; St. Louis, Mo.; and Akron, Ohio. Filed Mar. 19, 1935.

Charmante

For Ladies' Leather and Fabric Handbags.
Claims use since Mar. 4, 1935.

Ser. No. 362,154. BURTON-DIXIE CORPORATION, Chicago, Ill. Filed Mar. 20, 1935.

Fluf-Lastic

For Horse Collar Pads.
Claims use since May 2, 1934.

CLASS 4

Abrasive, Detergent, and Polishing Materials

Ser. No. 356,187. JOHN T. STANLEY CO., INC., New York, N. Y. Filed Dec. 11, 1934.

JABON EL GALLO

No claim is made to the word "Jabon" apart from the mark shown in the drawing.
For Soap.
Claims use since Feb. 1, 1916.

Ser. No. 360,751. CASTILE TOILETRIES INC., New York, N. Y. Filed Jan. 28, 1935.

La CANTANA
CASTILE SOAP

MADE WITH GENUINE
IMPORTED OLIVE OIL
from Spain

All the wording appearing on the drawing with the exception of the words "La Cantana" and the letters "L C" is disclaimed when used separate and apart from the other features of the mark as shown on the drawing.
For Soaps.
Claims use since Jan. 8, 1935.

Ser. No. 361,725. THE CINCINNATI SOAP COMPANY, Cincinnati, Ohio. Filed Feb. 22, 1935.

PAL

For Soap or Soap Flakes.
Claims use since Jan. 4, 1935.

Ser. No. 361,776. THE J. T. ROBERTSON CO., INC., Syracuse, N. Y. Filed Feb. 23, 1935.

ALURA

The portrait appearing on the drawing is fanciful.
For Soaps and Toilet Soaps.
Claims use since May 17, 1934.

Ser. No. 362,681. HENDERSON BROTHERS CORPORATION, Johnstown, Pa. Filed Mar. 18, 1935.

Shoe Groom

The words "For White Shoes" are disclaimed apart from the mark as shown.
For Shoe Dressing and Polish.
Claims use since Feb. 1, 1935.

Ser. No. 363,091. COTY, INC., Wilmington, Del. Filed Mar. 28, 1935.

"Continentale"

For Soaps and Shaving Creams.
Claims use since Dec. 3, 1934.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

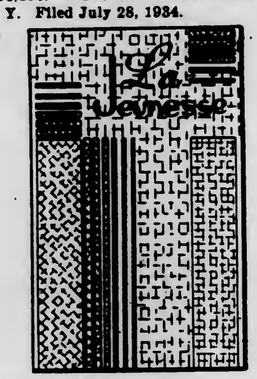
Ser. No. 346,582. ALFRED LEDERMAN, New York, N. Y. Filed Jan. 26, 1934.

NU-GLOSS

For Hair Rinse.
Claims use since July 1, 1933.

Ser. No. 349,005. CATARACT CHEMICAL COMPANY, INC., Buffalo, N. Y. Filed Mar. 23, 1934.

Countess Potocka



The portrait appearing on the drawing is that of Countess Potocka, deceased.
For Shampoo.
Claims use since Mar. 5, 1934.

Ser. No. 350,118. VICTOR VIVAUDOU, Los Angeles, Calif. Filed Apr. 17, 1934.

La Sept Mysterieux

For Astringents, Astringent Cerates, Bleach Creams, Beauty Creams, Cold Creams, Cleansing Creams, Obesity Creams, Refreshing Creams, Obesity Astringents, Dry Rouges, Liquid Rouges, Face Bleaches, Face Packs; Skin Whitener in Liquid, Cream, and Sold Form; Eyebrow and Eyelash Grower, Eye Drops, Eyebrow Pencils, Chemical Preparations Suitable for the Darkening of Eyebrows and Eyelashes, Pomades, Face Powders, Talcum Powders, Body Powders, Sachets, Hair Salves, Hair Elixirs, Dandruff Preparations, Hair Tonics, Hair Oils, Shampoos, Hair Dyes, Bath Salts, Smelling Salts, Lip Sticks, Incense, Tooth Powders, Mouth Washes, Dentifrices, Depilatories, Tooth Pastes, Nail Creams, Nail Bleaches, Nail Powders, Nail Polishes, Witch Hazel, Peroxide, Petroleum Jellies, Witch Hazel Salves, Camphor Creams, Foot Powders, Corn Salves, Deodorants, Disinfectants, Bay Rum, Perfumes, and Toilet Waters.
Claims use since Apr. 10, 1934.

Ser. No. 354,416. VADSCO SALES CORPORATION, Long Island City, N. Y. Filed July 28, 1934.

Applicant disclaims the sole right to the design apart from the mark as shown.
For Astringents, Astringent Cerates, Bleach Creams, Beauty Creams, Cold Creams, Cleansing Creams, Obesity Creams, Refreshing Creams, Obesity Astringents, Dry Rouges, Liquid Rouges, Face Bleaches, Face Packs; Skin Whitener in Liquid, Cream, and Sold Form; Eyebrow and Eyelash Grower, Eye Drops, Eyebrow Pencils, Chemical Preparation Suitable for the Darkening of Eyebrows and Eyelashes, Hand Lotions, Skin Lotions, After Shaving Lotions, Pomades, Face Powders, Talcum Powders, Body Powders, Sachets, Hair Salves, Hair Elixirs, Dandruff Preparations, Hair Tonics, Hair Oils, Shampoos, Hair Dyes, Bath Salts, Smelling Salts, Lip Sticks, Incense, Tooth Powders, Mouth Washes, Dentifrices, Depilatories, Tooth Pastes, Nail Creams, Nail Bleaches, Nail Powders, Nail Polishes, Witch Hazel, Peroxide, Petroleum Jellies, Witch Hazel Salves, Camphor Creams, Foot Powders, Corn Salves, Deodorants, Disinfectants, Bay Rum, Perfumes, and Toilet Waters.
Claims use since July 23, 1934.

Ser. No. 355,075. PARAFLUID GESELLSCHAFT M. B. H., Hamburg, Germany. Filed Aug. 16, 1934.

Pasquit

For Pharmaceutical Drugs and Preparations—Namely, Medicinal Mineral Oils, General Tonics, Cakes and Biscuits Containing a Medicament Having Laxative Properties.
Claims use since Aug. 1, 1933.

Ser. No. 355,076. PARAFLUID GESELLSCHAFT M. B. H., Hamburg, Germany. Filed Aug. 16, 1934.

„Treparol"

For Pharmaceutical Petroleum Oils and Petroleum Jelly.
Claims use since Dec. 29, 1928.

Ser. No. 355,298. DEUTSCHE HYDRIERWERKE, A.-G., Berlin-Charlottenburg, Germany. Filed Aug. 22, 1934.

Lanette

For Waxes Such as Spermaceti, Beeswax, Wool Wax, and Carnauba Wax; Industrial Alcohols, Such as Lauryl, Myristyl, Cetyl, Stearyl, Eicosyl, Carnaubyl, Ceryl, Cerotyl, Melissyl, Tetradecenyl, Cetenyl, Octadecenyl, Eicosenyl, Physetoleyl, Oleyl, Linoleyl, Linolenyl and Ricinoleyl and the Sulfates and Sulfonates of these Alcohols.
Claims use since Mar. 12, 1929.

Ser. No. 356,112. DIEHL RESEARCH LABORATORIES, LTD., Los Angeles, Calif. Filed Sept. 17, 1934.

SAN-O-GEN

For Dry Antiseptic Powder Used in Cleansing and Deodorizing for Vaginal Application.
Claims use since Aug. 28, 1934.

Ser. No. 357,073. CELINE WILLIAMS, doing business as Minute Products Co., New York, N. Y. Filed Oct. 12, 1934.

RAYO-GAS

For Salve for Colds, Rheumatic Pains, Headaches, Insect Bites, Swelling, Local Congestion and Irritation; Nose Drops for Colds and Nasal Catarrh; and Liniment for Rheumatic Pains and Strains.
Claims use since Sept. 17, 1934.

Ser. No. 357,427. FEM-CO INC., New York, N. Y. Filed Oct. 23, 1934.

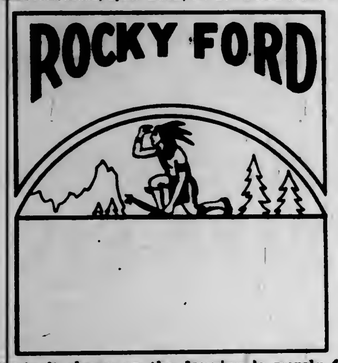
The words "Elixir Strontium Composita" appearing in the drawing are disclaimed.

For Medicinal and Pharmaceutical Preparations, designed for the Relief of Pain and Other Irregularities of Menstruation and the Menapause.

Claims use since Oct. 6, 1934.

Ser. No. 358,142. CHARLES E. LYON, JR., doing business as Lyon Laboratories, Winterset, Iowa. Filed Nov. 12, 1934.

TRADE  MARK



-SPRINT-

The words "Trade Mark" are disclaimed as apart from the mark as shown.

For Externally Applied Ointment for Athlete's Foot, Sunburn, Itch, Mosquito Bites, Gall Burns, Ringworm, Gym Itch, and Like.

Claims use since Aug. 27, 1934.

Ser. No. 358,675. SAM HAGLER, doing business as Rocky Ford Laboratories, New York, N. Y. Filed Nov. 27, 1934.

The portrait shown on the drawing is merely fanciful.

For Hair Tonic, Hair Dressing, Quinine Preparation for Hair, Lilac Toilet Water, Bay Rum Preparation, Mange Preparation for Hair, Cold Cream, and Shampoo Preparation for hair.

Claims use since Feb. 1, 1934.

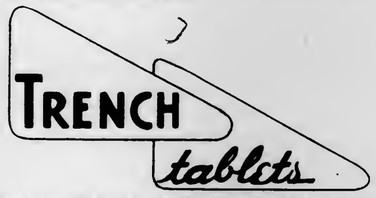
Ser. No. 358,765. MICHELE CONZA, Summit, N. J. Filed Nov. 30, 1934.

JELOPHEN

Applicant disclaims the term "Jel" apart from the mark shown.

For Antiseptic Jelly.

Claims use since Oct. 29, 1934.



Ser. No. 359,328. J. E. STROSCHEIN CHEMISCHE FABRIK KOMMANDITGESELLSCHAFT, Berlin, Germany. Filed Dec. 14, 1934.

Martol

For Medicinal Dietetic, and Pharmaceutical Preparations of Cold-Liver Oil and Oil Emulsions.

Claims use since Aug. 5, 1913.

Ser. No. 359,654. FENWICKE CORPORATION, New York, N. Y. Filed Dec. 26, 1934.

The word "tablets" is disclaimed, as shown on the drawing.

For Mouth Wash in Tablet Form.

Claims use since 1928.

Ser. No. 360,102. FRIEDRICH MERZ, doing business as Merz & Co., Frankfort-on-the-Main, Germany. Filed Jan. 10, 1935.

VAUKA

For Medicinal and Chemical Preparations—Namely, Pharmaceutical Drugs and Preparations Used in the Treatment of Venereal Diseases; Disinfectants, Chemical Preparations for Preserving Food; Preparations for Tanning and Finishing Leather; Perfume, Cosmetics—Namely, Rouge, Lipstick and Powder; Ethereal Oils; Bleaching Preparations, Laundry Starch, Bluing, Dye Tints, and Chemical Anti-Corrosive Preparations.

Claims use since November, 1934.

Ser. No. 361,030. MAX WM. SHARPS, doing business as Irvax Laboratories, Chicago, Ill. Filed Feb. 4, 1935.

IRVAX

For Cough Syrup, Cascara, Quinine, and Black Draught.

Claims use since July 1, 1931.

Ser. No. 361,339. TAKAMINE CORPORATION, New York, N. Y. Filed Feb. 12, 1935.

MOXOL

For a Preparation Used as a Hypodermic or Intravenous Injection in the Treatment of Arteriosclerosis, Neuralgia, Rheumatism, Pneumonia, Influenza, Carbuncle, Phlegmon, Puerperal Fever, Acute Inflammatory Diseases, Erysipelas, Tinnitus, Urticaria, Bronchial Asthma, Heart-Asthma, Angina Pectoris, Insomia, Tuberculosis, Night-Sweating, Chronic Morphine Poisoning, and for Promoting the Healing of Wounds.

Claims use since Jan. 31, 1935.

Ser. No. 361,345. Q. T. BILSBO, Asheville, N. C. Filed Feb. 11, 1935.

Q.T. TONIC

The word "Tonic" appearing in the drawing is disclaimed.

For Tonic for Disorders of the Digestive System.

Claims use since Nov. 10, 1932.

Ser. No. 361,962. GUERLAIN PERFUMERY CORPORATION OF DELAWARE, Wilmington, Del., and New York, N. Y. Filed Feb. 28, 1935.

SOUTHERN BREEZE

For Perfumes and Toilet Water.

Claims use since Feb. 14, 1935.

Ser. No. 362,326. ROGER & GALLET, New York, N. Y. Filed Mar. 9, 1935.

CHALLENGE

For Perfumes, Toilet Waters, Face and Toilet Powders, Powder and Rouge Compacts, Rouges, Lipsticks, Bath Salts, Lotions for the Skin and Hair, and Sachets.

Claims use since Feb. 14, 1935.

Ser. No. 362,372. JOHN MELLOR, doing business as Mell-Ex Company, Harrisburg, Pa. Filed Mar. 11, 1935.

For Salve for External Treatment of Boils, Carbuncles, and as an Antiseptic Application Against Skin Infections.

Claims use since Aug. 1, 1934.

Ser. No. 362,381. S. PFEIFFER MANUFACTURING COMPANY, St. Louis, Mo. Filed Mar. 11, 1935.

LIQUO-LENE

For Hair Tonic.

Claims use since Jan. 1, 1933.

Ser. No. 362,385. TATTOO, INC., Chicago, Ill. Filed Mar. 11, 1935.

TATTOO HAWAIIAN

For Lipstick, Rouge, Face Powder, and Eyelash and Eyebrow Mascara.

Claims use since Jan. 14, 1934.

Ser. No. 362,443. H. B. PEARCE, doing business as Ronko Products Co., Selma, N. C. Filed Mar. 12, 1935.

RONKO

For Medicinal Preparation for Use in Treating Bronchial Troubles.

Claims use since 1931.

Ser. No. 362,543. THE J. R. WATKINS COMPANY, doing business as Wade Laboratories, Newark, N. J. Filed Mar. 14, 1935.

ROYAL YORK

For Astringents, Astringent Cerates, Bleach Creams, Beauty Creams, Cold Creams, Cleansing Creams, Obesity Creams, Refreshing Creams, Obesity Astringents, Dry Rouges, Liquid Rouges, Face Bleaches, Face Packs, Skin Whitener in Liquid, Cream, and Solid Form; Eyebrow and Eyelash Grower, Eye Drops, Eyebrow Pencils, Chemical Preparations Suitable for the Darkening of Eyebrows and Eyelashes, Hand Lotions, Skin Lotions, After Shaving Lotions, Pomades, Face Powders, Talcum Powders, Body Powders, Sachets, Hair Salves, Hair Elixirs, Dandruff Preparations, Hair Tonics, Hair Oils, Shampoos, Hair Dyes, Shampoo Jelly, Bath Salts, Smelling Salts, Lip Sticks, Incense, Tooth Powders, Mouth Washes, Dentifrices, Tooth Pastes, Depilatories, Nail Creams, Nail Bleaches, Nail Powders, Nail Polishes, Witch Hazel, Peroxide, Petroleum Jellies, Witch Hazel Salves, Camphor Creams, Foot Powders, Corn Salves, Deodorants, Disinfectants, Bay Rum, Perfumes, and Toilet Waters.

Claims use since Feb. 23, 1935.

Ser. No. 362,562. ESSENTIAL PRODUCTS CORP., Chicago, Ill. Filed Mar. 15, 1935.

SUPER SELTZER

The word "Seltzer" is disclaimed apart from the mark shown on the drawing.

For Mineral Crystals Used as a Laxative, an Alkalizer, and Diuretic.

Claims use since Mar. 1, 1935.

Ser. No. 362,612. CENTRAL PERFUMERY & SUPPLY CO., INC., Astoria, Long Island City, N. Y. Filed Mar. 16, 1935.

The drawing is lined to indicate the colors red and white.

For After Shaving Lotion.

Claims use since Sept. 1, 1934.

Ser. No. 362,819. GENERAL AND MARINE LABORATORY, Crisfield, Md. Filed Mar. 21, 1935.

ALVAGEL

For Preparation for the Treatment of Burns from X-Rays and Radium and Other Forms of Burns and of Dermatitis and Ulcers.

Claims use since Feb. 5, 1935.

Ser. No. 362,840. RANDOLPH-LOWELL COMPANY, New York, N. Y. Filed March 21, 1935.

"SANDMAN"

For sedative to aid sleep.

Claims use since March 11, 1935.

Ser. No. 362,937. THE BENJAMIN ANSBHL COMPANY, St. Louis, Mo. Filed March 25, 1935.

SENSI-SKIN

No claim is made to the word "Skin" apart from the mark shown.

For Face Powder.

Claims use since Jan. 1, 1935.

Ser. No. 362,952. JOE CROSS, Belington, W. Va. Filed Mar. 25, 1935.

The name shown is a facsimile of applicant's signature.

For Insecticide for Beetles, Lice, Ticks, and Grasshoppers.

Claims use since Mar. 20, 1935.

Ser. No. 363,026. ALBIS COMPANY, Portland, Me. Filed Mar. 27, 1935.

ALBIS

For Almond Cream Lotion.

Claims use since Mar. 1, 1933.

CLASS 10

Fertilizers

Ser. No. 363,168. INTERNATIONAL REDUCTION CORPORATION, Chicago, Ill. Filed Mar. 29, 1935.

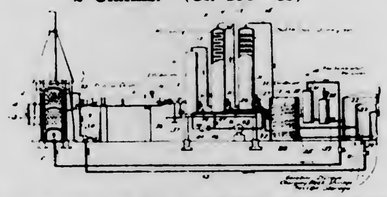
REISSUES

MAY 14, 1935



19,568

PROCESS FOR TREATING PETROLEUM HYDROCARBONS

Roy Cross, Kansas City, Mo., assignor, by mesne assignments, to Gasoline Products Company, Inc., Wilmington, Del., a corporation of Delaware

Original No. 1,775,067, dated September 2, 1930, Serial No. 729,693, August 2, 1924. Application for reissue August 31, 1932, Serial No. 631,293

2 Claims. (Cl. 196—48)

2. In a process for converting higher boiling hydrocarbons into lower boiling hydrocarbons suitable for motor fuel wherein said higher boiling hydrocarbons are subjected to conversion temperature while maintained at relatively high superatmospheric pressure in a conversion zone for a period sufficient to effect the desired conversion thereof and the converted products while at elevated temperature are passed to a vaporizing zone maintained under pressure sufficiently lower than that maintained in said conversion zone to normally cause substantially all the converted products to separate into vapors and a dry coke difficult to remove; the improvement which comprises fractionally condensing vapors liberated in said vaporizing zone, separately collecting a heavy condensate fraction, an intermediate condensate fraction, and a light final condensate fraction, and introducing intermediate condensate so obtained into said vaporizing zone in an amount sufficient to prevent vaporization of the heavy liquid constituents of said converted products and produce a liquid residue suitable for fuel oil, withdrawing said fuel oil from said vaporizing zone at a substantially constant rate sufficient to prevent the accumulation of large quantities of fuel oil therein, and returning said heavy condensate to said conversion zone.

19,569

ANÆSTHETIC COMPOSITION

Samuel D. Goldberg, Brooklyn, N. Y., assignor to Novocol Chemical Mfg. Co. Inc., Brooklyn, N. Y., a corporation of New York

No Drawing. Original No. 1,924,685, dated August 29, 1933, Serial No. 500,671, December 6, 1930. Application for reissue December 14, 1934, Serial No. 757,530

10 Claims. (Cl. 167—52)

1. An anæsthetic solution for hypodermic injection containing a solvent, an acid containing anæsthetic material for local anæsthetic, a vasoconstricting material and a buffer including a weak acid to dissolve and maintain said vasoconstricting material in solution and to modify the pH of the solution, said solution being substantially stable and having a pH value in a range from approximately 5.7 up to approximately neutral.

19,570

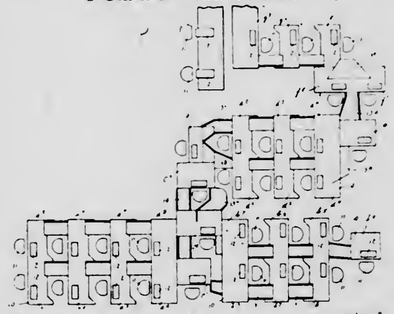
METHOD AND APPARATUS FOR CEMENTING WELLS

Erle Palmer Halliburton, Los Angeles, Calif., assignor to Halliburton Oil Well Cementing Company, Duncan, Okla., a corporation of Delaware

Original No. 1,860,669, dated May 31, 1932, Serial No. 588,110, January 22, 1932. Application for reissue January 18, 1933, Serial No. 652,387

32 Claims. (Cl. 166—21)

1. In a method of cementing long strings of casing in a well hole, the steps of: alternately introducing predetermined volumes of a cementitious material and hydraulic fluid into a casing; ejecting the lowermost volume of cementitious material from said casing into a well hole while retaining the hydraulic fluid immediately thereabove, and then ejecting the cementitious material next above said ejected volume into the well hole at a point above said retained volume of hydraulic fluid.



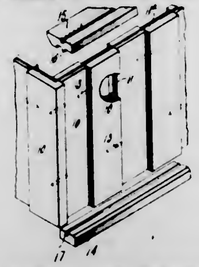
19,571

METHOD OF MANUFACTURING GARMENTS

Folkert Allen Schmidt and Henry H. Kramer, Terre Haute, Ind., assignors to Stahl-Urban Company, Terre Haute, Ind., a corporation

Original No. 1,981,124, dated November 20, 1934, Serial No. 675,908, June 15, 1933. Application for reissue February 18, 1935, Serial No. 7,151

4 Claims. (Cl. 2—243)



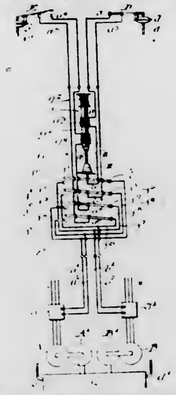
4. A method of manufacturing garments hav-

ing portions for covering the torso and at least two limbs and including right and left blanks, said method comprising moving a series of left blanks through certain stations toward a predetermined station, separately moving a series of right blanks through other certain stations toward another predetermined station, performing on each of said blanks during their travel minor assembly operations, moving toward said predetermined stations other sections of the garment to be united separately to said left and right blanks, performing on said other sections minor assembly operations during their travel to said predetermined stations, separately uniting said left and right blanks to said other sections at said separate predetermined stations, and moving said united left and right blanks and other sections through successive stations and performing thereon successively finishing operations.

PATENTS

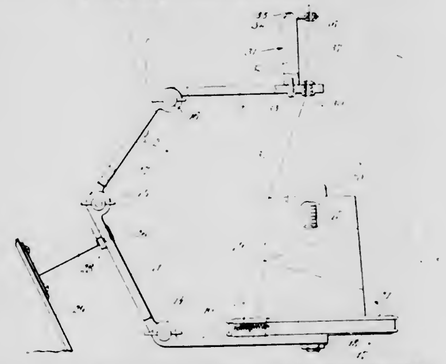
GRANTED MAY 14, 1935

2,000,897
BUILDING CONSTRUCTION
Frank H. Alcott, Jamaica, N. Y.
Application January 5, 1933, Serial No. 650,227
5 Claims. (Cl. 20—1)



1. A building construction comprising a plurality of similar interlocking plank members, tongues and grooves on opposite longitudinal edges of said plank members adapted and arranged to match and fit the respective grooves and tongues of each similar adjacent member, said tongues and grooves being uniformly offset from a plane described through the middle of the edge portions of each plank, each alternate plank being reversed end for end so that the faces of adjacent members are out of alignment, and means extending through said longitudinal edges rigidly connecting said members together.

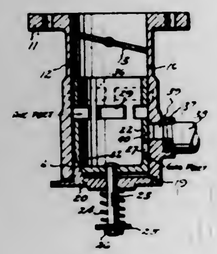
2,000,898
GARMENT
Eleanor Donaldson, Minneapolis, Minn.
Application November 10, 1932, Serial No. 641,961
3 Claims. (Cl. 2—226)



1. An undergarment for women having leg portions and a continuous unbroken close-fitting waist portion, said garment being made of one material which has an appreciable stretch in one direction but comparatively little stretch in a direction at right angles thereto, said garment having the material at the waist portion extending unbrokenly from one side of the garment to the other side, said material at the front being stretchable from side to side, said garment at the rear portion having said material extending unbrokenly from the crotch to the top of said garment and stretchable up and down, whereby said material at the rear will stretch to accommodate bending forwardly and the material at the waist will stretch to permit entry into said garment.

2,000,899
AUTOMATIC CONTROL MECHANISM FOR ELECTRIC MOTORS
Augustus C. Durdin, Jr., Chicago, Ill., assignor to Chicago Pump Company, Chicago, Ill., a corporation of Illinois
Application February 17, 1930, Serial No. 429,047
23 Claims. (Cl. 172—239)

20. In combination, two electric motors, circuits therefor, sequentially operable electric switches for controlling said circuits, a double throw switch having contacts in the circuits for the two motors, and electro-magnetic mechanism for actuating said double throw switch, said electro-magnetic mechanism having two coils, each in series with an associated electric switch.



2,000,900
YARN SUPPORT
Carl Epps, Rome, Ga., assignor to Tubize Chatillon Corporation, a corporation of Delaware
Application February 24, 1934, Serial No. 712,748
3 Claims. (Cl. 242—130)

3. A yarn support comprising an adjustable-position link bracket having a supporting link securable to an auxiliary support, a link at one

side of said supporting link adapted to support a spindle, a ballooning link at the other side of said supporting bracket, all of said links being adjustably connected and capable of swinging in substantially the same horizontal plane, a yarn guide carried by the ballooning link, a tension device carried by the ballooning link, said tension device also including a yarn guide, and the yarn guide of the tension device being located further from the supporting link than the yarn guide of the ballooning link.

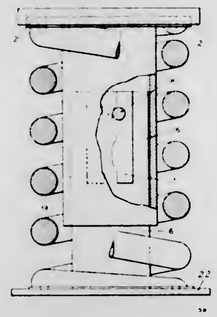
2,000,901
GAS MIXER
Sam P. Jones, Dallas, Tex., assignor of forty per cent to E. W. Schadek, Dallas, Tex.
Application February 19, 1934, Serial No. 711,954
6 Claims. (Cl. 48—180)

1. A gas mixer comprising, a housing having gas and air inlets, a piston loosely slidable in said housing and having gas and air inlets located to register with the inlets of the housing when the piston is slid in said housing, and means for shifting the loose piston laterally of the vertical axis of the housing to seal off the gas inlets when the piston is moved to a closed position.

2,000,902
FURNITURE PAD
Alfred C. Korte, St. Louis, Mo., assignor to Metalcraft Corporation, St. Louis, Mo., a corporation of Missouri
Application February 27, 1933, Serial No. 658,848
5 Claims. (Cl. 45—137)

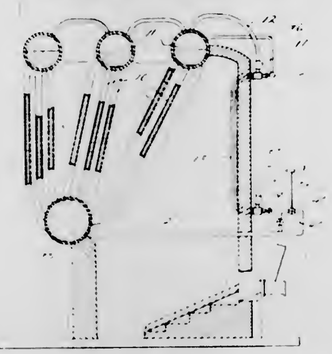
1. In a device of the class described, a furniture leg in the form of a sheet metal tube, a pair of integral parallel projections at one end of said tube, opposite perforations in said projections, a section of rubber tubing located between said projections and having the opening therein registering with said perforations, and a pintle mounted in said perforations and passing thru the opening in said section of rubber tubing.

2,000,903
DIESEL ENGINE
Willy Lehmann, Eichwalde, near Berlin, Germany, assignor to Heinrich Kamper Motorenfabrik Aktiengesellschaft, Berlin-Marienfelde, Germany
Application February 20, 1934, Serial No. 712,185
In Germany March 12, 1932
4 Claims. (Cl. 123—182)



1. In a Diesel engine, the combination of a main compression chamber, an admission valve, an exhaust valve and actuating mechanism for said exhaust valve with an additional compression chamber in communication with the main compression chamber and having a supply inlet for admitting a starting fuel, a change-over valve for closing the communication between the main and additional compression chambers, operating means for moving the change-over valve into and out of the closing position and actuating mechanism for the admission valve including an actuating member adjustable from an operative position to an inoperative position and adjusting means for said actuating member operatively connected to the operating means for the change-over valve for moving the said actuating member into the inoperative position on the change-over valve being moved into the open position and into the operative position after the change-over valve has been moved into the closing position, so as to prevent the admission valve opening while the main and additional compression chambers are in communication with one another.

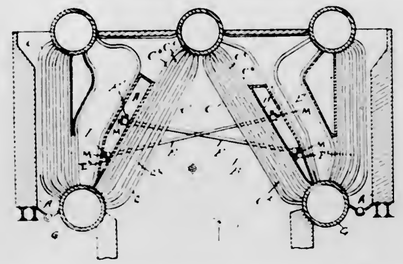
2,000,904
ROTARY-WINGED AIRCRAFT
Joseph S. Pecker, Philadelphia, Pa., assignor to Autogiro Company of America, Philadelphia, Pa., a corporation of Delaware
Application January 4, 1932, Serial No. 584,641
Renewed July 23, 1934
46 Claims. (Cl. 244—19)



1. In a rotative-wing aircraft, a rotor, a rotor-starter unit, a driving connection for transmitting power from said unit to the rotor, and a replaceable adapter device, cooperating in such manner that different conditions imposed by the rotor construction may be compensated for by replacement of the adapter device.

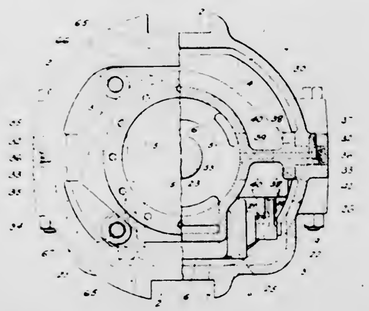
2,000,905
HELICAL SPRING
John W. Rockefeller, Jr., New York, N. Y.
Application September 1, 1933, Serial No. 687,749
9 Claims. (Cl. 267—1)

1. A helical spring in combination with means for automatically torquing and untorquing same as the spring is progressively deflected axially.



2,000,906
METHOD OF AND APPARATUS FOR SUPERHEATING
Charles S. Turner, Detroit, Mich.
Application January 31, 1931, Serial No. 512,675
21 Claims. (Cl. 122—479)

16. In combination with a furnace and a steam boiler, a water regulated tubular superheater assembly exposed to direct radiation within the furnace and comprising a plurality of longitudinal generally parallel cooling fluid conduits arranged around a similarly extending contained area and having component wall portions exposed to radiation within the furnace, and a steam conduit portion lying at least partially within such contained area and metallically integral with said cooling conduits throughout substantially their entire effective heat-absorbing length.



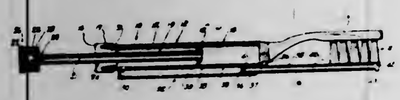
18. The method of controlling superheating action in a superheater structure consisting of separate metallic superheater and cooling water tubes arranged at an angle to the horizontal within a zone of heating and in heat interchanging relation to each other throughout substantially their entire effective heat-absorbing length, which comprises supplying steam and water to the respective tubes, throttling the water supply below the evaporative capacity of the tubes whereby the water will assume a level within the tubes, and raising or lowering such level in accordance with increase or decrease respectively in the temperature of the superheated steam.

2,000,907
SUPERHEATER ASSEMBLY
Charles S. Turner, Detroit, Mich.
Application February 1, 1932, Serial No. 590,108
Renewed October 6, 1934
7 Claims. (Cl. 122—473)

5. In combination with a steam boiler having walls defining a passage through which heated gases of combustion pass, regulatable steam superheating means comprising separate metallic steam and water conduits extending across said passage at an angle relatively to the horizontal and in close proximity, and integral metallic heat bridging portions connecting said steam and water conduits.

2,000,908
POWER HAMMER
Campbell V. Adams, Chicago, Ill.
Original application February 4, 1931, Serial No. 513,269. Divided and this application July 29, 1932, Serial No. 625,755
11 Claims. (Cl. 61—76)

1. In a power hammer, the combination with a multi-part housing, a cylinder, a piston therefor and a ram connected to said piston, all of which are disposed within said housing, diametrically-opposed outwardly-extending flanges on said cylinder adapted to be clamped between adjoining edges of said housing parts for supporting said cylinder within said housing, and means for securing said cylinder in clamping relation between adjoining edges of said housing parts, said securing means fastening said cylinder and one



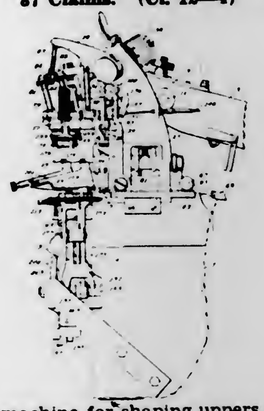
of said housing parts individually together whereby the other housing part may be removed to provide access to the interior of said housing without detaching said cylinder.

2,000,909
METHOD OF MAKING SELF-CLEANING CONTACTS
Alfred Alsaker, Chicago, Ill., assignor to The Delta Star Electric Company, Chicago, Ill., a corporation of Illinois
Original application October 5, 1927, Serial No. 224,969. Divided and this application April 15, 1929, Serial No. 355,067
5 Claims. (Cl. 29—155.55)

1. The method of making a terminal member and securing it to a lead, consisting in inserting a portion of the lead into a suitable length of tubing, then flattening the tubing upon the lead under sufficient pressure to force it into intimate contact with the lead and to cause the tubing to permanently grip and retain said lead, and shaping the terminal member to provide an angularly disposed guide element.

2,000,910
AUTOMATIC TOOTHBRUSH PASTE FEEDER
Harry A. Appel, New York, and Emile Le Blanc, Woodside, N. Y.
Application November 14, 1933, Serial No. 697,882
20 Claims. (Cl. 15—137)

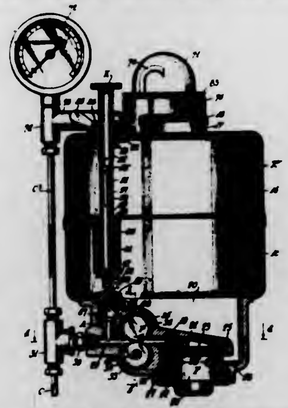
1. A brush having a handle, a head thereon having cleaning means, said handle having means including a chamber, and a member having piston coaction with said means for expression of material from the chamber, said member having communication with the chamber along a limited portion of the path of the member to cause a limited quantity of the material to be expressed from the chamber, and means coacting with said member and being movable along the cleaning means to supply thereto the material expressed from said chamber.



2,000,911
PLANT SUPPORT
William E. Balousek, Chicago, Ill., assignor to W. J. Dennis & Company, Chicago, Ill., a corporation of Illinois
Application April 3, 1933, Serial No. 664,154
3 Claims. (Cl. 47—47)

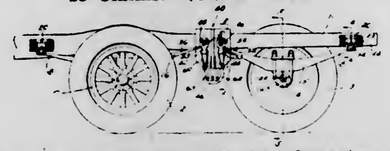
1. A plant support comprising a tubular stake having a slot along one side thereof, a strip of material arranged and frictionally held within said stake, a plurality of apertures provided in said stake in a manner whereby the strip when detached may be extended through the apertures desired and provide an arrangement which may be varied in accordance with the kind of plant to

be supported, and a label for identifying the plant slidably adjustable in said slot.



2,000,912
MACHINE FOR SHAPING SHOE UPPERS
Arthur Bates, Leicester, England, assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application September 11, 1933, Serial No. 688,885
In Great Britain October 22, 1932
87 Claims. (Cl. 12—4)

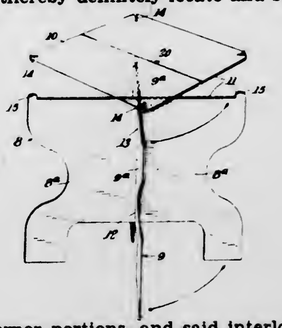
1. In a machine for shaping uppers over lasts, the combination with end-embracing wipers movable lengthwise and widthwise of a last to wipe the marginal portion of an upper around an end of the last into lasted position, of mechanism constructed and arranged to engage a binder extending around the end of the upper and movable relatively to said wipers to force the binder against the marginal portion of the upper in the course of the operative movement of the wipers.



2,000,913
LUBRICATION OF MACHINERY
Joseph Bijur, New York, N. Y., assignor to Auto Research Corporation, a corporation of Delaware
Application May 5, 1930, Serial No. 449,764
18 Claims. (Cl. 184—7)

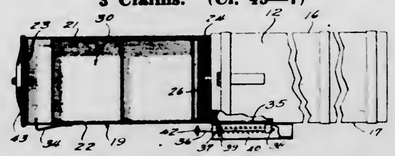
1. A lubricating system including in combination a central lubricant reservoir, a system of distributing conduits having invariant flow restricting outlets at the bearings to be lubricated, rated for uniformly proportional lubricant distribution at all rates of flow, a continuously operating pump

for forcing lubricant into the distributing system, and adjustable means for predetermining the absolute rate of flow of lubricant through the outlets, and means to indicate variations in the predetermined absolute flow rate.



2,000,914
EQUALIZING ATTACHMENT FOR TRUCKS
Ira E. Blair, Los Angeles, Calif.
Application November 20, 1931, Serial No. 576,348
Renewed August 20, 1934
15 Claims. (Cl. 280—104)

1. Spring mechanism of the character described, including: a chassis member; a pair of springs in end-to-end relationship; means for securing the outer ends of said springs to said chassis member; and a load distributor secured to said chassis in proximity to the adjacent ends of said springs, said load distributor including shackles on said adjacent ends of said springs having cable-receiving bars, cable loops extending over said cable-receiving bars, and a pulley member rotatably secured to said chassis, the ends of said cable loops being secured to peripheral portions of said pulley member at unequal distances from the axis of rotation thereof so as to transmit unequal loads to said adjacent ends of said springs.

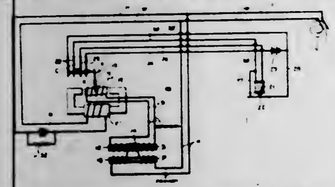


2,000,915
KNOCKDOWN FURNITURE
Valerie F. Blake, New York, N. Y.
Application January 31, 1933, Serial No. 654,408
2 Claims. (Cl. 311—79)

1. A table or the like, comprising folding base members slotted inward from opposite ends and having hinging scores extending from the inner ends of the slots therein, whereby when interlocked by endwise engagement, separated portions of one base member will come opposite and be located by scored portions in the face of the other base member and a folding top member having an intermediate hinging score, said folding top member being supported by said base members and having interlocking engagement at its edges with the outer corner portions of the base members, to thereby definitely locate and secure said

outer corner portions, and said interlocking engagement between the edges of the folding top member and outer corner portions of the base members also holding said folding top member in its spread open position, wherein it holds the folding base members fixedly spaced in spread open relation.

2,000,916
ASH TRAY AND THE LIKE
Arvid S. Bloom, Lompoc, Calif.
Application May 12, 1934, Serial No. 725,374
3 Claims. (Cl. 45—7)



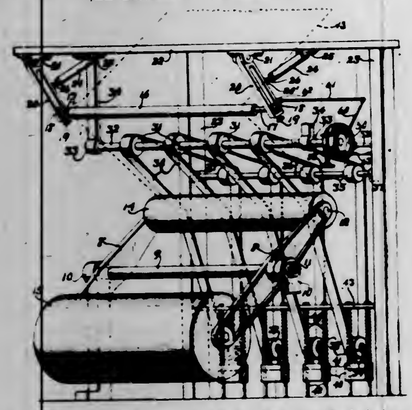
1. A fireproof receptacle for smoker's accessories and the like, which comprises a rectangular sheet metal housing opened at one end and adapted to be embodied within the structure of an article of furniture, a sheet metal drawer slidably mounted within said housing having a floor, parallel side walls and a front wall, a partition wall within the drawer at a point intermediate its ends, a rod extending rearwardly therefrom, a tube telescoping over said rod, a spring holding said tube in its distended position with its rear end projecting beyond the rear end of the drawer to engage the end wall of the housing, and latch means holding the drawer in its closed position and compressing said spring to move the drawer to an opened position when the latch is released.

2,000,917
TRAIN CONTROL SYSTEM
Theodore Bodde, Niagara Falls, N. Y., assignor, by mesne assignments, to General Railway Signal Company, Rochester, N. Y., a corporation of New York
Application October 30, 1926, Serial No. 145,192
34 Claims. (Cl. 246—63)

1. In combination, vehicle carried apparatus including a source of energy, a vehicle carried inductor means including inductively coupled coils operable through said source of energy for producing either of two operating conditions in said apparatus, one operating condition being effected

upon a reduction of the normal transmission of energy between the inductively coupled coils; and a single roadside inductor cooperating with said vehicle carried inductor means, said roadside in-

ductor embodying a circuit devoid of an energy source and operative when closed for influencing the vehicle carried coupled inductor coils to produce the other of said two operating conditions in the vehicle carried apparatus.



2,000,918

TENSION CONTROL MEANS

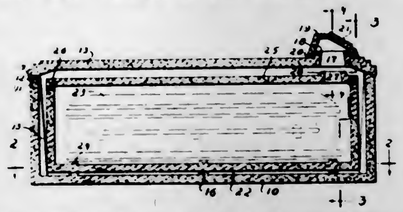
Arthur W. Broms, Chicago, Ill.

Application February 23, 1932, Serial No. 594,523

11 Claims. (Cl. 242—75)

1. Tension control means for material traveling from a roll, comprising belt means mounted to have an arced contact with the roll and to be driven thereby, rotary means for supporting said belt means, brake means adjustably applicable to one of said rotary means for retarding its movement and the movement of said belt means to a predetermined extent, for maintaining an even tension in the material, and other brake means connected to said adjustable brake means for automatically stopping the travel of said belt means and roll upon tearing of the material.

2,000,919



BURIAL VAULT

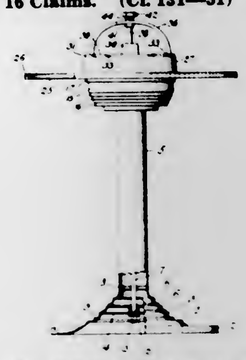
Charles O. A. Brunk, Detroit, Mich., assignor to Memorial Mausoleum Corporation, Detroit, Mich., a corporation of Delaware

Application July 30, 1932, Serial No. 627,053

8 Claims. (Cl. 72—7)

1. A burial vault structure comprising a closed receptacle adapted to be placed in the ground and having an upwardly projecting stack portion communicating with the interior of the receptacle but exposable to the air above ground, an inner receptacle within the first mentioned receptacle, means for positioning the inner receptacle within the outer in such manner as to permit air circulation between them and about all sides of the inner receptacle, and means within the

inner receptacle to support a casket therein in such manner as to permit circulation of air about all sides thereof.



2,000,920

SMOKING STAND

William J. Campbell, Indianapolis, Ind., assignor to Climax Machinery Company, Indianapolis, Ind., a corporation of Indiana

Application November 16, 1934, Serial No. 753,260

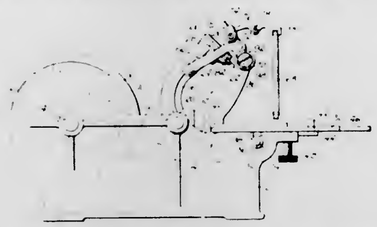
16 Claims. (Cl. 131—51)

1. In an ash receiver, a housing, a receptacle removably positioned within said housing, said receptacle having a central upwardly extending tube, a cover for said housing including a downwardly and inwardly inclined hopper the lower aperture of which is vertically aligned with the open top of said receptacle and which depends to a horizontal plane lower than the top of said tube, a handle for said cover, a guide extending downwardly from said handle through said tube and into a lower portion of the housing, a locking connection between said guide and the lower portion of the housing and a closure movable on said guide, said closure being normally gravitationally seated against a lower portion of said housing.

2,000,921

MARKING MACHINE

Frank C. Choice, Leicester, England, assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey



Application October 26, 1932, Serial No. 639,601

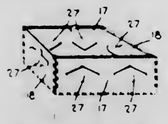
In Great Britain November 4, 1931

12 Claims. (Cl. 33—4)

1. A machine for operating upon soles having, in combination, a work support, an operating tool arranged for movement toward and away from said work support, sole-end-engaging means for positioning a sole longitudinally, and means engaging the sole adjacent to the toe end only at

one side and adjacent to the heel end only at the other side for positioning the sole with its longi-

tudinal median line at an angle to the operating tool.



2,000,922

MANUFACTURE OF DISPLAY CARDS, CONTAINERS, AND THE LIKE WITH RAISED FIGURES

Clifford C. Church, Needham, Mass.

Application November 21, 1932, Serial No. 643,692

9 Claims. (Cl. 93—36)

1. The method of making a sheet with raised figures on it which consists in making through-and-through cuts in a sheet along the entire outline of the desired figures thereby to cut said figures entirely free from the sheet but without displacing them from the sheet and with the cuts in the sheet having the same relative position therein as the desired relative position of the raised figures in the finished product and subsequently transferring the previously cut out figures simultaneously from said sheet onto and securing them to another sheet and maintaining the original relative position of the figures during such transfer and attachment to said other sheet by means other than the first-named sheet.

2,000,923

SLEEVE HOLDER

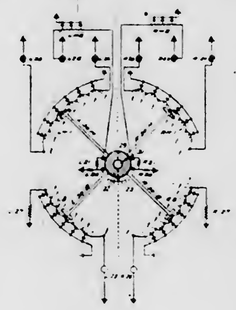
Almond L. Colbiornsen, Belgrade, Minn.

Application January 20, 1934, Serial No. 707,519

17 Claims. (Cl. 24—15)

1. A sleeve holder for use with the sleeve of a garment having the cuff folded back upon the sleeve, said sleeve holder comprising a member for engagement in the bight of the folded part of the sleeve and means for holding the holder attached to the sleeve.

2,000,924



BINAURAL ELECTRIC COMPENSATOR

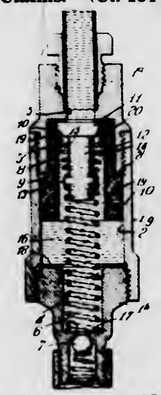
Roger B. Colton and Harold C. Mabbott, Fort H. G. Wright, N. Y.

Application October 6, 1930, Serial No. 486,734

3 Claims. (Cl. 177—386)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

2. An electrical compensator adapted for use with a plurality of receivers of wave energy, said receivers being arranged in at least two groups and including phase comparing devices operative therewith; means for transmitting the energy from each group of said receivers to each of said phase comparing devices, comprising successive groups of lag lines, each lag line consisting of inductances and capacitances; and means interposed between each group of lag lines and the following lag line, comprising series and shunt resistances forming with each succeeding lag line a network having the reciprocal of its surge impedance equal to the sum of the reciprocals of the surge impedances of the preceding group of lag lines.

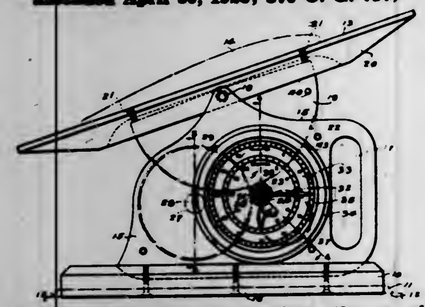


2,000,925

LUBRICANT DISCHARGE VALVE FOR FORCEFEED LUBRICATING SYSTEMS

Irving Cowles, Detroit, Mich., assignor to Union Bank of Chicago, Chicago, Ill., a corporation of Illinois, as trustee

Application August 26, 1929, Serial No. 388,323



17 Claims. (Cl. 184—7)

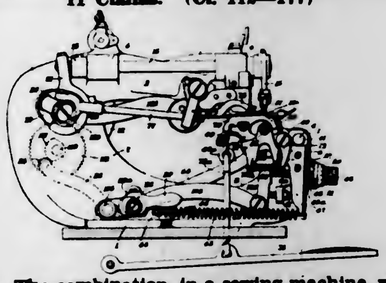
1. A valve of the type specified comprising a casing having a cylindrical bore and provided at opposite ends with intake and discharge ports,

a hollow piston reciprocable in said casing and provided with a passage for fluid therethrough, a valve seat bordering one end of said passage and being opposed to the intake port of the casing, a valve controlling said passage and adapted to seat on said valve seat, a spring arranged to maintain said valve normally closed, a second and more powerful spring arranged to maintain said valve open during absence of fluid pressure thereon counter to said spring and to maintain said piston normally at the intake end of said casing, the end wall of the latter bordering the intake port thereof constituting a stop limiting the travel of said valve under the influence of the more powerful spring to thereby cause the first-mentioned spring to seat said valve, and an annular shoulder in the discharge end portion of said casing on which said piston is adapted to seat to interrupt flow of lubricant from the discharge port of said casing as said piston is actuated against the action of the more powerful spring by fluid under pressure entering the intake port of said casing.

2,000,926
PROTRACTOR
Lee G. Cox, Pensacola, Fla.
Application March 22, 1933, Serial No. 662,110
6 Claims. (Cl. 33—75)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a protractor for checking the angular setting of propeller blades within their respective hub sockets while mounted upon a test stand, in combination, a base plate adapted to slide upon the stand, side plates projecting from said base plate, a blade engaging arm adapted to contact with the face of a propeller blade, said arm having a centrally located pivot pin located in bearings in said side plates, a toothed sector plate adjustably mounted with respect to said arm and projecting between said side plates, a dial graduated to degrees and minutes located exteriorly of one of said side plates, a plurality of pointers for said dial, a chain of ratio gearing between the shafts of said pointers and said sector plate, and manually operated means for imparting a rocking motion to said arm.

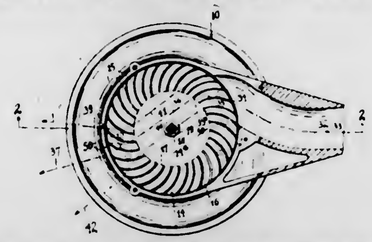
2,000,927
PLASTIC COMPOSITION AND METHOD OF WORKING THE SAME
Kenneth H. Crutchfield, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application January 16, 1930, Serial No. 421,310
15 Claims. (Cl. 18—57)



1. Method of rendering compositions containing derivatives of cellulose more plastic comprising incorporating and retaining in said compositions a suitable hydroxy-carboxylic acid adapted to increase the plasticity thereof.

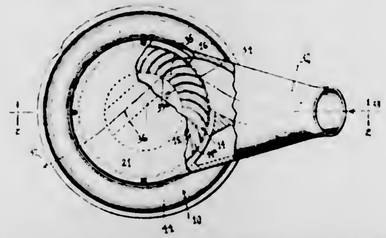
2,000,928
BAG AND METHOD OF MAKING SAME
Robert N. Cundall, Hamburg, and William B. Powell, Buffalo, N. Y., assignors, by mesne assignments, to Bagpak, Inc., a corporation of Delaware
Application January 10, 1931, Serial No. 507,874
18 Claims. (Cl. 229—62)

5. A multiple walled bag, comprising a multiple walled tubular body made of flexible material and having a mouth at at least one side, the outer wall of said bag being slit inwardly from the mouth at diametrically opposite places to points below the mouth of said inner wall and said outer wall between said slits being extended to form two outwardly projecting flaps, fastenings extending through the opposite sides of an inner wall to form a closure for the mouth of said inner wall, a hardening plastic material securing one of said flaps over the mouth of said inner wall and forming a seal for said mouth and also for each end of the holes made in said inner wall by the penetration of said fastenings, and additional hardening plastic material securing the other flap over said first flap.



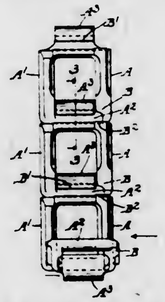
2,000,929
WORK SUPPORTING MEANS FOR SEWING MACHINES
Charles A. Dearborn, New York, N. Y., assignor to American Blind Stitch Machine Company, New York, N. Y., a corporation of New York
Application December 7, 1933, Serial No. 701,297
11 Claims. (Cl. 112—177)

1. The combination, in a sewing machine, with a driving shaft, a yielding work support carrying a ridge forming member, and suitable work feeding and stitch forming mechanisms, of a work controlling member in engagement with said work support, operating mechanism between said shaft and said member, and means for disengaging said operating mechanism from said shaft and holding it against movement.



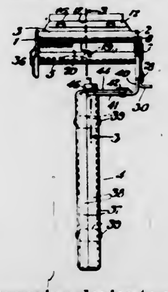
2,000,930
AIR MOTOR
Bela De Nagy, New York, N. Y.
Application February 17, 1934, Serial No. 711,637
5 Claims. (Cl. 253—134)

1. In combination, a housing having annular side walls; a partition wall integral with the side walls and dividing the housing into a closed upper and a downwardly open lower compartment; a shaft revoluble in the axis of said housing; a rotor located in the upper compartment and locked to said shaft; the walls of said upper compartment being provided with intake and outlet air passages; means in the partition wall for permitting exhaustion of air from the lower chamber and



means for driving an operating device received in said lower chamber when the rotor is operated said rotor having curved vanes leaving a free space around the center thereof to permit an air stream to pass from the inlet through a portion of the vanes then through the central space and then through the vanes at a second portion of the rotor.

2,000,931
ALTERNATING ACTION POLISHING MACHINE
Bela De Nagy, New York, N. Y.
Application March 24, 1934, Serial No. 717,243
5 Claims. (Cl. 15—49)

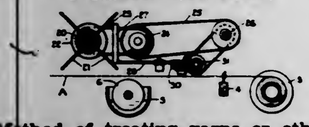


1. In a brushing and polishing machine, a first set of elements for brushing operations; a second set of elements to be used for polishing operations, and means to simultaneously move said first elements into an active operative position and said second elements into an inactive position, of vice versa, said means including a frame structure for said machine, each element being arranged in said frame adapted to move upwardly or downwardly therein to a limited extent; a wedge carried by each element, tapering in the direction of the upward movement thereof, a movable wedge in said frame for each element tapering in the direction of the downward movement of said element, the tapering surfaces of each two respective wedges being adapted to engage each other in a gradually increasing manner and thereby to cause the respective element to gradually move in a downward direction; means to move one set of wedges in the frame into increasing engagement with the wedges on the respective elements and to simultaneously move the other set of frame wedges into decreasing engagement with the wedges on the respective other elements, so as to cause one set of elements to move downwardly and permit the other set of elements to move upwardly, and means to automatically cause said other set of elements to move upwardly when said frame wedges are moved as described.

2,000,932
CHAIN LINK
Peter K. Dewar, Indianapolis, Ind., assignor to Link-Belt Company, Chicago, Ill., a corporation of Illinois
Application January 8, 1934, Serial No. 705,665
10 Claims. (Cl. 74—249)

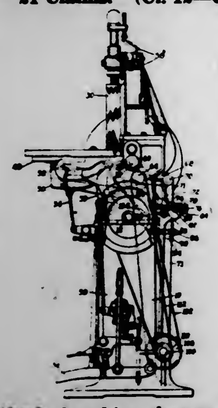
9. In a link for chain belts and the like comprising side bars, a pintle bar and a hook, a projecting portion associated with the hook having a relatively sharp edge and offset with respect to said hook, the distance between such edge and the opposed face of the hook being substantially the same as the thickness of the side bar adjacent the pintle bar.

2,000,933
STROPPING DEVICE
Samuel H. Drake, Groton, N. Y.
Application March 11, 1933, Serial No. 660,347
6 Claims. (Cl. 51—153)



1. A blade stropping device to reciprocate along a strop, comprising a frame; a blade holder pivotally supported by the frame to rock a supported blade into engagement with the strop at opposite sides of the pivot axis of the holder; driving means engageable with the strop and operatively connected to the blade holder to rock the latter as the device is reciprocated along the strop; and means independent of said driving means to automatically rock the blade away from the strop upon reversal of movement of the device along the strop and comprising a lever pivotally supported intermediate its ends by the frame and having portions at opposite sides of its pivot engageable by the blade holder near the limits of its rocking movement toward the strop to rock said lever, and a spring to yieldably resist rocking of the lever.

2,000,934
TREATMENT OF CELLULOSE ESTERS
Camille Dreyfus, New York, N. Y., and Leslie N. Lee, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application February 26, 1929, Serial No. 342,932
10 Claims. (Cl. 260—102)

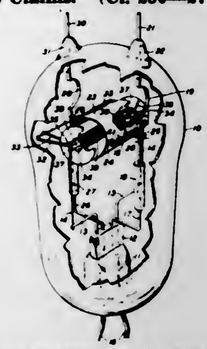


1. Method of preparing an organic ester of cellulose of high resistance to heat comprising esterifying cellulose in an esterifying bath containing sufficient non-solvent for the cellulose ester to be formed so that the same does not enter into solution, mechanically separating the cellulose ester formed, and treating the same while in solid form with a solution of an oxygen-containing acid having a dissociation constant greater than 1.0×10^{-2}, at a temperature substantially that of the boiling point of the solution.

2,000,935
TREATMENT OF TEXTILE MATERIALS
Camille Dreyfus, New York, N. Y., and William Whitehead, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
Application October 28, 1931, Serial No. 571,582
3 Claims. (Cl. 8—20)

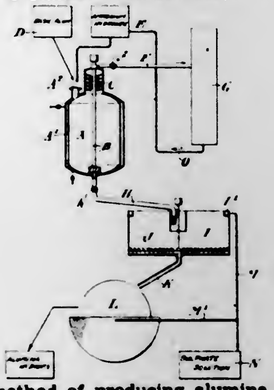
1. Method of treating yarns or other textile material which comprises applying to yarn or textile material, while it is travelling, at continuously and progressively varying intervals a substance adapted to modify the properties thereof.

2,000,936
METHOD OF AND MACHINE FOR PERFORMING OPERATIONS UPON SHOE PARTS
René E. Duplessis, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application September 8, 1933, Serial No. 688,644
21 Claims. (Cl. 12—61)



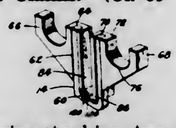
1. A method of making shoe parts and the like which consists in pressing a work piece into a matrix, skiving the work piece to a form determined by the matrix, and buffing the exposed surface of the work piece while the work piece is still in the matrix.

2,000,937
COMPOSITE REACTION PRODUCT
Carleton Ellis, Montclair, N. J., assignor to Ellis-Foster Company, a corporation of New Jersey
No Drawing. Application August 17, 1927, Serial No. 213,695
10 Claims. (Cl. 260—3)



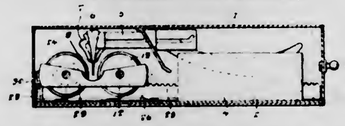
1. A resinous complex consisting of the reaction products of Congo resin, ordinary rosin, phthalic anhydride and glycerol, in combining proportions.

2,000,938
ELECTRON DISCHARGE DEVICE
Clifford E. Fay, South Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application May 12, 1933, Serial No. 670,692
9 Claims. (Cl. 250—27.5)



1. An electrode assembly for electron discharge devices, comprising a pair of spaced metallic cylindrical members, a plurality of wires extending between and secured at their ends to said members, said wires constituting an electrode, metallic discs of relatively large area adjacent said cylindrical members, and a plurality of members of high thermal conductivity connecting said discs to said cylindrical members.

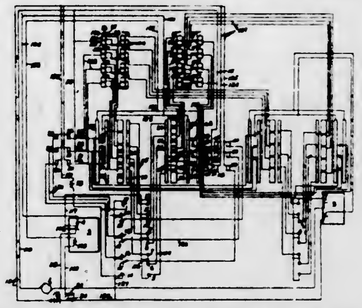
2,000,939
MANUFACTURE OF ALUMINA HYDRATE
Arthur Fleischer, Hartford, Conn., assignor to Kalunite Company, Philadelphia, Pa., a corporation of Delaware
Application July 7, 1933, Serial No. 679,309
3 Claims. (Cl. 23—143)



1. The method of producing alumina hydrate which consists in treating in a closed container a suspension of finely divided basic alum in ammonium hydroxide containing ammonia in excess of the amount equivalent to the sulphur trioxide component combined with alumina in basic alum at temperatures above 60° C. to effect the decomposition of the basic alum with formation of insoluble alumina hydrate and a solution of ammonium sulphate and alkali metal sulphate if alkali metal sulphates exist in the basic alum and of ammonia in solution, then driving off from said solution the uncombined ammonia held in solution therein and recovering said ammonia by condensation and absorption and finally separating the alumina hydrate from the ammonia free sulphate solution.

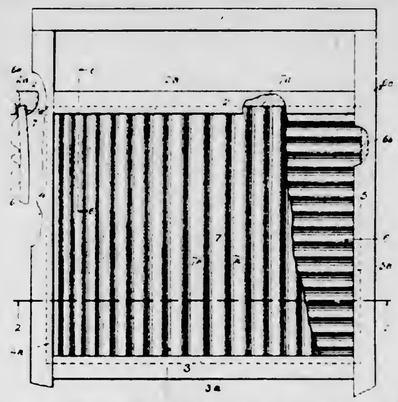
2,000,940
EDGING MACHINE
Joseph Fossa, Salem, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application June 9, 1934, Serial No. 729,847
8 Claims. (Cl. 69—1)

1. In an edging machine, two current carrying conductors, a substantially U-shaped tool, lugs having grooves to receive the legs of said tool and in tight frictional engagement with these legs, and means for clamping the lugs respectively one to each conductor.



2,000,941
RAZOR BLADE SHARPENING DEVICE
Robert L. Gardner and Roy D. Lloyd, Pittsburgh, Pa.
Application December 27, 1933, Serial No. 704,168
8 Claims. (Cl. 51—86)

1. A sharpening device comprising a support, a slide mounted to said support for movement in opposite directions, a holder pivoted to the support and receiving and frictionally gripping a blade and adapted for oscillatory movement, sharpening rollers mounted to the support for rotation and sliding movements endwise relative to the blade and each having honing and stropping surfaces, means between said sharpening rollers and said holder whereby movement of the slide in opposite directions imparts rotation to the rollers, means for sliding the rollers endwise in opposite directions during the rotation of the latter, and means for intermittently engaging the blade first with the honing surfaces and then with the stropping surfaces of said rollers.

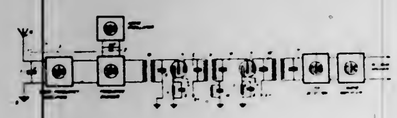


2,000,942
ELEVATOR SIGNALING SYSTEM
Robert H. Gaylord, Los Angeles, Calif.
Application April 6, 1932, Serial No. 603,459
9 Claims. (Cl. 177—336)

1. In an elevator signal system for a plurality of cars, individual landing signals for the cars, signal circuits for the respective cars, car controlled switch means individual to said cars for completing the landing signal circuit for the corresponding car, and means operable upon the establishment of any one of the landing signal circuits to

open all other landing signal circuits for that landing and to maintain said other circuits open during the time such first circuit is maintained established.

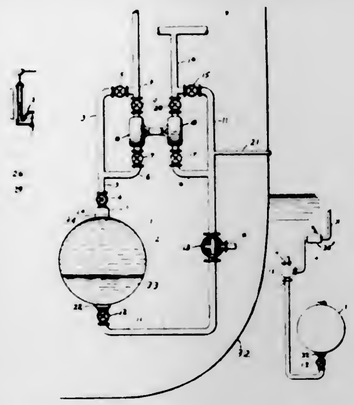
2,000,943
WASHBOARD
Charles T. Gilbert, Saginaw, Mich., assignor to National Washboard Company, Chicago, Ill., a corporation of West Virginia
Application December 8, 1934, Serial No. 756,649
4 Claims. (Cl. 68—29)



2. In a washboard having a frame with interiorly grooved rails and legs, in combination, a sheet corrugated to present arrises and channels extending throughout its length in the direction of rubbing, the ends of said arrises being engaged in the grooves of said rails, the arrises near the middle of the sheet being deeper than those at the edges thereof, a second sheet corrugated to present arrises and channels extending throughout its width crosswise of the direction of rubbing and having the ends of its corrugations received in the leg grooves, and mid-area of said second corrugated sheet being in back-to-back engagement with the middle arrises of the first sheet and having the ends of its corrugations in bearing engagement with the walls of the grooves in the legs whereby the said second sheet is kept in a resiliently stressed condition and slightly bowed over the said middle arrises of the first mentioned sheet.

2,000,944
REFRIGERATOR ARTICLE RECEPTACLE
Harold H. Gilbert, Mount Clemens, and John R. Replogle, Detroit, Mich., assignors, by mesne assignments, to Copeland Refrigeration Corporation, Mount Clemens, Mich., a corporation of Michigan
Application January 11, 1932, Serial No. 585,890
1 Claim. (Cl. 312—173)

A refrigerator comprising an insulated cabinet having a door opening, a door for said opening, an article container comprising upper and lower frame members secured on the inside of said door, and a pan having flanged edges supported on the lower one of said frame members and providing a bottom closure member for said container.



2,000,945
RECEIVER DETECTOR CONTROL
David Grimes, Dongan Hills, Staten Island, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application June 12, 1931, Serial No. 543,857
13 Claims. (Cl. 250—20)

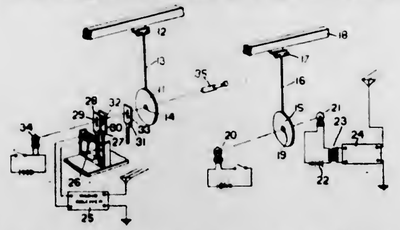
1. In combination with a superheterodyne receiver including an intermediate frequency amplifier consisting of an electron discharge tube provided with a grid circuit tuned to a desired intermediate frequency, means in the cathode circuit of said tube for biasing the grid of said intermediate amplifier tube, and additional means in the grid circuit of said tube for increasing the bias on the grid when surging positive with strong signals.

2,000,946
APPARATUS FOR DISPENSING INFLAMMABLE FLUIDS
Clyde M. Hamblin, Washington, D. C.
Application March 2, 1934, Serial No. 713,760
11 Claims. (Cl. 221—67)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. An apparatus for dispensing inflammable fluids, comprising a container, a conduit leading from the top of said container, a conduit leading from the bottom of said container, means to draw the fluids through said first conduit and means in said second conduit operated by the velocity head

of the fluid passing therethrough to drive said first mentioned means.

2,000,947
THRUST SCREW CONNECTER
Adalbert Hauser, New York, N. Y.
Application November 18, 1933, Serial No. 698,616
19 Claims. (Cl. 221—60)



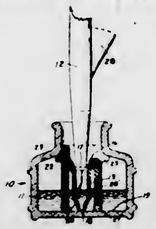
1. A mechanical connecter comprising a male and a coacting female member, one of said members having a resilient spring loop fixed thereabout, the other of said members having an inclined ridge of such diameter as in the application of said elements to depress the spring member out of the path of the rigid member, the element carrying said spring member having a backing portion for the latter to retain the same against displacement from the inclined rigid member in any relative rotary movement of the parts, whereby the elements can be assembled by a direct thrust and subsequently tightened or removed by a rotary movement.

2,000,948
APPARATUS FOR DETERMINING THE FORCE OF GRAVITY
Harvey C. Hayes, Washington, D. C.
Application August 16, 1927, Serial No. 213,427
1 Claim. (Cl. 265—1)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

In apparatus for determining the gravitational constant at a desired point, a gravity sensitive pendulum located at said point, radio receiving devices adjacent said pendulum and adapted to receive pendulum controlled signals transmitted from a point at which the gravitational constant is known, means provided with an opening and controlled by said radio receiving devices, said

pendulum being provided with an opening adapted to be aligned with said first mentioned open-

ing, and means for determining when said openings are in alignment.



2,000,949
FOOT ARCH SUPPORT
Julius Heller, Neunkirchen, Austria, assignor to firm Schrauben- und Schmiedewaarenfabriks-Actiengesellschaft Brevillier & Co. und A. Urban & Soehne, Vienna, Austria, a company of Austria
Application February 24, 1933, Serial No. 658,395
In Austria March 2, 1932
4 Claims. (Cl. 36—71)

1. A foot arch support comprising plate means, supporting springs connected with said plate means, means for adjusting the tension of the said supporting springs, said last named means including an element adapted to turn, means in permanent engagement with said element for limiting the turning of said element in one direction to a predetermined limit by engagement with said plate means.

2,000,950
SELF-FILLING FOUNTAIN PEN FILLING DEVICE
Henry C. Hitt, Bremerton, Wash.
Application February 15, 1934, Serial No. 711,379
8 Claims. (Cl. 120—4)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

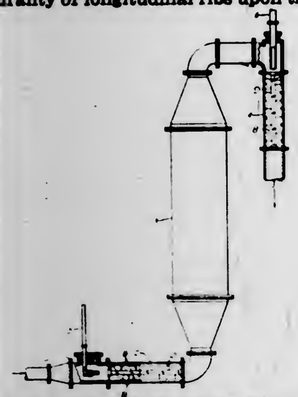
1. An adapter for an ink container, comprising a support within the ink container resting on the bottom thereof and of larger diameter near its upper end than the neck of the ink container, and an impervious hollow member attached to said support and extending adjacent the bottom of said container, said larger diameter portion of the support contacting under the throat of the ink container providing a substantially secure

contact between the throat and bottom of the container.

2,000,951
LUBRICATED CORDAGE
Walter D. Hodson, Chicago, Ill.
Application September 17, 1934, Serial No. 744,426
7 Claims. (Cl. 117—53)

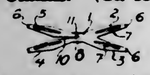
1. Cordage comprising relatively unabsorbent fibrous rope strands having a finely divided fibrous material of markedly higher lubricant-absorbing powers than the rope fibres loosely permeated throughout the interstices of the rope strands and having a lubricant distributed throughout said rope strands and absorbent fibrous material.

2,000,952
WIRE ROPE
Walter D. Hodson, Chicago, Ill.
Application October 10, 1932, Serial No. 637,007
4 Claims. (Cl. 117—59)



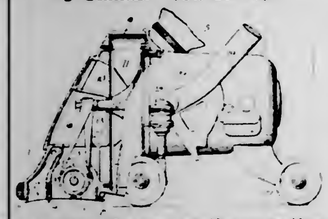
1. A wire rope comprising a plurality of strands of wire wound about and pressing upon a fibrous core, said core comprising fibrous rope strands having a finely divided fibrous material having markedly higher lubricant absorbing powers than the rope fibres loosely permeated throughout the interstices of the rope strands and having a lubricant distributed throughout said core and absorbent fibrous material.

2,000,953
MEANS FOR REACTING SEMIFLUID MATERIALS
Paul Hooker, Thomas L. B. Lyster, and John D. Rue, Niagara Falls, N. Y., assignors to Hooker Electrochemical Company, New York, N. Y., a corporation of New York
Application October 30, 1933, Serial No. 695,876
6 Claims. (Cl. 259—4)



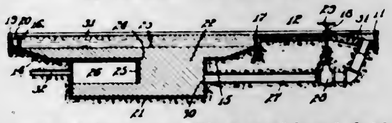
1. In a system for contacting a reagent with a stream of semi-fluid material flowing in a closed

cylindrical conduit, a mixing device comprising a helical baffle wound around a shaft and coaxially disposed within said conduit, in combination with a plurality of collars upon said shaft and a plurality of longitudinal ribs upon the inner



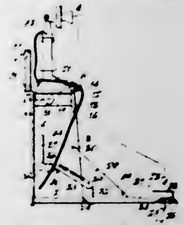
face of said conduit, said collars and ribs projecting into the path of flow defined by said helical baffle, whereby inner layers of said material are continuously moved outward and outer layers are continuously moved inward.

2,000,954
BAIT CLIP
Alva Elmer Hopkins, Tacoma, Wash.
Application October 17, 1932, Serial No. 638,117
12 Claims. (Cl. 43—40)



1. A live-bait clip for use with fishing lines, for securing thereto live bait or the like, comprising a pliable metal device adapted to be bent into U-shape to engage opposite sides of a piece of bait, and formed with two legs at each side, a tip on each leg directed inwardly when the device is bent in U-shape, and means at the bend to engage and hold the line, by movement transversely of the length of the line.

2,000,955
SUCTION CLEANER
Willis F. Hudson, Riverside, Ill., assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application December 23, 1933, Serial No. 703,687
5 Claims. (Cl. 15—8)



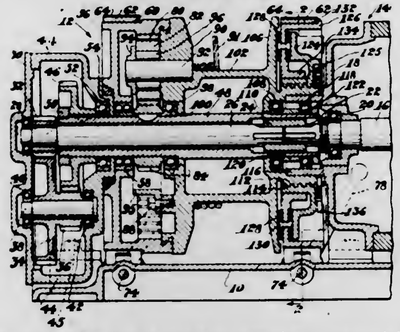
1. In a suction cleaner, suction-creating means, a first nozzle, a second nozzle, an agitator in said second nozzle, said suction-creating means functioning to draw air from said nozzles in the operation of the cleaner, a common lip between said nozzles movably mounted, and means resiliently urging said lip into contact with the surface covering with a force of the magnitude of the force exerted by the suction-lifted surface covering which it contacts.

2,000,956
METHOD OF AND APPARATUS FOR CLEANING, STERILIZING, AND SMOOTHING BEACHES
Frank B. Hunter, Indianapolis, Ind.
Application October 19, 1931, Serial No. 569,683
13 Claims. (Cl. 4—172)

1. The combination with a sand beach laid on a substantially waterproof base, of means for introducing liquid to said beach at a point below the surface of the sand, and means for withdrawing said liquid from said beach from a point below the surface of the sand.

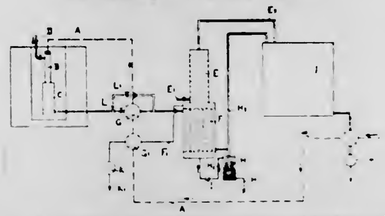
2,000,957
COMBINATION TELEPHONE STAND AND TELEPHONE DIRECTORY SECRETARY
John G. Hunter, Columbus, Ohio
Application November 1, 1932, Serial No. 640,716
7 Claims. (Cl. 45—6)

1. A secretary having a chambered body provided with a door hingedly connected at its bottom edge to the body, a brace to hold the door when opened in an approximately horizontal plane, a leaf hingedly mounted at its lower edge on the door and a baffle stop located within the body by which the leaf is deflected upwardly and away from the back of the body as the door is closed.



2,000,958
AUTOMATIC SACKING AND WEIGHING APPARATUS
René Jarrier, St.-Quentin, France, assignor to Bartlett Arkell, New York, N. Y.
Application May 1, 1928, Serial No. 274,329
In France May 20, 1927
9 Claims. (Cl. 249—60)

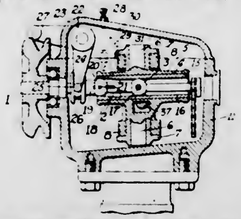
1. A machine for the automatic sacking and weighing of materials in a divided state, comprising in combination weighing means, means for conveying the material to be sacked, means operatively connected to said weighing means for automatically stopping said conveying means when a given weight of material has been sacked,



a rolling truck, a platform pivoted to said truck about a substantially horizontal axis and means for fastening said platform in the horizontal position and releasing the same at will and supporting means upon said platform for maintaining the sacks in the sacking position.

2,000,959
BRAKING MECHANISM
Francis A. Jimerson, Athens, Pa., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application July 17, 1930, Serial No. 468,531
2 Claims. (Cl. 188—82)

1. A brake for a rotary member, comprising non-rotary friction means adjacent the rotary member and movable longitudinally with respect thereto, a clamping member threaded to the rotary member and being movable longitudinally of the rotary member and the friction means to prevent retarding frictional engagement between the clamping member and the friction means, and a spiral spring connected to the members and being subjected to tension during rotation of the members and acting upon cessation of rotation of the members to effect frictional locking engagement between the friction means and both members.



2,000,960
PROCESS AND APPARATUS FOR THE TREATMENT OF HEAVY OILS
Alfred Joseph, Enghien, France, assignor, by mesne assignments, to Houdry Process Corporation, Dover, Del., a corporation of Delaware
Application December 11, 1930, Serial No. 501,691
In France November 14, 1930
13 Claims. (Cl. 196—52)

1. In a process for the treatment of heavy oils, the steps of mixing the oil to be treated with steam, vaporizing the oil, cracking the vaporized oil in the presence of a catalyst, condensing the steam and cracked vaporized oil, separating the condensed water vapor from the oil condensate, utilizing the heat liberated during condensation of the cracked vaporized mixture for revaporizing a part of the oil condensate, mixing the revaporized oil with steam in restricted predetermined amount, and dephlegmating said last named mixture.

5. In the production and catalytic refining of low boiling hydrocarbons suitable for motor fuel such as gasoline from high boiling hydrocarbons in definite converting and refining zones the process steps which comprise converting the high boiling hydrocarbons in the presence of steam, condensing the resulting products, separating the fixed gases from the condensate and passing them directly to the refining zone, separating the condensate into water and hydrocarbons, revaporizing at least a part of the hydrocarbons by heat exchange with the products of the converting zone, fractionating the revaporized hydrocarbons in the presence of a small quantity of steam, and conducting the fractionated vapors to the refining zone.

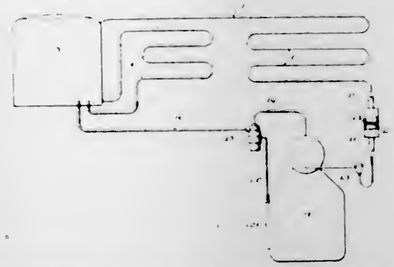
2,000,961
FINISHING MACHINE
Frank Bycroft Keall, Leicester, England, assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 2, 1932, Serial No. 645,447
In Great Britain December 7, 1931
30 Claims. (Cl. 12—78)

1. In an edge setting machine, an oscillating tool shaft carrying an edge setting tool, a rotatable drive shaft, a member the axis of which is normally oblique to the axis of the drive shaft mounted on said shaft to rotate therewith and for angular adjustment with respect thereto, connections between said member and the tool shaft for oscillating the latter as the drive shaft is rotated, and means for angularly adjusting the said member with respect to the drive shaft.

2,000,962
CAN OR JAR OPENER
Franz K. Krag, Chicago, Ill.
Application August 13, 1932, Serial No. 628,661
3 Claims. (Cl. 81—3.1)

1. A can opener comprising a handle having a rack thereon, a clamping jaw fixed to the handle, a second clamping jaw slidably mounted on the handle, a lever pivotally associated with the second jaw, and a pawl pivotally connected to the lever and adapted to coact with the rack to prevent separation of the jaws, the lever and pawl forming a toggle-joint connection between the second jaw and the rack, the pawl comprising a U-shaped member with its ends pivoted to the lever and resiliently pressing against the lever adjacent the pivoted point.

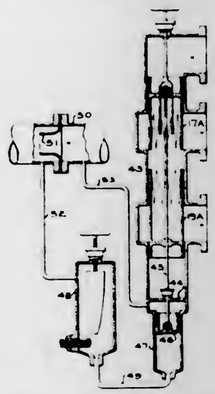
2,000,963
OUTSOLE REMOVING MACHINE
Axel A. Lawson, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 5, 1932, Serial No. 645,716
22 Claims. (Cl. 12—1)



1. In a machine for operating upon shoes, guiding means adapted to be inserted between a sole and a shoe bottom, and means for separating the sole from the shoe bottom as the marginal portion of the shoe bottom is progressively presented thereto, said last-mentioned means having surfaces which converge to form a cutting edge, that surface adjacent to the shoe bottom extending at an angle to the direction of the feed movement of the shoe.

2,000,964
PROCESS OF POLYMERIZING MONO-OLEFINES
Samuel Lenher, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 27, 1933, Serial No. 653,831
10 Claims. (Cl. 260—170)

1. A process of polymerizing mono-olefines to form mono-olefines of a greater molecular weight, which comprises heating a mono-olefine having less than 10 carbon atoms under a temperature of 400°–700° C. while admixed with oxygen of a concentration of between about 0.5% and 5% based on the olefine.

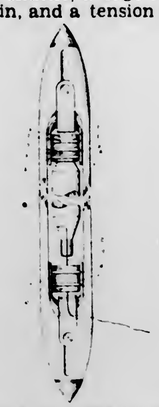


2,000,965
REFRIGERATING SYSTEM
Carl E. L. Lipman, Chicago, Ill., assignor to Lipman Patents Corporation, Chicago, Ill., a corporation of Delaware
Application May 8, 1933, Serial No. 669,908
2 Claims. (Cl. 62—115)

2. A refrigerating system comprising a continuously operating compressor, a condenser, an evaporator of the flooded type located to receive refrigerant by gravity from the condenser, pipe lines connecting said compressor, evaporator and condenser to form a closed refrigerant circuit, means in the line between the condenser and evaporator for restricting the flow of refrigerant to the evaporator during refrigerant circulating periods while permitting the contents of the condenser to collect by gravity in the evaporator during non-circulating periods, means for preventing back flow of collected refrigerant from the evaporator to the condenser, and means for

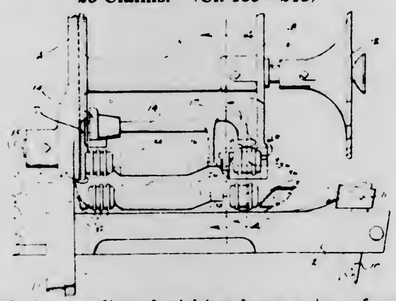
automatically shutting off the suction line between the compressor and evaporator to initiate a non-circulating period upon the development of a predetermined temperature in the evaporator.

2,000,966
REGULATING VALVE
Charles E. Lucke, New York, N. Y., assignor to Bailey Meter Company, a corporation of Delaware
Application November 17, 1931, Serial No. 575,604
7 Claims. (Cl. 137—166)



1. A fluid regulating valve, comprising a casing from which flowing fluid passes through a plurality of outlets, valve means in said casing for proportioning the flowing fluid to said outlets, and automatic means for varying said proportionality, said automatic means responsive to a measure of the total flow of fluid through said casing.

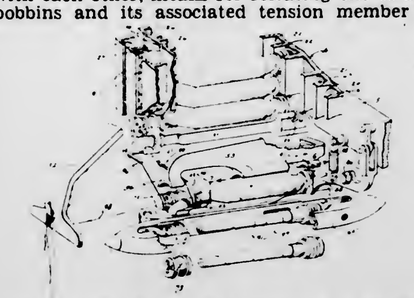
2,000,967
LOOM SHUTTLE STRUCTURE
William E. Lundgren, Auburn, Mass., assignor, by mesne assignments, of one-half to Sutton Tool Co., Inc., Wilkinsonville, Mass., a corporation of Massachusetts
Application April 7, 1933, Serial No. 664,854
28 Claims. (Cl. 139—207)



1. In a loom shuttle of the type employed in replenishing looms, a resilient bobbin holding means, a bobbin directly supported by said holding means for automatic insertion within or

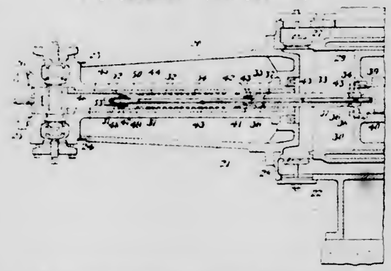
ejection from said shuttle, a cage removably secured to said bobbin, and a tension member car-

ried by said cage and mounted in operative relation with said bobbin.



2,000,968
WEFT REPLENISHING LOOM
William E. Lundgren, Auburn, Mass., assignor, by mesne assignments, of one-half to Sutton Tool Co., Inc., Wilkinsonville, Mass., a corporation of Massachusetts
Application May 26, 1933, Serial No. 672,935
25 Claims. (Cl. 139—246)

23. In a weft replenishing loom, a transferable bobbin of the conventional ring base type provided with a fixed spindle, a tension device adapted for operative association with said bobbin, a shuttle, means for supporting said bobbin and tension device in replenishable position with relation to said shuttle with the tension device located outwardly of and in spaced relation with the bobbin spindle, and means engaging said bobbin and tension device substantially simultaneously for effecting their transfer to the shuttle while maintained in longitudinally spaced relation with each other during the transfer.

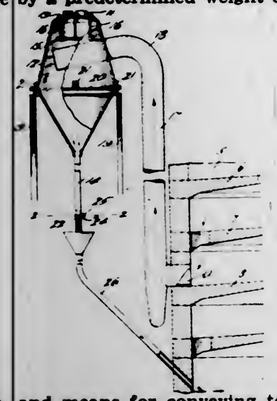


2,000,969
WEFT REPLENISHING LOOM STRUCTURE
William E. Lundgren, Auburn, Mass., assignor, by mesne assignments, of one-half to Sutton Tool Co., Inc., Wilkinsonville, Mass., a corporation of Massachusetts
Application May 26, 1933, Serial No. 672,936
13 Claims. (Cl. 139—258)

1. In a weft replenishing loom of the stationary magazine type, a shuttle, a plurality of transferable bobbins and separate tension members, means for supporting each bobbin and its associated tension member in axial alignment with each other while the several bobbins and tension members are supported in superposed relation with each other, means for releasing one of said bobbins and its associated tension member to

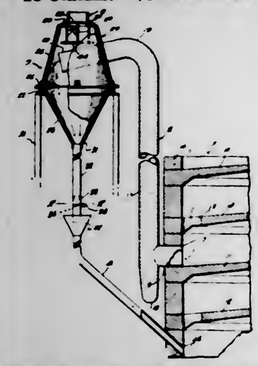
permit movement of said bobbin and its associated tension member into position for transfer while retaining them in operative relationship with each other, and means for transferring said bobbin and its associated tension member to the shuttle substantially simultaneously.

2,000,970
PISTON ASSEMBLY
Raymond C. McAllister, Painted Post, N. Y., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application November 15, 1934, Serial No. 753,129
6 Claims. (Cl. 309—4)



1. A piston assembly, comprising a plurality of pistons arranged in tandem, a spacer interposed between adjacent pistons to transmit the movement of one piston to another, cooperating spherical surfaces on the spacer and adjacent pistons to permit of relative angular disalignment of the pistons, and means connected to adjacent pistons to maintain the spherical surfaces in contacting relationship with each other.

2,000,971
COLLECTOR FOR FULLER'S EARTH
Bert Manross, Warren, Pa.
Application November 4, 1930, Serial No. 493,457
6 Claims. (Cl. 183—85)



1. A collector for interpolation between a drier and its stack comprising a casing having an inverted conical lower portion and a dome-like upper portion provided with a stack connecting opening, a baffle beneath the stack opening, a pipe leading from the drier, a downwardly angular portion on the pipe passing through one side of the casing to a point near the opposite side of the casing below the baffle, a particle receiving conduit depending from the

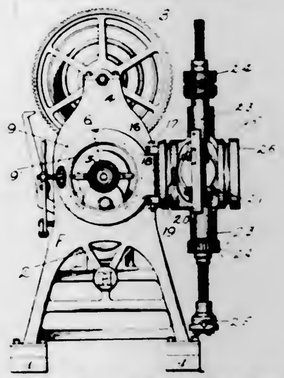
lower portion of the casing, a valve in the conduit openable by a predetermined weight of particles

thereon, and means for conveying to the drier particles which have passed the valve.

2,000,972
REVIVIFIER
Bert Manross, Warren, Pa.
Original application November 4, 1930, Serial No. 493,457. Divided and this application January 23, 1933, Serial No. 653,147
13 Claims. (Cl. 263—26)

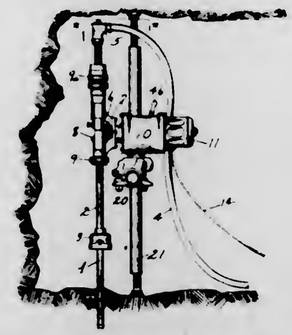
7. In a fuller's earth revivifying apparatus including a particle separating and collecting device, and a multiple hearth revivifying furnace, a stack communicating with the interior of the furnace between two adjacent upper ones of the hearths of the furnace and with said device, a separated particle returning conduit leading from said device and communicating with the interior of the furnace at a point between two adjacent lower ones of the hearths.

2,000,973
REVIVIFYING FULLER'S EARTH
Bert Manross, Warren, Pa.
No Drawing. Original application November 4, 1930, Serial No. 493,457. Divided and this application January 23, 1933, Serial No. 653,148
8 Claims. (Cl. 252—2)



1. In a process of separating and collecting both the heavier and the lighter particles of fuller's earth entrained in gaseous products of combustion of a fuller's earth revivifying furnace, the steps of confining said products while hot in a manner to permit the same to rise by natural draft to a higher level at a sufficiently high temperature to prevent the occurrence of condensation in said products, then directing the risen products downwardly from said level so that they flow in a declining course, confining air so as to produce a dead air space into which the declining products flow whereby gravitational separation of said fuller's earth particles from said products takes place, and collecting the separated fuller's earth particles as they fall through said dead air space, while permitting said products to escape, the air confined in said dead air space being heated by the incoming products and particles to a sufficiently high temperature to obviate the occurrence of condensation therein and in the collected particles and whereby packing of the collected fuller's earth particles is positively prevented.

2,000,974
TRAFFIC BUFFER
Andrew W. Mead, Seattle, Wash.
Application May 25, 1934, Serial No. 727,567
4 Claims. (Cl. 256—1)

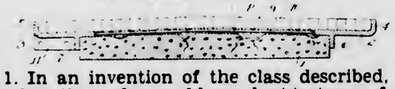


1. The combination with safety zone traffic obstructions of a traffic buffer comprising a single stationary member arranged in alignment with and adapted to shield the safety zone obstructions, a movable member arranged to slidably move into the stationary member, and yielding means interposed between the stationary and movable members that is adapted to restrain slidable movement of the movable member with respect to the stationary member.

2,000,975
RIG FOR ROTARY DRILLS
William J. Mitchell, San Francisco, Calif., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey
Application June 28, 1933, Serial No. 678,014
3 Claims. (Cl. 255—19)

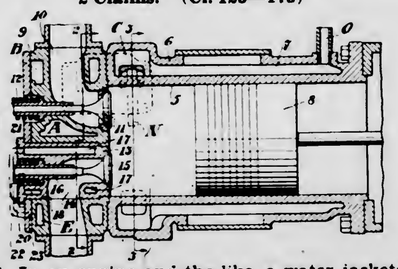
1. In a drill rig the combination with a supporting frame having a bearing ring, a swivel head mounted in said bearing ring and a face flange on said swivel head engaging one side of the bearing ring, a detachable retaining ring on the swivel-head engaging the other side of the bearing ring, a drill-head hinged on the swivel-head, and detachable fastening means for said drill-head and swivel head.

2,000,976
ROTARY DRILLING MACHINE
William J. Mitchell, San Francisco, Calif., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey
Application July 24, 1933, Serial No. 681,864
13 Claims. (Cl. 255—53)



1. In a drilling machine, the combination with a transmission case, a motor rigidly attached at one end of the case and a motor shaft, of a drill head and a swivel connection between said drill head and the other end of the case, a drive shaft alined with the motor shaft and disposed as the axis for the swivel connection, variable speed transmission mechanism between the motor shaft and the drive shaft and operating means in the drill head actuated by said drive shaft.

2,000,977
MEANS OF RESURFACING CONCRETE PAVEMENT
William H. Moseley, Springfield, Ill., assignor of one-tenth to Samuel W. Banning, trustee, Chicago, Ill.
Continuation of application Serial No. 494,743, November 10, 1930. This application August 2, 1933. Serial No. 683,283
3 Claims. (Cl. 94—4)

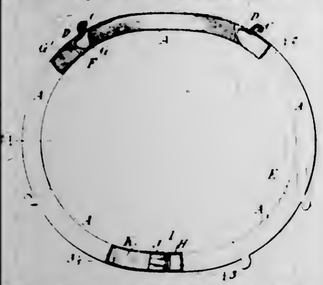


1. In an invention of the class described, the combination of an old road structure of integrally massed hard materials presenting substantially vertical side edges and a top surface presenting irregularities in contour due to disintegration of the surface, longitudinally extending vertically standing rigid side plates on each side of the old road structure presenting their lower margins in flatwise contact and close abutment with the side edges of the old road structure, said plates extending upwardly above the old road structure, a newly laid smooth surfaced layer of road surfacing materials overlying the old road structure and filling in the inequalities in the surface thereof and confined between the upstanding side plates and constituting a new road surface, and means for anchoring the side plates against lateral displacement under pressure.

2,000,978
MEANS FOR RESURFACING AND WIDENING ROAD STRUCTURES
William H. Moseley, Springfield, Ill., assignor of one-tenth to Samuel W. Banning, trustee, Chicago, Ill.
Continuation of application Serial No. 478,001, August 27, 1930. This application August 2, 1933. Serial No. 683,284
10 Claims. (Cl. 94—4)

1. In an invention of the class described, the combination of an old road structure of integrally massed hard materials presenting at its sides substantially plane vertical edges, metallic extension plates extending longitudinally along each of the edges of the old road structure and comprising in each instance a substantially horizontal body portion having its inner margin overlapping and resting upon the horizontal marginal surface of the old road structure and supported thereby and the remainder of the body extending outwardly from the old road structure and provided at its outer edge with an upturned marginal flange, each of the extension plates further having an intermediately disposed downwardly extending vertical flange abutting against the proximate plane vertical edge of the old road structure, means for anchoring the extension plates against lateral displacement and new surfacing material extending in uninterrupted condition over the surface of the old road structure and over the bodies of the extension plates and up to the outer marginal flanges thereof.

2,000,979
WATER JACKET CONSTRUCTION FOR ENGINES
Mortimer S. Parkhill and Charles W. Taylor, Corning, N. Y., assignors to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application July 12, 1932, Serial No. 622,090
2 Claims. (Cl. 123—173)



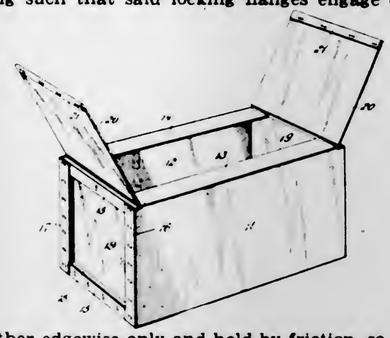
1. In an engine and the like, a water jacketed cylinder, a head therefor having inlet and exhaust passages, a connection for introducing cooling water from supply into the head adjacent the exhaust passage, there being a passage in the head for conveying all the water successively around the exhaust passage and the inlet passage, and a connection for conveying the water from the vicinity of the inlet passage to the cylinder.

2,000,980
SAFETY BELT OR THE LIKE
Eugene V. Myers, East Orange, N. J.
Application November 3, 1931, Serial No. 572,755
14 Claims. (Cl. 224—5)

1. A safety belt comprising a plurality of metallic compartments provided with hinging mem-

bers at opposite ends, said hinging members being detachable only when the compartments are in a predetermined angular relation to each other which they cannot assume when the belt

is on the body of the wearer, and said hinging members comprising inter-engaging hook members connectable in such angular relation and unconnectable in other relations.

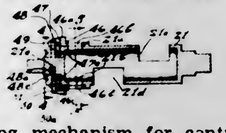


2,000,981
KITCHEN CABINET
Carl B. Parsons, Detroit, Mich.
Application July 21, 1930, Serial No. 469,290
Renewed January 18, 1933
5 Claims. (Cl. 312—141)

3. In combination with a cabinet structure of the character described, a horizontal element fixedly positioned therein, a supporting member rested upon said horizontal member, and a tray-like unit having an open front positioned upon said supporting member, the three walls of said tray-like unit being spaced inwardly from the walls of said cabinet structure and flared at the top around the periphery thereof to engage said cabinet walls.

2,000,982
REENFORCED FIBER BOARD BOX
Karl W. Petersen, Keokuk, Iowa, assignor of one-half to Iowa Fiber Box Company, Keokuk, Iowa, a corporation of Delaware, and one-half to South West Box Company, Sand Springs, Okla., a corporation of Delaware
Application November 22, 1932, Serial No. 643,900
5 Claims. (Cl. 229—23)

2. A fiber board box comprising a body and folding cover flaps hinged to the body and overlapping each other to close the top of the body; and a locking flange extending crosswise of each flap at the end, the extent of the overlapping being such that said locking flanges engage each



other edgewise only and hold by friction, so that the flaps lock when the box is completely closed.

2,000,983
CLOSURE FASTENING MEANS
Sverre Quisling, Madison, Wis., assignor to Hookless Fastener Company, Meadville, Pa., a corporation of Pennsylvania
Application October 21, 1933, Serial No. 694,669
4 Claims. (Cl. 24—205)

1. A fastener of the class described comprising a pair of flexible stringers, and cooperating rows of interlocking members on the adjacent edges of said stringers, each member comprising a piece of sheet material folded double and having parallel side edges and square corners adjacent the folded end, the folded end at one corner being closed and at the opposite corner being open to receive the closed corner of a similar member, the ends of said folded piece serving as means for attaching the member to the stringer, said member being positioned at an acute angle to the stringer edge so that said open corner projects farther from the stringer than the closed corner to permit interlocking engagement of the open and closed corners of the opposite rows of members.

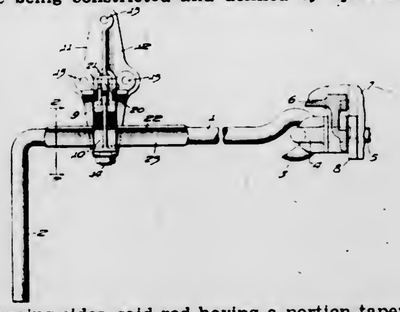
2,000,984
ROTARY FLUID DRIVEN MOTOR
Gerhardt Plato, Chicago, Ill.
Application June 15, 1931, Serial No. 544,546
3 Claims. (Cl. 137—142)

3. Governing mechanism for controlling the effective port opening of a ported cylindrical valve having continuous rotation, comprising a port controlling member rotatable with said valve and also capable of movement relatively to said valve, said valve having a portion ported to cooperate with said port controlling member, and governor mechanism rotatable with said valve, said governor mechanism comprising an arm mounted for rotation and for outward movement centrifugally, a lever pivotally supported at its

mid portion by said valve and at one end engaging said arm, operating connections between the other end of said lever and said member, and a spring opposing outward movement of said arm.

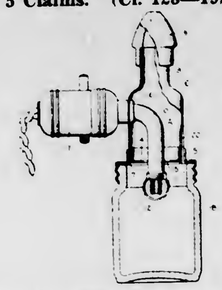
2,000,985
LIGHT MODIFYING DEVICE
Eldridge W. Quinlan and Ann Reader Quinlan, Chicago, Ill.
Application April 30, 1934, Serial No. 723,071
3 Claims. (Cl. 240—2.25)

1. In combination with a lamp, a shade therefor capable of transmitting a portion of the light, said shade having a layer thereon consisting of a light transmitting body or carrier in which is mixed and held a light reflecting pigment and an element capable of being energized so as to become a light source in itself, said pigment and said element being present in said body in proportions to render said layer translucent with respect to the radiated light.



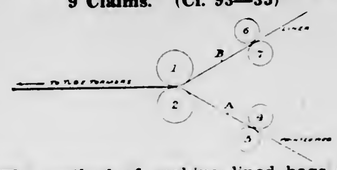
2,000,986
RECTIFIER AND FILTER CIRCUIT
Rudolf Rechnitzer, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application May 25, 1929, Serial No. 365,843
In Germany July 4, 1928
2 Claims. (Cl. 250—27)

1. In an electrical rectifying and filtering system, the combination of a source of alternating current energy, a rectifier coupled thereto for the production of unidirectional current energy, a filter system having its input side connected to said rectifier for reducing the ripple component of said unidirectional current, a utilizing circuit coupled to the output side of said filter system, and additional means comprising a resistance and a condenser in parallel for coupling said filter system to said utilizing circuit for substantially neutralizing the remaining ripple component of said unidirectional current.



2,000,987
COUPLER OPERATING MECHANISM
Willard F. Richards, Depew, N. Y., assignor to The Gould Coupler Company, New York, N. Y., a corporation of Maryland
Application April 2, 1931, Serial No. 527,262
6 Claims. (Cl. 213—171)

1. A coupler operating mechanism comprising a rotatable rod and means for supporting said rod, said means comprising a bracket adapted to be secured to a railway vehicle and a yoke mounted for rotation in said bracket about a normally vertical axis, said yoke having an aperture normally receiving said rod, the lower portion of said aperture being constricted and defined by upwardly



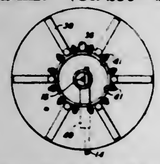
diverging sides, said rod having a portion tapering in section in a corresponding manner and adapted to snugly fit in said constricted portion of the aperture, the upper portion of said aperture being large enough to permit rotation of said rod.

2,000,988
ELECTRICAL VAPORIZER
Joseph Robinson, New York, N. Y.
Application August 19, 1927, Serial No. 214,046
Renewed April 7, 1933
5 Claims. (Cl. 128—192)

1. A device for generating vapors for inhalation, comprising in combination, a container for containing the compound to be vaporized, a heating element extending from above the compound into the latter, means for mounting the heating element on said container including means for adjusting the element in relation to the bottom of the container, and nozzle means through which the vapors generated are drawn.

2,000,989
MANUFACTURE OF BAGS
Thomas M. Royal, Philadelphia, Pa.
Application July 30, 1932, Serial No. 626,798
9 Claims. (Cl. 93—35)

1. The method of making lined bags with a smooth-edged thumb notch in one wall of the



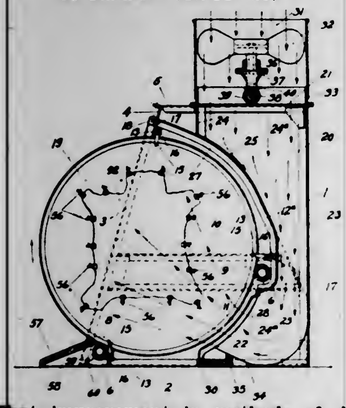
open end thereof, which consists in providing a pair of independent webs of bag material; preforming circular apertures in said webs substantially centrally of the same; bringing said webs together and in superposed relationship with one edge of each web extending beyond the adjacent edge of the other web and said apertures in registry; developing such duplex web into flattened tubular form with said registering apertures in one wall only of the same; severing such tube by straight transverse smooth-edged cuts diametrically through said registering apertures, such operation producing successive bag blanks with a notch in one wall at each end of the same, and thereafter folding and securing one end of said blanks to form a bag bottom.

2,000,990

ELECTRON DISCHARGE DEVICE

Arthur L. Samuel, Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application October 27, 1933, Serial No. 695,407
16 Claims. (Cl. 250—27.5)



2. An electron discharge device comprising an electron emitting electrode, an electron receiving electrode in juxtaposition to said first electrode, and an insulating coating on all portions of said electron receiving electrode in alignment with said first electrode.

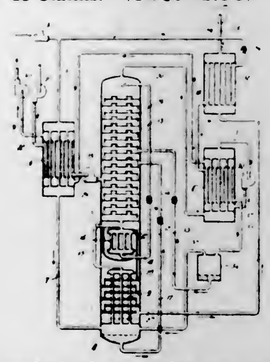
2,000,991

DRYING OF SHEET MATERIAL

Gustav Adolf Schettler, Leeds, England, assignor to The Turner Tanning Machinery Company, Portland, Maine, a corporation of Maine

Application August 25, 1932, Serial No. 630,343
In Great Britain September 4, 1931
16 Claims. (Cl. 34—28)

1. That improvement in methods of drying hides, skins, and leather which comprises arranging each hide, skin or piece of leather in a plane or flat condition, directing a current of air edgewise to the hide, skin or piece of leather so that it moves over a surface of the recited work piece from a marginal portion to central portions thereof, and causing relative rotative movement between said work piece and the current of air about the center of said work piece to treat progressively all portions of the work piece, whereby marginal portions of the hide, skin or piece of leather receive treatment for a shorter period of time than central portions thereof.



3. In a machine for use in drying of hides, skins, leather and other similar pieces of work, means to produce a current of air, means to support a piece of work in a flat condition and in a substantially vertical plane with the current of air flowing in a direction edgewise to the piece of work and in a path across a surface of the work, and means to cause relative rotation between the piece of work and the current of air while maintaining the flow of air edgewise to the work, whereby marginal portions of the piece of work are progressively treated and for a relatively limited time while central portions of the work receive considerably longer treatment by the currents of air.

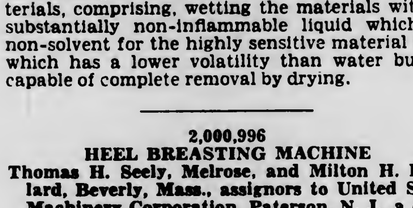
2,000,992

SEPARATION OF CONSTITUENTS OF GASEOUS MIXTURES

Joseph L. Schlitt, Stamford, Conn., assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York

Application January 31, 1934, Serial No. 709,083
18 Claims. (Cl. 62—175.5)

1. The method of separating the constituents of gaseous mixtures which comprises subjecting the compressed and cooled gaseous mixture to progressive liquefaction and rectification to separate an effluent consisting substantially of a constituent of lower boiling point, expanding the effluent from the pressure of rectification to a subatmospheric pressure and exhausting the effluent by suction.



2,000,993

AXLE AND WHEEL ALIGNER

Michael Schmidt, Junction City, Kans., assignor of one-half to C. W. Wilson, Kansas City, Mo.

Application July 14, 1932, Serial No. 622,443
6 Claims. (Cl. 33—203)

1. In an apparatus for determining angularity of the wheel spindles of a vehicle, a pair of trunnions, means for supporting the trunnions in alignment with the central termini of the spindles to establish a base line from which angularity of the spindles is determined, a gauge bar, means supporting the gauge bar in fixed transverse relation on a wheel carried by one of the spindles, gauge points adjustably mounted on the ends of the gauge bar, a stop member on the first named supporting means, by which the gauge points are adjusted to indicate a plane at right angles to the

axis of the wheel spindle, a gauge means mounted on the trunnion adjacent said gauge bar to indicate a plane at right angles to said base line, and means associated with said gauge means for indicating angular relationship of said planes.

2,000,994

SULPHONATED NAPHTHENIC ALCOHOL AND METHOD OF PREPARING THE SAME

Walther Schrauth, Berlin, Germany, assignor, by mesne assignments, to "Unichem" Chemikalien Handels A.-G., Zurich, Switzerland, a corporation of Switzerland

No Drawing. Application October 23, 1930, Serial No. 490,821. In Germany February 26, 1930
16 Claims. (Cl. 260—99.12)

1. A process for the manufacture of products resembling Turkey red oils characterized in that naphthenic acids are treated with reducing agents to produce alcohols and the alcohols are reacted with sulphonating agents to convert the alcohols into water soluble sulphonic acid derivatives.

16. A wetting-out emulsifying agent resembling Turkey red oil consisting of a mixture of sulphates and sulphonates of naphthenic alcohol.

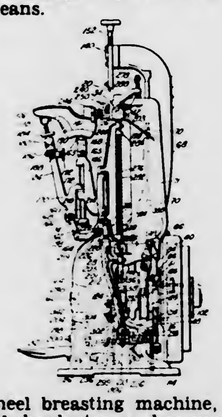
2,000,995

PROCESS OF HANDLING SENSITIVE MATERIALS

Frederick R. Seavey and Edward B. W. Kerone, Alton, Ill., assignors to Western Cartridge Company, East Alton, Ill., a corporation of Delaware

No Drawing. Application February 26, 1932, Serial No. 595,418
27 Claims. (Cl. 52—2)

1. In the art of making explosives, the process of handling normally moist highly sensitive materials, comprising, wetting the materials with a substantially non-inflammable liquid which is non-solvent for the highly sensitive material and which has a lower volatility than water but is capable of complete removal by drying.



2,000,996

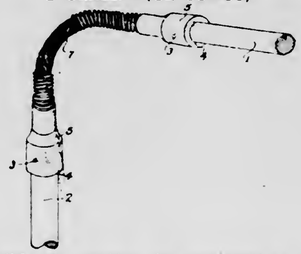
HEEL BREASTING MACHINE

Thomas H. Seely, Melrose, and Milton H. Ballard, Beverly, Mass., assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey

Application July 11, 1932, Serial No. 621,834
42 Claims. (Cl. 12—47)

1. In a heel breasting machine having a shank stop which is maintained at a fixed elevation, the combination of a breasting knife for operating upon a heel attached to a shoe on its last, a shoe supporting jack, and a jack lifting and sustaining means, said jack being movable into and out of position to be engaged by said jack lifting and sustaining means.

21. In a heel breasting machine, a breasting knife, a fixed shank stop, a shoe supporting jack movable horizontally to bring the heel of the shoe into the plane of the knife and movable vertically to bring the shoe against the shank stop, and means for maintaining the jack vertical throughout all of its shoe positioning movements.

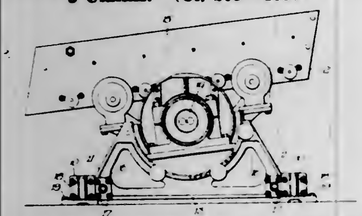


38. In a power heel breasting machine, a breasting knife, a knife slide, a clutch, and an unclutching member positioned in the path of the knife slide whereby the return of said member from inoperative position to operative position is ensured.

2,000,997

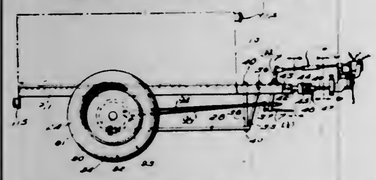
UNIVERSAL SHAFT CONNECTION

Peter F. Sharpe, Atlantic City, N. J.



Application April 13, 1932, Serial No. 604,970
1 Claim. (Cl. 64—96)

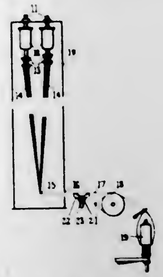
A flexible connection for connecting a driven shaft to a driving shaft embodying a cable section provided at one end with a coupling for rigidly securing that end of the cable to one of the shafts, a coupling at the other end of the cable for securing the latter end of the cable to the other shaft, said cable section comprising a fibre core extending longitudinally of the cable and formed from a plurality of closely twisted strands of fibre impregnated with a lubricant, a plurality of strands of wire all tightly twisted in the same direction around said fibre core, each of said strands comprising a wire core consisting of a bunch of strands of wire of relatively small diameter and all of circular cross section, and a plurality of wires all of circular cross section and all of a larger diameter and all tightly wrapped in the same direction with respect to one another about said wire core and in a direction opposite to the twist of the wire strands, and an envelope of resilient wire closely and tightly coiled about



the cable section in a helical direction opposite to the direction of twist of the wire strands and securely anchored at its opposite ends to the respective couplings to reinforce the cable section and tighten about the same when the shafts are rotated in a retrograde direction to preclude untwisting of the cable section.

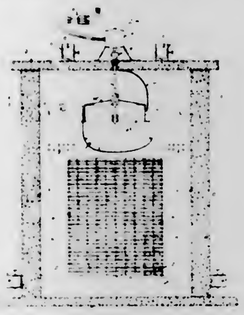
2,000,998
SCREENING APPARATUS
Lewis E. Soldan, Chicago, Ill., assignor to Productive Equipment Corporation, Chicago, Ill., a corporation of Illinois
Application February 11, 1931, Serial No. 515,029
3 Claims. (Cl. 209—409)

1. In screening apparatus, in combination, a frame having supporting legs, a screen carried by the frame, mechanical means for causing a positive vibration of the screen relative to the frame and supporting legs, shoes on the legs of the frame for rigid attachment to the floor on which the apparatus rests, and rubber members carried by the shoes and connected with the legs for supporting the weight of the apparatus with the rubber members in uncompressed condition.



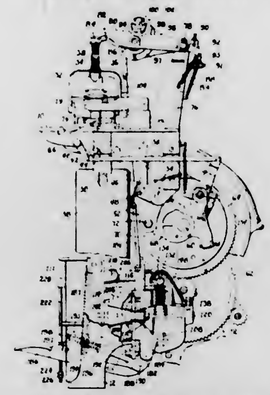
2,000,999
TRAILER
John C. Suchland, Lincoln Park, Mich.
Application July 30, 1931, Serial No. 553,920
12 Claims. (Cl. 188—112)

1. In combination with a vehicle, of a trailer having brakes, means so interconnecting the trailer and vehicle as to allow forward movement of the trailer with respect to the vehicle, said connection including a swivel connection, and means connected to the trailer rearwardly of said swivel and extending forwardly thereof for engaging the vehicle for operating the brakes.



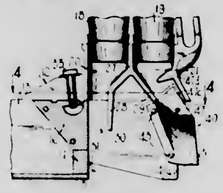
2,001,000
PRODUCTION OF ARTIFICIAL FILAMENTS, YARNS, OR THREADS
William Ivan Taylor and Leslie Brisbane Gibbins, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware
Application November 2, 1933, Serial No. 696,379
In Great Britain November 17, 1932
13 Claims. (Cl. 18—8)

1. Process for the production of artificial filaments, which comprises extruding a plurality of filaments, drawing them all at the same varying linear speed in the course of their extrusion so as to impart similar variations in denier to each filament, and associating the filaments as a thread, the length of filaments between differ-



ent spinning orifices and the point of association of filaments being different, whereby corresponding variations in denier in the different filaments occur at different places in the length of the thread.

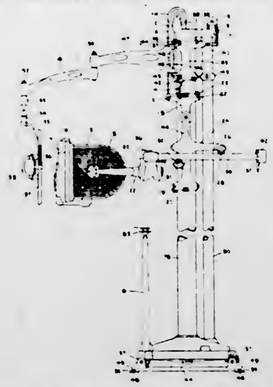
2,001,001
REVERSIBLE CIRCULATION INTERNAL FAN KILN
Rolf Thelen, Madison, Wis.; dedicated to the free use of the Public
Application November 23, 1932, Serial No. 644,010
1 Claim. (Cl. 34—46)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



In a dry kiln adapted to receive a single row of flat piled stacks of lumber, comprising a plurality of horizontal fans centrally located above the lumber; heating coils located at the side walls above the lumber; an air distributor centrally located above the lumber, extending the full length of the dry kiln and consisting of a substantially horizontal central part, provided with means for supporting said fans, and extending from a point in proximity to said heating coils on one side to a point in proximity to said heating coils on the other side of the kiln; a curved upper part extending from one edge of said central part to the dry kiln ceiling, and a curved, hinged, lower part, extending from the other edge of the central part substantially transversely across the dry kiln to a point in proximity to said coils opposite said other edge of said central part, and reversible driving means for said fans.

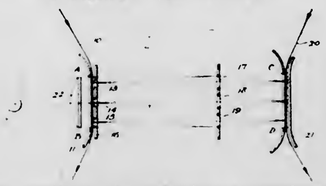
2,001,002
CEMENT SOLE-ATTACHING MACHINE
William D. Thomas, Lynnfield, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 7, 1932, Serial No. 646,156
39 Claims. (Cl. 12—33)

1. A machine for use in the manufacture of shoes having, in combination, a pad for supporting a shoe and sole, and power-operated means for pressing the shoe and sole together on the pad, said means being constructed and arranged automatically to vary the pressure substantially in accordance with the size of the shoe operated upon.



2,001,003
PLANTER AND FERTILIZER DISTRIBUTOR
Miles H. Tuft, Rock Island, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application January 16, 1933, Serial No. 651,916
13 Claims. (Cl. 111—73)

1. A fertilizer distributor comprising a pair of runners for opening a furrow and a deflecting member positioned between said runners and formed to provide downwardly, rearwardly and outwardly diverging troughs the lower ends of which terminate substantially at the rear edges of the runners for guiding the fertilizer downwardly and rearwardly against the furrow walls formed by the runners and at a point directly back of the rear edges of the runners.

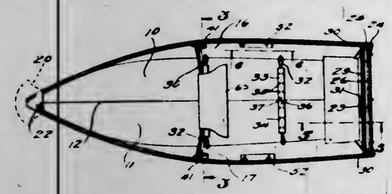


2,001,004
X-RAY TUBE HOLDER
Julius B. Wantz, Oak Park, Ill., assignor to General Electric X-Ray Corporation, Chicago, Ill., a corporation of New York
Application August 30, 1930, Serial No. 478,944
8 Claims. (Cl. 250—34)

1. X-ray apparatus comprising a base, tracks for said base and along which it is movable, means for locking said base on said tracks, a turntable on said base, standards on said turn-

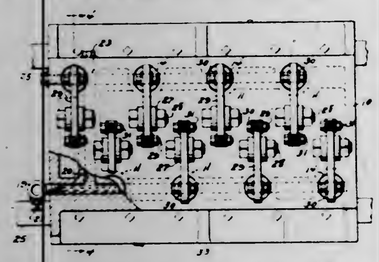
table, and X-ray apparatus of different kinds secured to one of said standards.

2,001,005
METHOD OF AND MEANS FOR RECORDING SOUND
Alfred Whitaker, West Drayton, and Cecil Oswald Browne, London, England, assignors to Electric and Musical Industries Limited, Middlesex, England, a company of Great Britain
Application June 4, 1931, Serial No. 541,980
In Great Britain June 4, 1930
6 Claims. (Cl. 88—24)



4. The method of producing a quasi-variable density linear sound record from a master linear record whereon the recorded sounds are represented by a serrated line of demarcation between two areas having differing optical characteristics, the amplitude and spacing of the serrations being functions, respectively, of the amplitude and frequency of the sounds, which comprises illuminating such a master record and projecting onto a photosensitive element a plurality of closely adjacent transversely reduced images thereof while maintaining a predetermined relation between the linear spacing of the peaks of the image serrations and the linear spacing of the peaks of the serrations on the master record.

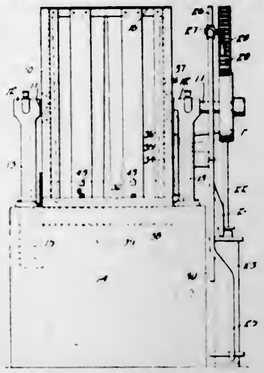
2,001,006
FOLDING BOAT
Harold F. Wilson, Los Angeles, Calif.
Application August 28, 1933, Serial No. 687,024
4 Claims. (Cl. 9—2)



1. A folding boat structure comprising a pair of flexible bottom panels lying in the same plane and substantially abutting against each other along the longitudinal center line of the boat, a flexible waterproof hinge strip disposed on the under face of said panels and being secured to overlap the joint of the contiguous edges, a pair

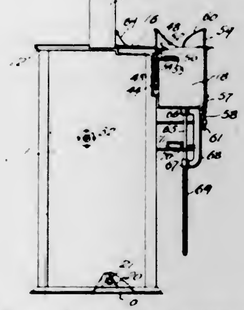
of side panels disposed at opposite sides of the bottom panels and being of a contour identical therewith whereby the side and bottom panels will flex to form a boat, waterproof hinge strips extending longitudinally of the joint formed by the outer edges of the bottom panels and the lower edges of the side panels, cross brace means adapted to hold the side panels and the bottom

panels in their unfolded positions at a point intermediate their ends, means interlocking the brace with the side panels, an end panel adapted to be positioned between the side panels at the stern of the boat, and a flexible waterproof back strip permanently secured to the side panels and the bottom panels at the stern of the boat and beyond the end panel.



2,001,007
CABLE EQUALIZER
Thomas J. Wilson, Pittsburgh, Pa.
Application June 2, 1934, Serial No. 728,767
6 Claims. (Cl. 187—1)

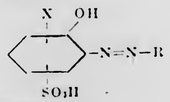
1. An equalizer of the character described comprising a casing forming a plurality of piston cylinders arranged in rows, pistons working in said cylinders, said casing having fluid passages common to the cylinders, means for supplying fluid to said passages to maintain a determined content therein, lifting means passed through the casing and fixed with respect thereto, equalizer levers pivotally supported in said lifting means and having connection with the pistons, and lifting cables having connection with said levers.



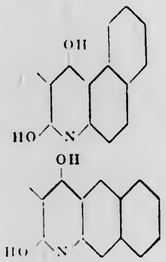
2,001,008
CAN DUMP FOR ICE MACHINES
William Henry Aubrey, Waynesboro, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Application December 2, 1932, Serial No. 645,473
11 Claims. (Cl. 62—113)

1. A device for removing ice from the container in which it is frozen comprising a cradle, means for supporting the container in the cradle, a motor for inverting the cradle to invert the container, and means operated by the cradle for causing the application of thawing fluid to the outside of the container to thaw the ice loose from the container and permit it to

drop by gravity from the container, substantially as set forth.

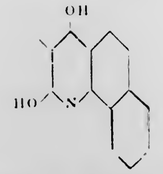


2,001,009
ENVELOPE STUFFING MACHINE
Horace C. Baker, Green Bay, Wis., assignor to Patten Paper Company, Ltd., Appleton, Wis.
Application August 20, 1931, Serial No. 558,387
8 Claims. (Cl. 93—6)



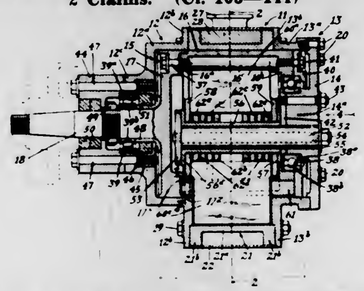
1. In a machine of the kind described, a support having a top provided with a guideway, a slidable sheet carrier in the guideway, a sheet magazine overhanging said guideway, means for singly controlling delivery of sheets from the magazine to the carrier, an envelope magazine beneath the plane of the guideway to have an uppermost envelope of a stack flush with said guideway, a plurality of swinging levers in the support and one operating the carrier, a pivoted yoke on the support and operated by another of the levers, a forwardly inclined opener finger on the yoke to engage in and open the uppermost envelope, laterally swinging sheet guides at opposite sides of the guideway and operated by another of the levers to swing into the envelope opened by said finger for directing an oncoming sheet into said envelope, a swinging frame opposite the first-named frame, and operated by another of the levers, a rearwardly directed downwardly curved envelope ejector on the last-named frame, hinged-jointed connections between the frames and guides, and the said levers, and means for actuating the levers in timed relation to each other.

2,001,010
ORTHO-HYDROXYAZO DYES
Walther Benade, Dessau in Anhalt, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application January 28, 1933, Serial No. 654,109. In Germany April 18, 1932
12 Claims. (Cl. 260—86)



1. The ortho-hydroxyazo dyes corresponding to the general formula

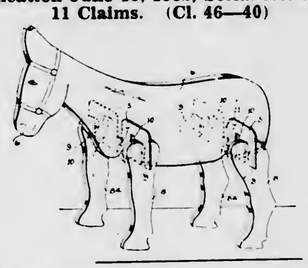
wherein R means



or

and X means hydrogen, halogen or NO_2, said dyes dyeing wool in the presence of a chromium mordant according to the single-bath process red to violet tints of good fastness to fulling and washing and excellent fastness to light.

2,001,011
PUMP OR ENGINE
Samuel Barton Brown, Los Angeles, Calif.
Application November 19, 1932, Serial No. 643,382
2 Claims. (Cl. 103—144)



1. In a rotary pump or engine of the type described, in combination, a casing; and a rotor mounted therein having an end section which is provided with an annular recess in the inner face thereof adjacent to its periphery, said rotor section being detachably secured to the remainder of the rotor and having a lip which surrounds said recess, there being a surface exterior to said lip with which it has a running fit and a series of curved seats formed in the inner side of said lip, said lip being imperforate opposite the outer sides of said seats to prevent leakage, a spindle, a plurality of rotor blades mounted upon said spindle, pins through which said rotor blades extend, and a cylindrical rotor section upon which said pins are mounted with a fluid-tight working fit, end portions of said pins being seated upon said curved seats to prevent leakage between the external and internal chambers of the structure, there being other bearing portions for said pins to cooperate with said curved seats, said other bearing portions being formed in the part of the rotor to which the aforementioned end section is detachably secured.

2,001,012
PISTON LIFT FOR PUMPING OF LIQUIDS
Everett K. Burgher, Puerto Mexico, Mexico
Application March 21, 1934, Serial No. 716,615
In Mexico November 1, 1933
12 Claims. (Cl. 103—52)

1. A labyrinth piston for the pumping of liquid from a well through a production tube by use of the pressure of gas, comprising: a plurality of labyrinthic beveled rings in end-to-end relation; and means for supporting said rings in said relation with sufficient looseness to allow said rings to adopt eccentric positions wherein they will constitute a seal between said piston and the walls of said tube.

2,001,013
WALKING TOY
Joseph Davis and Donald J. Davis, Chicago, Ill., assignors, by mesne assignments, to Walkem Corporation, Chicago, Ill., a corporation of Illinois
Application June 13, 1932, Serial No. 616,893
11 Claims. (Cl. 46—40)

1. A toy comprising a body, a plurality of legs, and a plurality of resilient hinges of flat

thin flexible material, said hinges being provided with cut-out portions for slidably and detachably mounting said body and legs on said hinges.

2,001,014

PROCESS OF PREPARING ORTHO-DIHYDROXY COMPOUNDS OF THE BENZENE SERIES

Frederick B. Downing, Carneys Point, N. J., Richard G. Clarkson, Wilmington, Del., and Harry H. Reynolds, Pennsgrove, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 10, 1932, Serial No. 632,630

24 Claims. (Cl. 260—154)

1. In a process of preparing o-dihydroxy compounds of the benzene series by the hydrolysis of a compound selected from the group consisting of o-dichloro-benzenes, o-dibromo-benzenes, and o-di-iodo-benzenes in the presence of water, hydroxyl ions and metal ions selected from the group consisting of barium and strontium, the step which comprises maintaining the alkali concentration of the reaction mixture below about 3.6 normal.

2,001,015

PRODUCTION OF IRON-CHROMIUM ALLOYS

Alexander L. Feild, Baltimore, Md., assignor, by mesne assignments, to Rustless Iron Corporation of America, Baltimore, Md., a corporation of Maryland

No Drawing. Application June 20, 1934, Serial No. 731,532

11 Claims. (Cl. 75—22.5)

1. In the production of a double heat of ferrous alloys in an electric arc furnace, the art which comprises, melting down a charge of ingredients including iron scrap, a material rich in chromium, and an oxide of iron thereby forming a low-carbon bath of ferrous metal containing chromium and an overlying blanket of slag containing oxides of iron and chromium, withdrawing the bath of metal from the furnace leaving the slag therein, and reducing the oxides of iron and chromium contained in said slag thereby forming a ferrous product rich in chromium.

2,001,016

PRODUCTION OF IRON-CHROMIUM ALLOYS

Alexander L. Feild, Baltimore, Md., assignor, by mesne assignments, to Rustless Iron Corporation of America, Baltimore, Md., a corporation of Maryland

No Drawing. Application July 10, 1934, Serial No. 734,513

11 Claims. (Cl. 75—22.5)

1. In the production of a double heat of iron-chromium alloys in an electric arc furnace, the art which comprises, melting down a charge of ingredients including iron scrap containing chromium and one or more non-oxidizable elements, and an oxide of iron thereby forming a low-carbon bath of ferrous metal containing chromium and one or more non-oxidizable elements covered by a blanket of slag rich in the oxides of iron and chromium, withdrawing the bath of metal containing chromium and one or more non-oxidizable elements from the furnace leaving the slag therein, and reducing the oxides of iron and chromium contained in said slag thereby forming a ferrous product of substantial chromium content and substantially free of non-oxidizable elements.

2,001,017

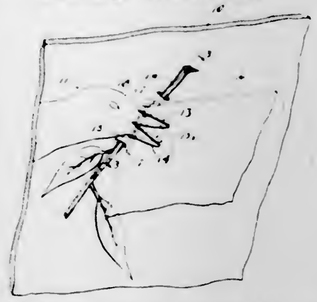
METAL ARTICLE

Otto Feussner and Alfred Jedele, Hanau-on-the-Main, Germany

No Drawing. Application February 20, 1934, Serial No. 712,250. In Germany September 13, 1930

12 Claims. (Cl. 148—32)

1. A permanently fashioned article made of a material consisting at least in major part of at least two metals of the group consisting of platinum, palladium, and gold, said article having a hardened surface formed by an alloy of said material with an element selected from the group consisting of boron, silicon and zirconium.



2,001,018

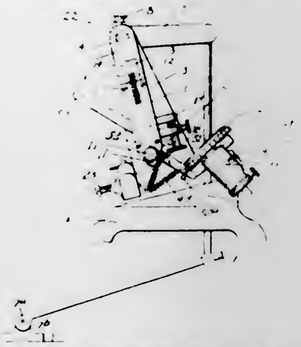
MEANS FOR CONVEYING MESSAGES

Ann M. Fisher, Los Angeles, Calif.

Application May 5, 1934, Serial No. 724,139

2 Claims. (Cl. 40—158)

1. A sheet-like support bearing the representation of an animal, a tongue stuck-out from the support forming the representation of the mouth of the animal, a plate-like member simulating a mailed message having its edge inserted under said tongue, slits formed in the support adjacent the tongue, a twig passed through the slits in such manner that the mouth of the animal appears to hold the twig as well as the message.



2,001,019

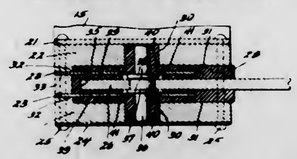
SHOE MARKING MACHINE

Benjamin W. Freeman, Cincinnati, Ohio, assignor to The Louis G. Freeman Company, Cincinnati, Ohio, a corporation of Ohio

Application October 4, 1930, Serial No. 486,437

19 Claims. (Cl. 33—4)

1. A back seam height marking machine having a curved support for supporting a shoe upper with the back seam thereof exposed thereon, marking means movable in a curved line over said support said line conforming in curvature to the curve of the support, said marking means mounted on a member movable in an arc opposed to the curve of the support, and having a resiliently mounted marking edge carried on said member permitting said edge to move in a curve corresponding to the arc of the support and gauging means associated with said support for gauging the desired height of the back seam.



2,001,020

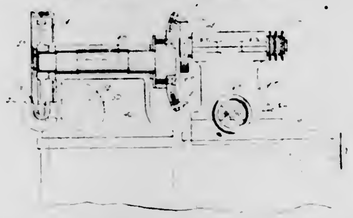
MOTOR MOUNTING

Walter R. Griswold, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application November 20, 1931, Serial No. 576,406

12 Claims. (Cl. 248—14.2)

1. In a mounting for securing a vibration generator to a base, in combination, cooperating friction elements rigidly secured to each of said parts, elastic material separating said parts and adapted to be deformed by relative movement thereof, said elastic material surrounding said friction elements.



2,001,021

METHOD OF AND MACHINE FOR RELIEVING GEAR CUTTERS

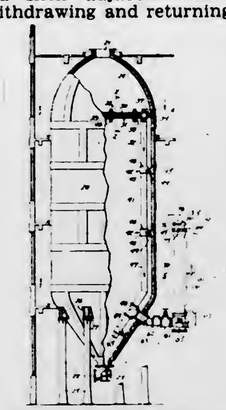
August C. Heard, Rochester, N. Y., assignor to Gleason Works, Rochester, N. Y., a corporation of New York

Application February 23, 1934, Serial No. 712,600

4 Claims. (Cl. 51—105)

1. The method of grinding clearance on the sides of face-mill cutter blades of a given pressure angle which comprises mounting the blades in a rotary head so that they are inclined to a radius of the head at a different angle from the position they occupy when cutting and so that the finished side surfaces to be ground are parallel to the axis of the head instead of being inclined thereto at the given pressure angle, engaging a cylindrical grinding wheel with said blades with the axis of the wheel parallel to the axis of the head, and rotating the wheel and head on their respective axes.

2,001,022



INDIRECT HEATING AND CIRCULATING SYSTEM FOR SULPHITE DIGESTERS

Harlan W. How, Aspinwall, Pa.

Application September 8, 1933, Serial No. 688,672

27 Claims. (Cl. 92—7)

1. In a digester system, a digester shell, means for supporting said shell, means extending through said shell adjacent said supporting means for withdrawing and returning the liquor

in said shell and means for heating the withdrawn liquor.

2,001,023

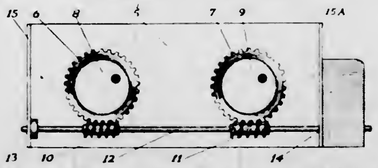
CREPED PAPER

Charles M. Howell, Springfield, and James d'A. Clark, Swarthmore, Pa., assignors to Scott Paper Company, Chester, Pa., a corporation of Pennsylvania

Application October 23, 1934, Serial No. 749,648

6 Claims. (Cl. 154—55)

1. As a product of manufacture, a soft creped multiply towel or toilet tissue paper whereof any ply is made of paper other than cellulose wadding, said product having a potential stretch of not less than fifteen percent.



2,001,024

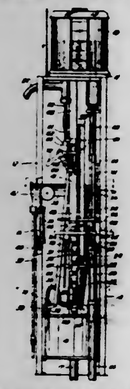
STEREOSCOPIC PICTURE

Milton M. Idzal, Des Moines, Iowa

Application March 10, 1934, Serial No. 714,924

2 Claims. (Cl. 88—20)

1. A stereoscopic picture device embodying a front member presenting a stereoscopic picture, a circular aperture placed in the right view of said stereoscopic picture in a relative position corresponding with a similar aperture placed in the left view of said picture, a pair of discs fitting behind said apertures and bearing on their front surfaces designs completing and forming a part of said right and left views, a pair of gears upon which said discs are mounted, a shaft bearing a pair of worm gears engaging said gears, a rear member or back plate which is bent forward at either extremity in such a manner as to engage the front member and hold same in posi-



tion, and said back plate designed to provide bearings for said gears and worm gear shaft, and to hold the entire mechanism in proper assembly, and an electric motor engaging the end of the worm gear shaft.

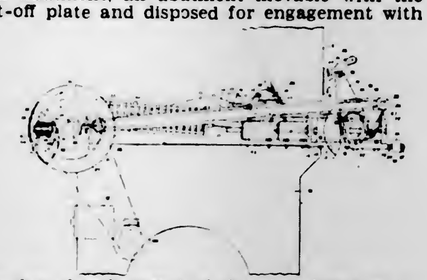
2,001,025

MEASURING AND DELIVERING APPARATUS

Aubrey Carlyle Jamieson, Kew, Victoria, Australia

Application November 21, 1933, Serial No. 699,063
In Australia November 25, 1932
23 Claims. (Cl. 221—100)

1. Measuring and delivering apparatus for petrol and other liquids comprising an elevated measuring bowl, a reciprocating plunger pump for delivering petrol from a reservoir to said bowl, and air or water cylinder having a reciprocating piston for actuating a pivoted lifting arm, a connection between the lifting arm and the plunger of the pump, a valve manually movable to its operative position to supply air or water under pressure to the cylinder, a control member adapted to be progressively moved during the delivery of petrol to the bowl, manually operable selector means for predetermining the volume of petrol to be delivered to the bowl, said control member being adapted to co-operate with said selector means to cause the valve to be moved to its inoperative position when the volume of petrol predetermined by the selector means is delivered to the bowl.



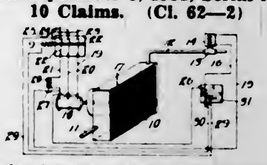
2,001,026

DOUGH DIVIDER

William G. Kirchhoff, Cincinnati, Ohio, assignor to The J. H. Day Company, Cincinnati, Ohio, a corporation of Ohio

Application April 14, 1933, Serial No. 666,164
13 Claims. (Cl. 107—15)

1. In a divider for plastic material the combination of a main shaft supported for constant unidirectional rotation, and means for applying power to said shaft, a pair of eccentrics movable always with the main shaft and offset relative to one another at a spacing of approximately a fifth of a circle arc, a hopper, a hollow housing providing a plunger chamber accessible through the hopper, a reciprocatory plunger working in the plunger chamber to advance plastic substance fed thereinto through the hopper, means for receiving the substance advanced by the plunger, a reciprocable cut-off plate located intermediate the plunger and the hopper, a connecting means associating the plunger with that eccentric which follows the other one during rotation of the main shaft in its given direction of rotation, and a second connecting means associating the cut-off plate with that eccentric which leads the other eccentric, said second connecting means comprising a connecting rod having an end abutment fixed and immovable relative to the connecting rod, and a pusher dog pivoted upon the connecting rod and movable relative to said fixed end abutment, an abutment movable with the cut-off plate and disposed for engagement with



the dog, the abutment of the plate being so located relative thereto as to move through only part of the distance travelled by the connecting rod, a dog knock out element for terminating advancement of the plate by the dog prior to disposition of the dog to its forward limit of travel, and a member movable with the cut-off plate and disposed in the path of movement of the end abutment of the connecting rod, for retraction of the cut-off plate by said end abutment.

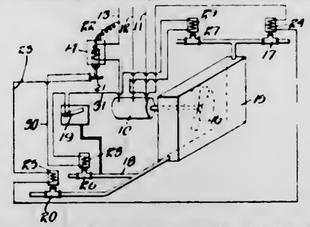
2,001,027

DEFROSTING SYSTEM

William R. Kitzmiller, Waynesboro, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania

Application September 8, 1931, Serial No. 561,800
10 Claims. (Cl. 62—2)

1. A cooler having means for circulating a refrigerant therethrough with a valve for controlling circulation of the refrigerant and a fan for moving a fluid to be cooled over refrigerating surfaces of the cooler, a motor for operating said fan, the load on said motor varying directly in response to a pressure head built up through the cooler due to an impeding of the passage of the fluid to be cooled by an accumulation of frost on the said cooling unit, said variation of the load on the motor being in control of the said valve whereby the said valve will be closed when frost has covered the cooler to a predetermined degree, the fan continuing to operate after closing of the valve to thaw out the frost on the cooler, substantially as set forth.



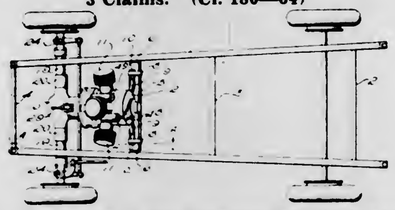
2,001,028

DEFROSTING SYSTEM

William R. Kitzmiller, Waynesboro, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania

Application September 26, 1932, Serial No. 634,947
9 Claims. (Cl. 62—4)

1. A device for defrosting a cooler comprising means for circulating refrigerant through the cooler, a fan adapted to circulate air over the cooler, a motor for operating said fan, the load on said motor varying as a result of the increase in the pressure head in the cooler when the cooler becomes heavily coated with frost, and



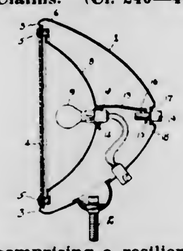
means controlled by variation in the load on said motor for stopping circulation of refrigerant through the cooler and for causing the circulation of a warm fluid therethrough to hasten defrosting of the evaporator, substantially as set forth.

2,001,029

ENGINE SUPPORT FOR AUTOMOBILES

Frank Kulick, Detroit, and Edward L. Kulick, Dearborn, Mich.

Application December 9, 1931, Serial No. 579,946
Renewed March 21, 1935
3 Claims. (Cl. 180—64)



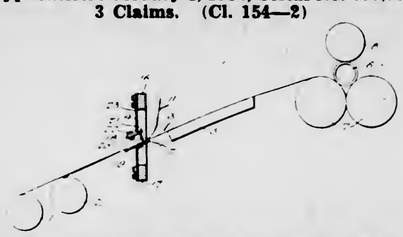
1. In a device of the character described, a pair of axle housings, an axle rotatably mounted in each housing, a yoke connecting the two axle housings and arranged to maintain the axle housings in fixed relation, a differential housing pivotally mounted on the axle housings between the ends of the yoke, an engine secured to the differential housing, a chassis, springs secured to the axle housings and yieldably supporting the chassis thereon, a transverse frame member pivotally mounted in the chassis and yieldable means on the transverse frame member supporting the end of the engine opposite the differential housing.

2,001,030

LAMP

Cyrus B. Kurtz, Cleveland, Ohio

Application May 14, 1934, Serial No. 725,535
5 Claims. (Cl. 240—41.5)



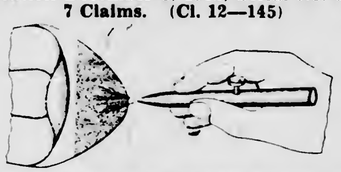
3. A lamp comprising a resilient metal casing having a circular open end, a closure within the casing and of a greater diameter than the open end, a shoulder on the closure spaced from the edge thereof and fitting the circular open end, the difference between the normal inner diameter of said casing at a point adjacent said open end, and the outer diameter of said closure, being greater than the difference between the normal inner diameter of said open end and the diameter of said closure, a reflector, and means within the casing engaging said reflector to retain the closure with its shoulder fitting the circular open end and operable to permit movement of the closure inwardly from the open end to withdraw the closure shoulder from the open end, whereby the casing may be distorted to change the open end to elliptic shape capable of permitting removal of the closure through the greater diameter of the elliptic opening thus produced.

2,001,031

CYLINDRICAL ARTICLES AND METHOD AND APPARATUS FOR MANUFACTURING THE SAME

Gustave E. Landt, Norristown, Pa., assignor to Continental-Diamond Fibre Company, Newark, Del., a corporation of Delaware

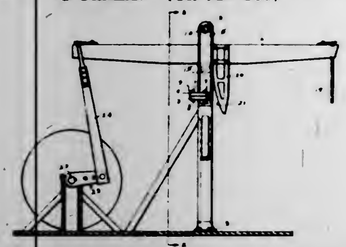
Application February 4, 1932, Serial No. 590,964
3 Claims. (Cl. 154—2)



1. A method of making a cylindrical article from fibrous sheet material and a resinous binder, which comprises feeding adjacently disposed sheets with overlapping longitudinal edges, cutting the sheets at their overlapped portions as they are being fed in a manner to form complementary interdentate edges on the sheets, and so that the junctures of the sheets in the successively wound layers are non-coincident but are superposed one above another, whereby a localized joint structure having numerous non-coincident interlocking intermeshing points throughout the same is provided.

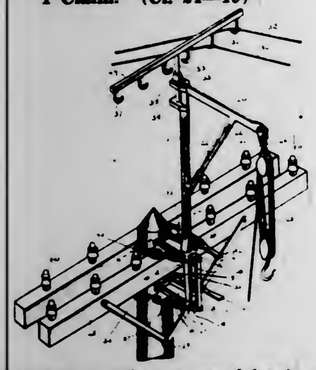
2,001,032

MANUFACTURE OF SHOES HAVING STIFFENED PARTS



Stanley P. Lovell, Newton, Mass., assignor to Arden Box Toe Company, Watertown, Mass., a corporation of Massachusetts

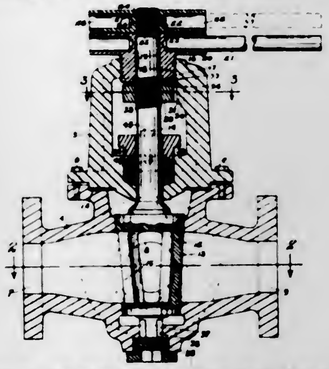
Application December 5, 1932, Serial No. 645,649
7 Claims. (Cl. 12—145)



1. In a method of shoemaking which involves lasting a shoe upper assembly having an internal layer of fabric, those steps which comprise wetting said fabric with a solvent for stiffening agent at the desired zone, associating solid stiffening agent with said wet zone in a form conducive to a prompt and substantially complete solution of said stiffening agent, and conforming said zone to the shape of the last.

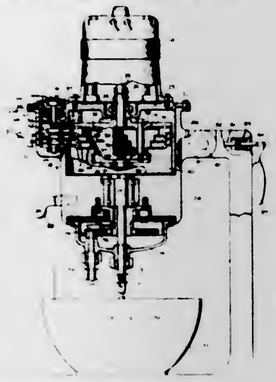
2,001,033
PUMP OPERATING MECHANISM
Albert M. Matherne, Goose Creek, Tex.
Application June 10, 1933, Serial No. 675,264
3 Claims. (Cl. 74—103)

1. In apparatus for operating a pump in a well, an upstanding support, a swinging connecting member on the support, a walking beam mounted to rock on said connecting member, and a depending bearing member on said beam operable against the side of the support and effective to impart a longitudinal movement to the beam upon a rocking movement of the beam in one direction.



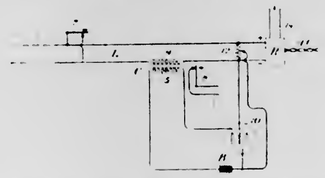
2,001,034
CRANE AND WIRE RACK
Lyman Edwin Mosher, East Herkimer, N. Y.
Application August 19, 1932, Serial No. 629,505
Renewed November 5, 1934
1 Claim. (Cl. 24—19)

In a clamping member, a panel having a reentrant angle, means formed in said panel for supporting a crane, a chain attached to said panel, a bolt, a hook formed on the end of said bolt for engaging said chain, a burr attached to said chain for engaging an object, a nut mounted on said bolt, whereby to hold the same in a predetermined position, a wrench pivotally mounted to said nut, whereby to turn said nut to an adjusted position and reinforcing edge ribs, whereby to strengthen said panel.



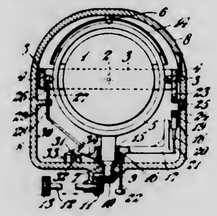
2,001,035
VALVE
Elmer E. Noll, Cincinnati, Ohio, assignor to The William Powell Company, Cincinnati, Ohio, a corporation of Ohio
Application February 9, 1932, Serial No. 591,847
2 Claims. (Cl. 251—97)

2. A valve having in combination a housing provided with ports and a tapered seat, a tapered apertured valve key for engagement with the tapered seat of the housing, a stem rotatable with and fixed relative to the valve key and extending through a portion of the housing, an abutment element normally fixed on the upper end of the stem, a rotatable sleeve threaded onto the housing so as to be axially moved longitudinally of the stem when rotated, said sleeve being rotatable into abutting relationship with the upper fixed ele-



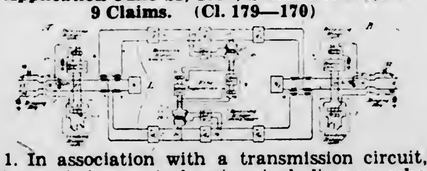
ment on the stem for moving said fixed element and stem together with the valve key, to unseat the valve key, means for rotating the stem whereby to place the ports and apertures in communication, and a combination stop and adjusting member movably secured to the stem in substantial contact with the sleeve and in position to strike the housing when rotated a predetermined amount.

2,001,036
MIXING DEVICE AND THE LIKE
David C. Prince, Swarthmore, Pa., assignor to General Electric Company, a corporation of New York
Application May 13, 1932, Serial No. 611,170
4 Claims. (Cl. 74—277)



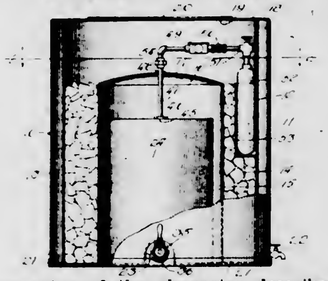
1. In a mixing device and the like having a driving shaft and a driven shaft for operating food preparation tools and the like, a speed-change gear mechanism connecting said driving shaft with said tool shaft comprising a third shaft, means supporting said third shaft and mechanically connecting it with said driving shaft to give it a planetary motion with respect to said driving shaft, a plurality of gears mounted to rotate on said third shaft, driving connections between said gears, a gear on said tool shaft meshing with one of the gears on said third shaft, a plurality of gears meshing with the remaining gears on said third shaft, means selectively engaging said last named gears so as to prevent rotation thereof whereby said tool shaft can be driven at different preselected speeds from said driving shaft, and means controlling said means engaging said gears so as to release the gear that is engaged responsively to a predetermined maximum load on said driven shaft.

2,001,037
VOLTAGE COMPENSATION IN SIGNALING CIRCUITS
Wilton Treat Rea, Flushing, N. Y., and Thomas Clinton Henneberger, Caldwell, N. J., assignors to American Telephone and Telegraph Company, a corporation of New York
Application August 20, 1932, Serial No. 629,698
7 Claims. (Cl. 178—44)



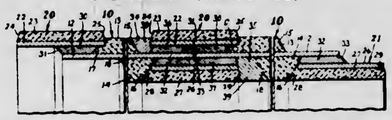
1. In a signaling circuit, a relay, one winding of which is supplied with current from a source of desirably constant but irregular voltage, a second winding on said relay and a supplementary source of voltage continuously supplying current thereto, a vacuum tube in series with the second winding and second source of voltage, and connections from the first source to the vacuum tube whereby the current to the second winding is caused to render the relay substantially independent of said irregularities.

2,001,038
GYROSCOPIC INDICATOR FOR USE WITH AIR AND OTHER CRAFT
George Hancock Reid, London, England
Application January 23, 1934, Serial No. 707,970
In Great Britain January 23, 1933
16 Claims. (Cl. 33—204)



1. An instrument having a gyro mounted for three degrees of freedom and means capable of selective operation for resiliently restraining movements thereof about one axis of freedom and for preventing movements about a second axis of freedom, whereby the device may selectively function as a directional gyro or as an indicator of the rate of angular velocity.

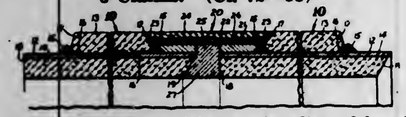
2,001,039
TELEPHONE SIGNALING SYSTEM
Elliot M. Staples, Hohokus, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York
Application June 21, 1932, Serial No. 618,519
9 Claims. (Cl. 179—170)



1. In association with a transmission circuit, a transmission control system including an echo suppressor, means independent of the principal transmission over the circuit for applying thereto alternating current of certain frequencies, signal receiving circuit responsive to said certain frequencies and connected to said transmission circuit and to said echo suppressor, and switching means controlled thereby for disabling said echo suppressor by the operation of said signal receiving circuits.

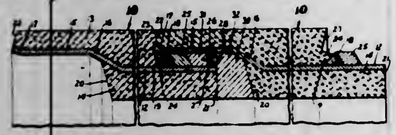
2,001,040
BEER DISPENSING EQUIPMENT
David Sweeney, Maywood, Ill.
Application January 10, 1934, Serial No. 706,114
4 Claims. (Cl. 225—40)

1. Apparatus of the character described, including; a container for liquid; a receptacle having a well adapted to receive said container, an outer wall, and a space between said well and said outer wall adapted to receive a cooling medium; a source of fluid pressure within said receptacle adapted to maintain a constant low pressure in said container; a spring pressed valve removably fixed in said container; a discharge pipe adapted to engage with said valve; a valve operating mechanism integral with said pipe; and a tunnel in said receptacle whereby said operating mechanism extends to the exterior of said receptacle.



2,001,041
REENFORCED CONCRETE PIPE JOINT
Bozidar J. Ukropina, Los Angeles, Calif.
Application July 10, 1933, Serial No. 679,723
2 Claims. (Cl. 72—53)

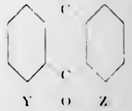
1. A conduit comprising a plurality of lengths of pipe positioned end to end, each of said pipe lengths including a metal reenforcing tube em-



bedded between an outer layer of concrete and an inner layer of concrete, said inner layer of concrete at each end being set back to form an inner chamber, the outer layer of concrete at each end being set back to form an outer chamber, an inner independently formed collar member, the outer diameter of said collar being less than the inner diameter of said pipe reenforcing tube, said collar being positioned in the inner chambers at adjacent ends of said pipe lengths, joint forming material positioned in the space between the outer surface of said collar and the inner surface of said tubes, an outer independently formed collar member, the inner diameter of said outer collar being greater than the outer diameter of said pipe tubes, said outer collar being positioned in the outer chambers at adjacent ends of said pipe lengths, and joint forming material positioned in the space between the outer surface of said tubes and the inner surface of said outer collar.

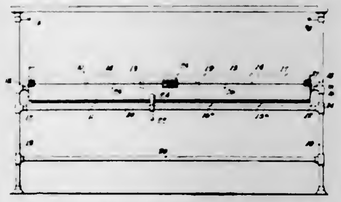
2,001,042
CONCRETE PIPE CONSTRUCTION
Bozidar J. Ukropina, Los Angeles, Calif.
Application July 21, 1933, Serial No. 681,552
6 Claims. (Cl. 72—53)

1. A conduit comprising a plurality of lengths of concrete pipe each having a metal reinforcing cylinder embedded therein which includes end portions, said lengths being laid end to end with a chamber therebetween, an annular metal band on the end portions of said cylinders and spaced from the adjacent ends thereof, said bands being triangular in cross section with the bases thereof engaging said cylinders and secured thereto, collar members each of said collars including a metal band having a ring of concrete thereon, said collar members surrounding the adjacent projecting portions of said pipe cylinders and arranged over said pipe bands, caulking material positioned in the spaces between said pipe cylinders and said collar bands, said caulking material extending from said pipe bands to the adjacent ends of said cylinder and filling material positioned in said chambers between the adjacent ends of said pipe.



2,001,043
CONCRETE PIPE JOINT
Bozidar J. Ukropina, Los Angeles, Calif.
Application July 21, 1933, Serial No. 681,553
3 Claims. (Cl. 72—53)

1. A conduit comprising a plurality of lengths of concrete pipe laid end to end, each of said lengths comprising a metal reinforcing cylinder embedded between an outer and an inner layer of concrete, said cylinder at one end including an integral reduced spigot section, and at the other including an integral bell section, the end of said outer layer of concrete adjacent said bell end terminating in a beveled face in line with the tapered surface of said spigot section, the opposite end of said outer layer of concrete being outwardly beveled, the opposite end of said inner layer of concrete terminating in a beveled face set inward from the adjacent end of said cylinder, a preformed ring of packing material surrounding the spigot portion of said cylinder, the inner end face of said packing engaging said tapered portion of said spigot portion and the outer end face of said packing being spaced inward from the end of the cylinder, the outer diameter of said packing ring being approximately the same as that of the inside of said cylinder, said lengths being laid with one end surrounding the spigot portion of an adjacent end, the adjacent ends of said outer layers of concrete abutting and with a chamber between the adjacent ends of said inner layers of concrete, a caulking material positioned in the space between the cylinder of one length and the spigot section of an adjacent length, said caulking engaging said packing and means to hold said caulking in place.

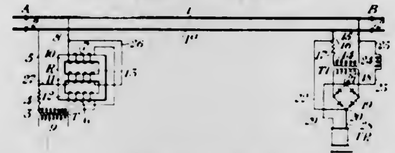


2,001,044
NITROGEN CONTAINING ANTHRAQUINONE DERIVATIVES
Klaus Weinand, Leverkusen-I. G. Werk, Curt Bamberger, Cologne-Mulheim, and Hermann Utsch, Leverkusen-Wiesdorf, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application January 22, 1934, Serial No. 707,848. In Germany February 1, 1933
13 Claims. (Cl. 260—60)

9. The compounds having in their free form the formula:—

wherein Z stands for an amino group, which may contain aliphatic, hydroaromatic or aromatic radicals and one Y stands for an acylamino group, the other Y indicating hydrogen, said compounds being in form of their alkali metal salts blue to bluish-green crystals, dissolving in water with the same coloration, dyeing wool from an acid bath blue to bluish-green shades of excellent fastness properties.

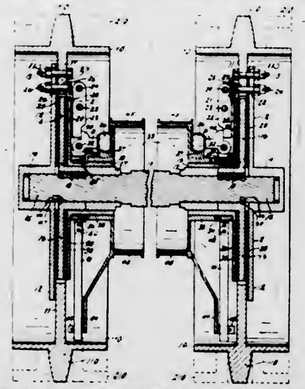
2,001,045
EGG PACKAGING DEVICE
Sidney Weiss, Brooklyn, N. Y.
Application August 30, 1933, Serial No. 687,411
9 Claims. (Cl. 226—14)



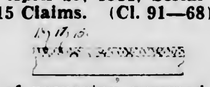
1. An egg packaging device comprising a revoluble tray adapted to receive layers of eggs and empty cartons and having oppositely hinged opposed closures, means to maintain the tray with either closure uppermost, part of said last mentioned means being retractable to permit the tray to be revolved one-half revolution whereby the eggs within the tray may slide into the empty cartons.

2,001,046
MEDICINAL PREPARATION
William E. Welch, Dayton, Ohio, assignor to B. J. Baker & Company, Inc., Boston, Mass., a corporation of Massachusetts, and International Proprietaries Incorporated, Dayton, Ohio, a corporation of Delaware
No Drawing. Application February 13, 1934, Serial No. 711,065
3 Claims. (Cl. 167—54)

3. A medicinal preparation for application to the skin as a penetrant and also useful as an inhalant, said preparation comprising an alcoholic solution of a soap in solidified form having dissolved therein an inhalant and a counter-irritant, said base possessing fixative properties for retarding rapid dissipation of the vapors emitted therefrom.



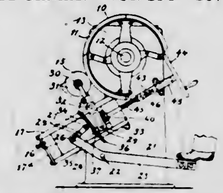
2,001,047
RAILWAY TRACK CIRCUIT APPARATUS
Harold G. Witmer, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application August 26, 1933, Serial No. 686,952
11 Claims. (Cl. 246—34)



4. In combination with a section of railway track, a source of periodic current, means for connecting said source across the traffic rails of the section including a first winding of a reactor having a magnetizable core, a second winding mounted on the core of said reactor, circuit means including a source of direct current supplied over the rails of said section for energizing said second winding to create a steady magnetic flux for determining the reactance of said first winding, means governed by traffic conditions of said section for controlling said circuit means whereby the voltage of the periodic current supplied across the traffic rails is varied in accordance with the presence or absence of a train in said section, and receiving means connected across the traffic rails of the section including an electroresponsive device effectively influenced by the periodic current.

2,001,048
CLUTCH MECHANISM
George J. Ziegler, Los Angeles, Calif., assignor of one-half to Charles J. Heyler, Los Angeles, Calif.
Application June 23, 1933, Serial No. 677,249
6 Claims. (Cl. 192—36)

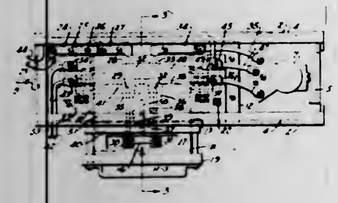
1. A clutch for a vehicle including a tractor wheel as an outer member of the clutch, an axle on which the hub of said wheel is rotatably and slidably mounted, an abutment disk forming the center member of the clutch and having an elongated hub secured to said axle, a thrust disk having a hub rotatably and slidably mounted on said elongated hub and forming the inner member of said clutch, and means including a plurality of radially extending levers pivotally mounted on said inner clutch member for moving it and the outer clutch member into engagment with friction disks carried by the abutment clutch member.



2,001,049
GUMMED PAPER AND METHOD OF PREPARING
Gardner R. Alden, Framingham, Mass., assignor to Dennison Manufacturing Company, Framingham, Mass., a corporation of Massachusetts
Application April 29, 1931, Serial No. 533,652
15 Claims. (Cl. 91—68)

1. Method of preparing gummed paper, comprising applying to a sheet of paper a finely divided open pattern of resist and thereafter applying to the paper a continuous layer of adhesive and subjecting the coated sheet to breaking.

2,001,050
TIRE MACHINE
Henry C. Bostwick, Coventry Township, Summit County, Ohio, assignor to The Akron Standard Mold Company, Akron, Ohio, a corporation of Ohio
Application December 27, 1933, Serial No. 704,120
11 Claims. (Cl. 154—10)



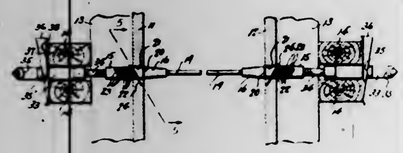
1. Tire-building apparatus comprising a rotary tire-building form, a stitching roller mounted rearwardly and below the axis of rotation of said form, a longitudinal stitcher guide parallel with said axis, a cross-feed slide carrying said guide and mounted for upward, forward movement in an inclined path to bring the stitching roller into operative relation with the form, means carried by said stitcher guide for imparting longitudinal feed movement to the stitching roller, and a forwardly and upwardly extending operating member for the latter means.

2,001,051

TAMPERPROOF METER BOX WITH CUT-OUT CONTROL AND FUSE DRAWER FOR ELECTRIC METERS

Frank A. Bruno, Newark, N. J., assignor to Angelina Mariani, Brooklyn, N. Y.

Application December 1, 1933, Serial No. 700,543
8 Claims. (Cl. 247—2)



1. A device of the class described comprising a box; a cover having means for sealing it to said box to prevent unauthorized opening of the box; wire openings formed in the box; a pair of spaced connectors contained in the box to which one of the load wires of an electric circuit may be connected; said connectors having slotted, flexible contact points; projections formed on both sides of each of said contact points; a cut-out slide mounted in said box; a pair of spaced prongs secured near the outer end of the slide and engageable in the slots in said contact points; a fuse connected across the said spaced prongs and located near the outer end of the slide; cam members associated with the slide for closing the slots in said contact points against said prongs when the slide is moved to its closed position; and means for limiting the movement of the cut-out slide.

2,001,052

RETAINING TIE FOR CONCRETE FORMS

Samuel S. Colt, Orange, N. J.

Application December 6, 1932, Serial No. 645,918
3 Claims. (Cl. 25—131)

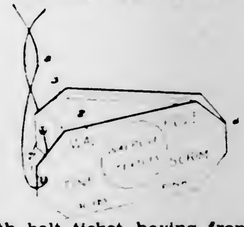
1. In retaining means for concrete forms, a removable coupler means adapted to penetrate a form wall from the exterior thereof to partially extend into the form space to be there detachably connected to a tie rod disposed across the form interior, means directly interconnected between said coupler means and the form wall to affix the former to the latter both in operative predetermined position relative thereto and against turning, said latter means comprising at least one oblique passage provided in a side of said coupler means to incline toward the exterior face of said wall, and a fastening means manipulatable from the exterior of the form wall so as to be driven through said passage and into the wall.

2,001,053

PREPARATION OF PHTHALIC ACID

Lloyd C. Daniels, Crafton, and Alphons O. Jaeger, Mount Lebanon, Pa., assignors, by mesne assignments, to American Cyanamid & Chemical Corporation, a corporation of Delaware

No Drawing. Application January 23, 1931, Serial No. 510,767
3 Claims. (Cl. 260—108)



1. A process of producing phthalic acid from phthalic anhydride which comprises reacting solid phthalic anhydride with steam.

2,001,054

CLOTH BOLT TICKET

Lawrence Davis, Walpole, Mass.

Application March 1, 1933, Serial No. 659,060
4 Claims. (Cl. 40—20)

1. A cloth bolt ticket having front and rear sections, and having a string extending through said sections, and effective to secure the ticket to a bolt of fabric, said ticket including a tab projecting rearwardly therefrom and adapted to be inserted between the cloth board and the fabric wound thereon to secure the ticket against one end of the bolt.

2,001,055

FISH BAIT

William J. De Witt, Auburn, N. Y., assignor to Shoe Form Co., Inc., Auburn, N. Y., a corporation of New York

Application July 27, 1933, Serial No. 682,437
2 Claims. (Cl. 43—47)

1. A fish bait comprising a swivel, a strip of celluloid or other suitable material connected at its leading end to the swivel, and a hook carried thereby said strip being spirally twisted about its longitudinal axis to provide a plurality of twisted surfaces, the leading surface having an aperture therein, the relative movement of the bait and water causing the rotation of the strip at the swivel both by the impact of the water upon the leading surface and also by the impact upon a posterior twisted surface of water flowing through the aperture in the leading surface.

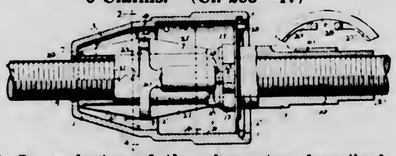
2,001,056

BRACELET CLASP

Charles A. Domler, Providence, R. I., assignor to The Hadley Company, Inc., Providence, R. I., a corporation of Rhode Island

Application November 26, 1934, Serial No. 754,703
7 Claims. (Cl. 24—71)

1. A clasp comprising a holder for receiving a strand, a pair of spaced links pivoted to said holder and arranged to swing inwardly into a closed position upon said holder, and a lever pivotally secured to the outer ends of said links and arranged to swing into a closed position between said links, the free end of said lever having an



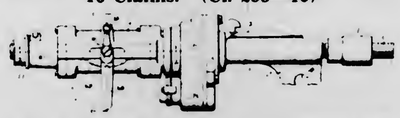
inwardly directed edge constructed and arranged to grip a strand disposed in said holder between the free end of said lever and said holder when said lever and links are swung into closed position.

2,001,057

DRILL BOXING

Louis J. Fellay, Peoria, Ill., assignor to Dooley Bros., Peoria, Ill., a corporation of Illinois

Application December 30, 1933, Serial No. 704,603
6 Claims. (Cl. 255—47)



1. In a device of the character described, in combination, a housing, a pair of coacting threaded liners arranged for assembly in said housing, a drum shaft and means to connect the same with said liners, and a collapsible spring member adapted for connection within said housing for locking the drum shaft, liners and housing in assembled relation.

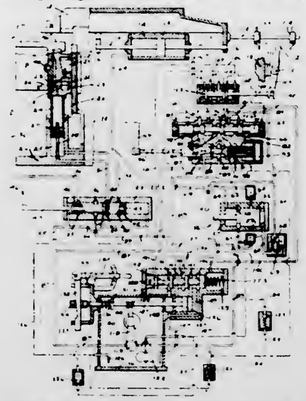
2,001,058

DRILLING MACHINE

Louis J. Fellay, Peoria, Ill., assignor to Dooley Bros., Peoria, Ill., a corporation of Illinois

Application June 28, 1934, Serial No. 732,881
16 Claims. (Cl. 255—46)

1. In a drilling machine, in combination, a housing providing a closure, a cage within the housing, a thread-bar operable through said housing and said cage, coacting separable liner sections disposed within said cage and threaded for engagement with the thread-bar, operating means for the thread-bar, and means for moving the liner sections within said cage to operative and inoperative positions with respect to the thread-bar.



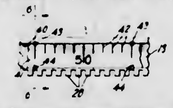
2,001,059

HYDRAULIC DRIVE FOR MACHINE TOOLS

Walter Ferris, Milwaukee, Wis., assignor to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin

Application September 14, 1929, Serial No. 392,507
12 Claims. (Cl. 90—38)

3. The combination, with a machine having a reciprocable carriage, of a hydraulic motor for reciprocating said carriage, a variable displacement pump, means including a reversing valve for directing liquid from said pump to said motor to cause it to drive said carriage in opposite directions alternately, and means actuated by liquid from said pump and connected between said



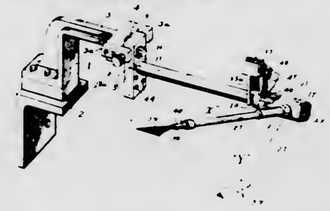
pump and said motor in parallel with said motor for varying pump displacement.

2,001,060

MEANS OF SECURING A SCALE STRIP TO A SCALE BAR

Charles A. Fuchs, Hollis, N. Y., assignor, by mesne assignments, to Ralph C. Coxhead Corporation, New York, N. Y., a corporation of Delaware

Application November 21, 1931, Serial No. 576,498
4 Claims. (Cl. 197—194)

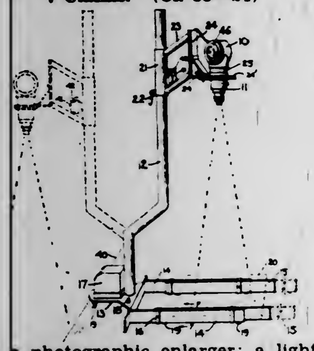


3. A stop bar for a typewriting machine, said bar having a shallow longitudinally extending groove therein, a scale strip in said groove, devices located at wide intervals as compared with the width of the devices lengthwise of the bar and extending into said groove from the side thereof and pressing against said strip to secure it to said bar, and a stop to embrace said bar, said devices being confined entirely within the groove so as not to interfere with the stop.

2,001,061

BEATING-UP LINE POSITION INDICATOR FOR LOOMS

Carroll H. Gibbs, Springfield, Mass.

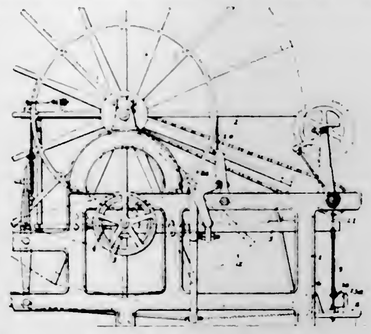


Application May 8, 1934, Serial No. 724,553
6 Claims. (Cl. 139—1)

1. A beating-up line indicator for looms comprising a standard adapted to be secured on a stationary portion of the loom, a bar extending from said standard, over the web of cloth, a sleeve mounted for restricted rotation on the end

of said bar, an indicator arm mounted on and swinging with said sleeve, the end of said arm adapted to contact the top of the cloth and swing in a plane disposed normal to the weft thread thereof, a spring disposed between said bar and said sleeve adapted to automatically return said indicator arm to its original position after being manually depressed and the manual pressure released and means to variously position said bar on said standard for the purpose of bringing the free end of said indicator arm into register with the weft-beating-up line of the cloth.

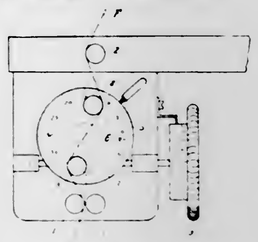
2,001,062
PHOTOGRAPHIC ENLARGER
Alvin Grant, Denver, Colo.
Application June 18, 1934, Serial No. 731,128
7 Claims. (Cl. 88—24)



1. In a photographic enlarger: a light housing; a lamp within said housing; a lens tube projecting from one side of said housing condensing lenses within said tube; a plate hinged below said lenses; projection lenses secured to said plate; and means for detachably securing said hinged plate with said projection lenses in alignment with said condensing lenses; a shouldered recess formed in said hinged plate; a first glass plate fitted in said recess; a second glass plate hinged in said recess above said first glass plate so as to receive a film therebetween; and a laterally extending film groove formed in said hinged plate at opposite sides of said glass plates, the bottom of said film groove being substantially in alignment with the upper face of said first glass plate.

2,001,063
MANUFACTURE OF BZ1, BZ1'-DIBENZANTHRONYL
Edward T. Howell, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 27, 1932, Serial No. 648,978
17 Claims. (Cl. 260—61)

16. A technical Bz1, Bz1'-dibenzanthronyl substantially free of higher oxidation products and which, after recrystallization from nitrobenzene, has a melting point of about 414–425° C.



2,001,064
CONTROL MECHANISM FOR WARPING MACHINES AND THE LIKE
Frederick Klein, Glen Rock, N. J., assignor to Sipp-Eastwood Corporation, Paterson, N. J., a corporation of New Jersey
Application March 22, 1934, Serial No. 716,794
11 Claims. (Cl. 28—51)

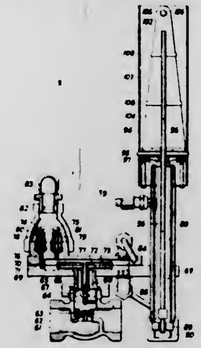
1. Mechanism for controlling the rotation of a rotary element of a machine of the class described comprising actuating means, actuated means including a rotary driver to be moved against said element on movement imparted to the actuated means from the actuating means,

and a coupling movable on one of said means into position for engagement with the other means and thereupon adapted to transmit motion to the actuated means on movement of the actuating means.

2,001,065
MANUFACTURE OF ELECTRIC CABLES
Maurus Klein, Berlin, Friedrichshagen, Germany
Application November 5, 1931, Serial No. 573,195
In Germany March 3, 1931
2 Claims. (Cl. 117—20)

1. In a method of manufacturing electric cables for signalling which comprise twisted strands of insulated conductors, supporting loosely wound supplies of the strands in coils from below, taking said strands not yet being under tension from said coils and drawing them by equal force through direct brakes coordinated individually to each of said strands, said brakes working by deforming the strands, applying thereby equal tension to each of said strands, and combining and twisting the strands while being under equal tension.

2,001,066
HYGROSCOPIC MATERIAL AND METHOD OF PREPARING THE SAME
Albert J. Loepsinger and William M. Trafton, Providence, R. I., assignors to American Moistening Company, Providence, R. I., a corporation of Maine
No Drawing. Application July 17, 1931, Serial No. 551,579
2 Claims. (Cl. 297—1)



1. A hygroscopic element for humidity responsive apparatus, consisting of a piece of animal membrane composed substantially of elastin.

2,001,067
PUZZLE
Louis Ray Lane, Habana, Cuba
Application August 31, 1934, Serial No. 742,301
5 Claims. (Cl. 273—153)

1. A puzzle comprising an outer spherical shell having an opening, an inner ball rotatable in any direction, and means on said shell and said ball adapted to be brought into registration by the movement of the ball for solving the puzzle.

2,001,068
PORTABLE HEATER
John R. MacGregor, Albany, and Eldred E. Edwards, Oakland, Calif., assignors to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
Application April 25, 1932, Serial No. 607,461
2 Claims. (Cl. 236—80)

1. Apparatus for controlling the flow of gas to a portable heater having a main and a pilot burner, comprising a main valve body, a valve in said body, a diaphragm adapted to move said valve, a single valve means for admitting gas pressure to either side of said diaphragm, thermally responsive means for controlling said last named valve, and restricted passages from both sides of said diaphragm to release gas pressure thereon, said passages being unaffected by the position of said last named valve means and adapted to supply gas to the pilot burner.

2,001,069
ART OF TREATING SHOES
Herman Metz and Robert H. Brown, Paterson, N. J.; said Brown assignor, by mesne assignments, to said Metz
Application June 18, 1934, Serial No. 731,137
6 Claims. (Cl. 12—142)

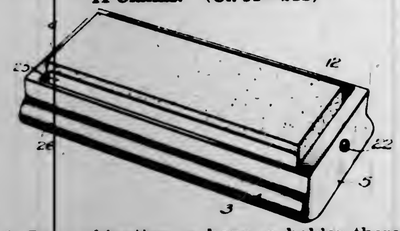
1. The method of treating a shoe having a pluri-ply counter of pliable heat-shrinkable material which consists in applying heat to an exposed surface of one ply in a region of the counter in a zone of limited width and paralleling and substantially immediately subjacent to the top margin of the counter and thereby shrinking said region and thereupon applying

heat to an exposed surface of another ply in a region substantially coinciding with the first region and thereby effecting shrinkage in the second region.

2,001,070
NITROCELLULOSE GEL AND METHOD OF PRODUCING
Fred K. Shankweiler, Newport, and Walter E. Gloor, Wilmington, Del., assignors to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 29, 1932, Serial No. 608,340
18 Claims. (Cl. 44—7)

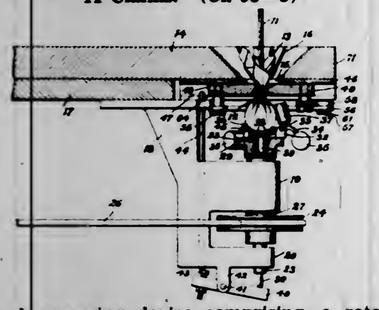
1. A stable nitrocellulose gel including nitrocellulose, a nitrocellulose solvent, finely divided metal powder non-reactive with the nitrocellulose solvent and a metallic salt non-reactive with and soluble in the nitrocellulose solvent, either the metallic powder or the metallic salt including copper.

2,001,071
RUBBER COMPOSITION AND METHOD OF PRESERVING RUBBER
Robert L. Sibley, Nitro, W. Va., assignor to The Rubber Service Laboratories Company, Akron, Ohio, a corporation of Ohio
No Drawing. Application September 30, 1932, Serial No. 635,633
36 Claims. (Cl. 18—50)



9. The method of preserving rubber which comprises treating rubber with the reaction product of substantially one molecular proportion of acetone-anil and substantially one atomic weight portion of sulfur.

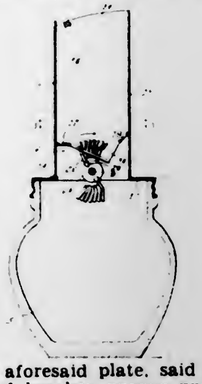
2,001,072
BUCKLE
Frank E. Stahl, Tonawanda, N. Y., assignor to Columbus McKinnon Chain Corporation, Tonawanda, N. Y., a corporation of New York
Application September 2, 1932, Serial No. 631,519
7 Claims. (Cl. 24—193)



1. As an article of manufacture, a buckle for clamping a strap in locked position, comprising a lock plate, lock ears formed on the plate and extending outwardly from the plate at points set in some distance from the edge of the plate, an eccentric lever rotatably carried by the lock ears, and a clamping bar carried by the lock ears and in interspaced relation with the eccentric lever.

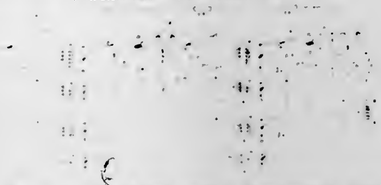
2,001,073
HONE
Jake Manfred Stivers, Carthage, Mo.
Application May 3, 1934, Serial No. 723,672
11 Claims. (Cl. 51—211)

1. In combination, a hone, a holder therefor, comprising a receptacle having a ridged inner bottom, and means for holding said hone on said ridge either rockably or stationary as desired.



2,001,074
WRAPPING MACHINE
Oscar M. Stout, Garden City, and Hans Hoyer, Woodhaven, N. Y., assignors to Sweets Company of America, Inc., New York, N. Y., a corporation of Virginia
Application July 31, 1934, Serial No. 737,700
11 Claims. (Cl. 93—5)

1. A wrapping device comprising, a rotating support, a plurality of weighted arms pivotally mounted on said support and rotated therewith, fingers carried by said arms and adapted to be brought against an article and a wrapper, by centrifugal force acting on the weighted arms during rotation of the support to hold the wrapper against the article.

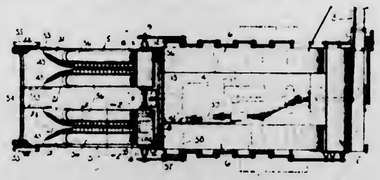


2,001,075
NUT CHOPPER
Carl A. Sundstrand, Rockford, Ill.
Application November 21, 1932, Serial No. 643,670
13 Claims. (Cl. 146—123)

1. In a device of the class described arranged to be mounted on a suitable receptacle, a hopper formed from a single piece of sheet metal to provide spaced side walls and a back wall extending therebetween, a slide formed from another piece of sheet metal arranged to serve as the front wall of said hopper, the front edges of the side walls being bent to form flanges, and said slide having the lateral edges thereof formed to fit slidably on said flanges, a sheet metal plate disposed in the lower end of the hopper and suitably secured to the side walls thereof, whereby to hold the latter in a predetermined relation besides forming the bottom of the hopper, said plate being bent to V cross-section, the crotch portion of the V having a plurality of transverse slots provided therein in parallelism, whereby to provide a series of parallel breaker bars, and a blade rotatably mounted on the side walls of the hopper

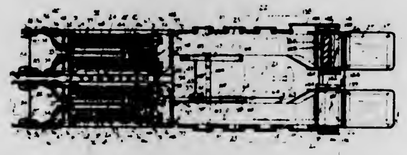
beneath the aforesaid plate, said blade having a plurality of breaker prongs projecting from the edge thereof and entered in the slots between the bars for cooperation with the latter in the breaking up of material placed in the hopper.

2,001,076
RADIO TUNING APPARATUS
Sarkes Tarzian, Bryn Mawr, Pa., assignor to Atwater Kent Manufacturing Company, Philadelphia, Pa.
Application February 28, 1934, Serial No. 713,267
7 Claims. (Cl. 250—40)



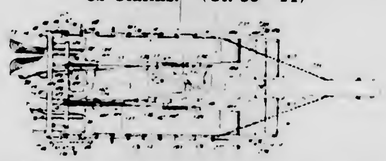
5. In a multi-range radio frequency tuning system, the combination of inductances of substantially different values supported on a common form, means for providing mutual coupling between said inductances, separate adjustable capacities permanently connected in parallel to said inductances, the circuits comprising said inductances and capacities being used in non-adjacent ranges, another circuit of inductance and capacity for use in frequency ranges adjacent to the frequency ranges employing the first mentioned circuits, means insuring substantially zero coupling between circuits of adjacent ranges, and means for successively connecting a variable capacity to each of said circuits for tuning through a range of frequencies.

2,001,077
HARVESTER
Frederick A. Thomann, East Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application February 24, 1930, Serial No. 430,731
Renewed August 6, 1934
28 Claims. (Cl. 56—33)



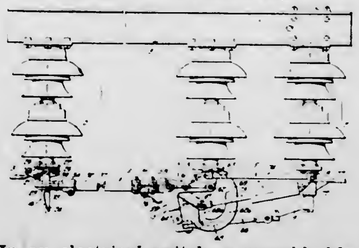
1. In combination, a pair of rotatable means each having cotton engaging means thereon

adapted to strip cotton from plants, the engaging means of one rotatable means overlapping the engaging means of the other rotatable means, and stationary means for stripping cotton from said engaging means, said engaging means having portions thereof inclined in a direction op-



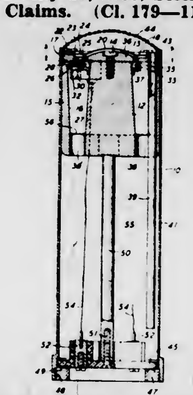
posite to that of rotation of said rotatable means and said stationary means having a portion thereof inclined toward said rotatable means, whereby the coaction between said engaging means and said stationary means permits of free removal of cotton by said stationary means.

2,001,078
HARVESTER
Frank T. Court, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application March 29, 1930, Serial No. 439,888
Renewed August 6, 1934
55 Claims. (Cl. 56—11)



1. The combination, in a cotton harvester adapted to be mounted on a tractor, of row-following means having mechanism to operate upon plants and remove cotton therefrom, and means mounted forwardly of the row-following means for supporting the forward portion thereof from the ground surface, causing the same to follow the undulations of the ground surface.

2,001,079
COTTON HARVESTER
Frank T. Court, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application March 4, 1931, Serial No. 519,926
Renewed August 6, 1934
32 Claims. (Cl. 56—14)



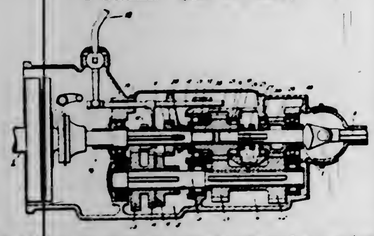
1. A cotton harvesting machine comprising row-following, plant stripping means extending in a generally longitudinal direction, and conveying means for receiving cotton from said stripping means, said conveying means including rotary elements also serving to remove foreign matter from the cotton, said last named means extending generally rearwardly alongside the longitudinally disposed stripping means and effective for continuous operation from stripping to discharge of the cotton.

2,001,080
ELECTRICAL SWITCH
Joseph S. Thompson, San Francisco, Calif., assignor to Pacific Electric Manufacturing Corporation, San Francisco, Calif., a corporation of California
Application March 13, 1934, Serial No. 715,263
4 Claims. (Cl. 200—48)

1. In an electrical switch, a movable blade, a relatively stationary contact adapted to co-operate with one end of the blade, a crank having spaced pivotal connections with the other end of the blade and with a fixed support respectively, a stationary cam, a lever arm fixed to the blade and effectively engaging said cam, said cam having one portion thereof adapted to afford a substantial amount of continued movement of the crank after the blade has been moved to substantially closed position with respect to the stationary contact, and having another portion thereof formed to afford swinging movement of the blade between open and closed positions, and counterbalancing means connected to said lever arm, whereby said cam serves to simultaneously vary the effective counter-balancing of the blade.

2,001,081
ACOUSTIC DEVICE
Albert L. Thuras, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application May 10, 1933, Serial No. 670,291
3 Claims. (Cl. 179—115.5)

1. An acoustic device comprising a magnet having a central pole piece, an outer pole having a rim portion containing two radial slots located on different diameters, an outer pole piece carried by the outer pole and forming an air-gap with the central pole piece, a diaphragm supported by said outer pole piece, and a coil attached to said diaphragm and adapted to be positioned in said air-gap, said outer pole piece



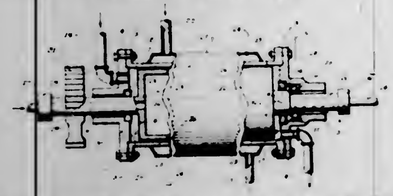
having two members extending radially therefrom for engagement with said slots to center said coil in said air-gap.

2,001,082

CHANGE SPEED GEAR MECHANISM FOR MOTOR VEHICLES

Max Wagner, Stuttgart, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany, a company of Germany

Application June 12, 1931, Serial No. 543,877
In Germany June 13, 1930
1 Claim. (Cl. 74—333)



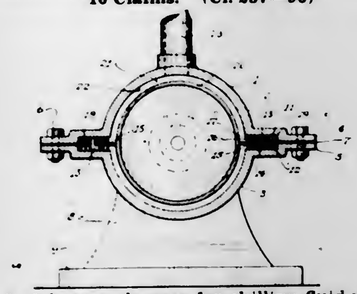
Change speed gear mechanism for motor vehicles comprising, in combination, a set of shiftable gears mounted on the driving shaft directly at the rear of the engine of the vehicle, adapted to be engaged with and disengaged from a set of conventional forward speed and reverse gears mounted on a counter-shaft below said drive shaft, a rearward extension on said counter-shaft beyond the rear end of said driving shaft, a driven shaft mounted rearward of and in alinement with said driving shaft, an intermediate gear receiving within its hub the adjacent ends of both said driving and driven shafts, a gear in constant mesh with said intermediate gear rigidly mounted therebelow on said rearward extension of the counter-shaft, another gear rigidly mounted on said counter-shaft-extension rearwardly of said before mentioned gear in constant mesh with a gear loosely mounted on said driven shaft, rearwardly of said intermediate gear, means for selectively engaging said intermediate gear with said driving shaft to rotate therewith, and means for alternatively engaging said intermediate gear, the gear mounted rearwardly thereof on the driven shaft, to rotate with the latter, and automatic means for forcibly engaging one of the two last mentioned gears with said driven shaft to rotate therewith at all times when the other of said gears is not engaged therewith.

2,001,083

CHILLING DEVICE

Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware

Application August 10, 1933, Serial No. 684,532
7 Claims. (Cl. 257—88)



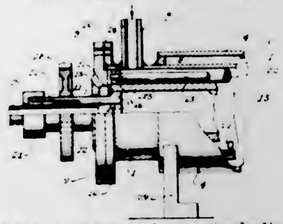
2. A chilling device comprising a cylindrical shell constituting an outer cooling element and provided at its ends with heads having central tubular extensions, the central tubular extension of one of the heads being enlarged to form an interior annular recess, a thrust bearing mounted in the said recess, a hollow rotary cylinder constituting an inner cooling element and having hollow shafts mounted in the tubular extensions of the said heads, one of the hollow shafts being provided with an enlargement forming a shoulder abutting the thrust bearing, means for introducing a liquid into the shell adjacent the other head, said inner and outer cooling elements forming a capillary space between them for the passage of the liquid and the capillary space being adapted to cause a drop in the pressure of the liquid and produce an end thrust against the said bearing, means for circulating a refrigerant interiorly of the rotary cylinder, and means for circulating a refrigerant exteriorly of the said shell.

2,001,084

HEAT EXCHANGE DEVICE

Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware

Application July 9, 1934, Serial No. 734,263
16 Claims. (Cl. 257—96)



1. A heat exchanger for chilling fluid products including an outer casing having an inlet and an outlet for the passage of the product into and out of the casing, a hollow rotor mounted within the casing and spaced therefrom to form a narrow intervening space for enveloping the rotor within a thin sheet of the product to be chilled, means for introducing a refrigeration medium into the rotor, means for removing it therefrom, and means operating within the narrow intervening space between the rotor and the outer casing for removing frozen material from the surface of the rotor whereby the same is maintained at maximum efficiency.

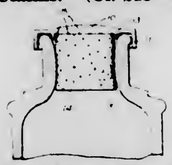
2,001,085

HEAT EXCHANGE DEVICE

Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware

Application July 25, 1934, Serial No. 736,828
21 Claims. (Cl. 257—89)

1. A heat exchange device including a main cylindrical shell having an inlet and outlet for



the introduction and removal of a fluid product to be chilled or heated and a hollow cylindrical rotor arranged within the main shell and spaced therefrom to provide an intervening space for the said fluid product, said rotor being provided with an inlet and an outlet for the passage of a chilling or heating medium, and cleaning means located in the intervening space between the main shell and the rotor and having a rolling contact with the shell and the rotor for cleaning the surfaces thereof without scraping the same, said cleaning means also supporting the rotor for rotative movement.

2,001,086

CLOSURE

Charles M. Villanyi, Bayside, N. Y., assignor to L. Mundet & Son, Inc., New York, N. Y., a corporation of New York

Application March 21, 1931, Serial No. 524,228
2 Claims. (Cl. 215—48)

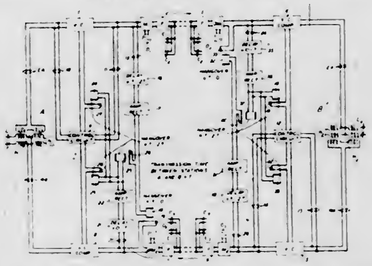
1. A closure including a cap, a plug secured to the inner face of said cap, a bored extension forming a part of said cap and a swab mounting rod extending through said plug and having frictional engagement with said bore, the outer end of said rod being split and extending angularly with respect to the rod body.

2,001,087

IMPACT TESTING MACHINE AND METHOD

John Herbert Abramson, Rockford, Ill., assignor to Greenlee Bros. & Co., Rockford, Ill., a corporation of Illinois

Application February 9, 1931, Serial No. 514,371
16 Claims. (Cl. 265—13)



7. A testing apparatus comprising a plurality of graduated striking hammers, a guiding tube adapted to guide the vertical movement of said hammers, a hammer holder secured to the upper end of said tube having a plurality of openings for slidably holding said hammers, means for rotating said holder to bring successive openings into registration with said tube and permit said hammers to drop therethrough, a striking blade slidably positioned in the lower end of said tube and having a lower end projecting therefrom, and means for supporting a test piece having an edge with said edge against said blade.

2,001,088

TRANSMISSION CONTROL IN TWO-WAY SIGNALING SYSTEMS

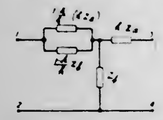
Bjorn G. Bjornson, Brooklyn, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application January 27, 1932, Serial No. 589,197
8 Claims. (Cl. 179—170)

1. In a two-way signal transmission system comprising at least near the terminals thereof normally operative one-way paths for transmitting signals in opposite directions, means connected to the outgoing one-way path near at least one terminal of the system, and responsive to outgoing signals therein to disable the incoming path at the same terminal substantially at the same time as the arrival of said outgoing signals at the other terminal of the system, and means connected to the incoming path near said one terminal, and responsive substantially immediately to incoming signals therein to disable the output of the incoming path-disabling means at the same terminal.

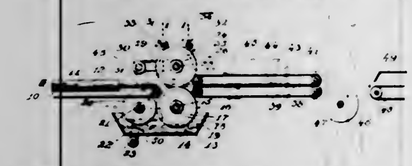
2,001,089

HORN



David G. Blattner, Mountain Lakes, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application April 7, 1933, Serial No. 664,891
14 Claims. (Cl. 181—27)



1. In a horn, a logarithmically tapered throat portion having a single passage and a mouth portion comprising a plurality of diverging sound passages each increasing in cross-sectional area at the same rate as the throat portion.

2,001,090
TRANSMISSION NETWORK
Hendrik W. Bode, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 13, 1933, Serial No. 689,228
8 Claims. (Cl. 178—44)

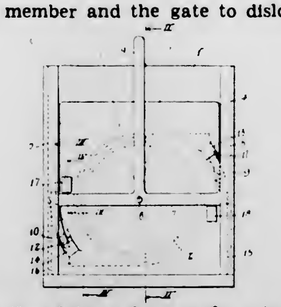
5. A four-terminal transmission network having the same transfer constant as a prototype network comprising a single series impedance Z_a and a single shunt impedance Z_b, comprising a series branch having an impedance hZ_a, a shunt branch of impedance Z_b and a second series branch having an impedance $(1-h)/h$ times the impedance of said first mentioned series branch and said shunt branch in parallel, where h is a positive numeric less than unity.

2,001,091
COATING DEVICE
Frank P. Carlson, Astoria, N. Y.
Application July 21, 1933, Serial No. 681,459
18 Claims. (Cl. 91—50)

1. In a coating device, the combination with a single supply source, of a plurality of coacting coating carriers adapted to simultaneously coat both faces of the work, means in cooperation with one of the carriers for evenly distributing the coating thereover, without permitting an undue accumulation thereon, and the sides thereof, of a surplus of the coating, and means in operative engagement with another carrier for evenly distributing thereover the coating prior to applying it to the work.

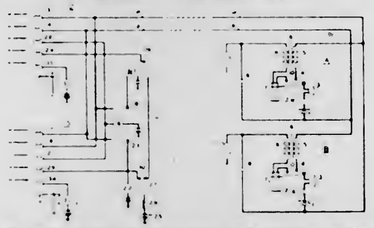
2,001,092
IMPLEMENT FOR DRIVING STAPLES, FASTENERS, AND THE LIKE
John F. Cavanagh, Providence, R. I., assignor to Boston Wire Stitcher Company, Portland, Maine, a corporation of Maine
Application June 8, 1932, Serial No. 616,065
21 Claims. (Cl. 1—49)

1. In an implement for driving staples or the like, a handle, a head at one end thereof, staple-driving means on the head, a lever movable by impact with the work and a second lever actuated by the first lever to positively actuate the staple-driving means.



2,001,093
BUMPER MECHANISM
Peter N. Cherpes and Christ E. Kollias, Chicago, Ill.
Application February 1, 1934, Serial No. 709,286
5 Claims. (Cl. 180—83)

1. In an automotive vehicle, in combination, a pair of longitudinally extending housings adjacent one side of the vehicle, a similar pair of longitudinally extending housings adjacent the other side of the vehicle, two springs in tandem in every housing, two bumpers at the front end of the vehicle in horizontally spaced relation and both capable of inward and outward movement with respect to the vehicle, rods supporting and guiding the outer of said bumpers, one of said rods extending along and between the pair of housings adjacent one side of said vehicle, and another of said rods extending along and between the pair of housings adjacent the other side of said vehicle, said rods projecting beyond the inner ends of said housings, two rods supporting and guiding the inner bumper adjacent one end thereof and entering the adjacent housings, two other rods supporting and guiding the other end of said inner bumper and entering the adjacent housings, said four latter rods having spaced heads thereon within the respective housings, the heads adjacent the outer ends of said housings being fixed to said rods and the heads adjacent the inner ends of said rods being movable along said rods, the forward springs in every housing being disposed about the rod therein and between the heads on said rod, pistons within said housings adjacent the inner ends thereof, the rearward spring in every housing being between the piston and movable head in the housing, piston rods connected to said pistons and projecting through the inner ends of said housings, interconnecting means between the rods of the outer bumper and said piston rods for effecting movement of said piston rods in directions opposite to that of the movement of the outer bumper rods for compressing the rearward springs within said housing to cushion the inward movement of said outer bumper under impact, continued movement of said outer bumper under impact causing inward movement of said inner bumper and compression of the forward springs of said housings to compound the cushioning effect of said springs.

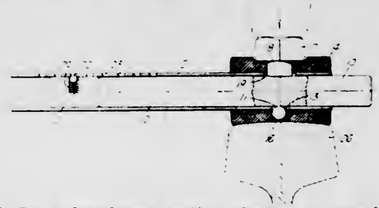


2,001,094
GATE VALVE
Francis Cuttle, Riverside, Calif.
Application August 5, 1933, Serial No. 683,838
3 Claims. (Cl. 251—56)

1. In a gate valve, a plate member having an orifice therein, a gate, grooved guides on said plate member for receiving the edges of said gate, a cross bar pivotally secured to the rear side of said gate and having tips extending laterally and forwardly from the outer ends thereof, said tips extending laterally in opposite directions, apertures in said gate through which said forwardly extended tips may pass, whereby rotation of said bar in one direction forces said tips through said openings and between the juxtaposed surfaces of the plate member and the gate to dislodge the

gate from the plate, and means for rotating said bar about its pivot.

2,001,095
TWO-PARTY LINE TELEPHONE SYSTEM
Gerald Deakin, New York, N. Y., assignor, by mesne assignments, to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application April 27, 1933, Serial No. 668,179
6 Claims. (Cl. 179—8.5)



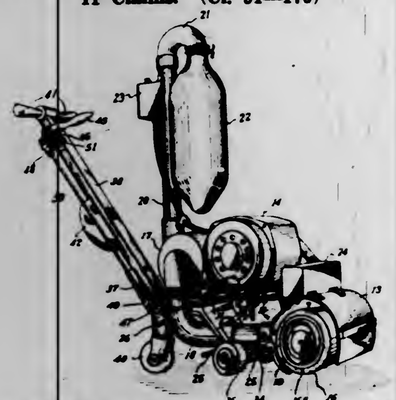
1. A two party automatic telephone exchange system comprising a rectifier at each station, a line circuit, a service meter individual to each station and located at the central office, and means including a finder switch for each station whereby only the service meter individual to one of said stations is adapted to be associated with the line circuit when said station originates a call.

2,001,096
PRESSURE MEASURING SYSTEM
Paul B. Flanders, East Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application February 8, 1933, Serial No. 655,698
6 Claims. (Cl. 177—351)

1. A vibration translating device of the electrostatic type for measuring low frequency variations in high fluid pressures comprising a housing of the order of one inch diameter adapted to be connected directly to the fluid container with the end thereof exposed to the fluid to serve as the vibratile element of the device, and an elongated electrode mounted in and in close spaced relation to the housing with one end in close spaced relation to the element.

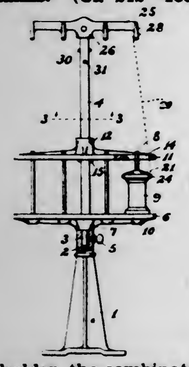
2,001,097
HARDNESS TESTER
Royal E. Frickey, San Francisco, Calif., assignor to Welding Service, Inc., San Francisco, Calif., a corporation of California
Application October 2, 1933, Serial No. 691,750
3 Claims. (Cl. 265—13)

3. In a hardness testing device, a metal bar of known hardness, an impression ball formed of metal substantially harder than the metal of said bar and adapted to be interposed between one side of said bar and the body to be tested whereby an impact upon said bar causes said ball to indent both the bar and said body simultaneously, and a body of resilient vulcanized rubber surrounding the ball at one side of the bar, said last body forming a friction surface for engaging with the body to be tested, the friction surface being spaced from the bar a distance greater than the diameter of the ball.



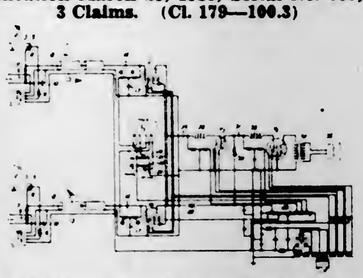
2,001,098
FLOOR SURFACING MACHINE
William E. Holt, Newark, N. J.
Application May 19, 1933, Serial No. 671,915
6 Claims. (Cl. 51—176)

1. A floor surfacing machine comprising a housing, a surfacing drum rotatably mounted within said housing, a dust suction nozzle positioned within said housing adjacent said drum, a fan fixed to said housing and arranged to communicate with said nozzle, an electric motor mounted on the top of said housing and having driving connections to said drum and fan, a rearwardly in-



clined dust pipe connected to the discharge of said fan and having an inverted U-shaped section at its upper end extending forwardly thereof, grip members mounted on said dust pipe below said U-shaped section, and a dust bag communicating with the forward end of said U-shaped section and positioned at the front of said dust pipe, said dust bag being arranged throughout its extent in spaced relation to said electric motor.

2,001,099
FLOOR SURFACING MACHINE
William E. Holt, Newark, N. J.
Application February 12, 1935, Serial No. 6,153
11 Claims. (Cl. 51—176)

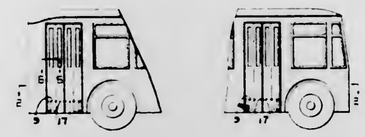


1. A floor surfacing machine comprising a supporting truck having a pair of supporting wheels mounted at its forward end, a housing tiltable about the axis of said truck supporting wheels, a surfacing drum rotatably mounted in said housing adjacent its forward end, a motor mounted on said housing, a driving connection between said motor and drum, and means for tilting said housing relative to said truck to move said drum toward and away from its operative position.

2,001,100
SPOOL HOLDER
Alexander Kaplan, Cleveland, Ohio
Application May 3, 1934, Serial No. 723,653
3 Claims. (Cl. 242—139)

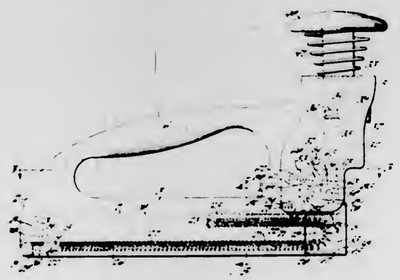
1. In a spool holder, the combination of a base, pins projecting from the base adapted to receive spools, a bar projecting from the base, a plate slidably mounted upon the bar, the plate having openings opposite said pins, means for limiting the movement of said plate upon said bar from a position below the upper ends of said pins to a position for permitting removal of the spools from said pins, a lock carried by said plate, the lock having a lock-pin, and the lock-pin being adapted to lock said plate to said bar in either of said positions.

2,001,101
SWITCHING SYSTEM
George T. Lorance, Chappaqua, N. Y., assignor to Electrical Research Products, Inc., New York, N. Y., a corporation of Delaware
Application March 29, 1933, Serial No. 663,282
3 Claims. (Cl. 179—100.3)



1. In a sound picture reproducing system, two sound reproducing channels, each of said channels including a photoelectric cell and a space discharge amplifying device having a control electrode that is connected to said cell through a circuit of high impedance, an output circuit common to said channels, a filter comprising resistance and capacitance in the biasing circuit connected with each of said control electrodes, and means for applying a disabling potential alternatively to said control electrodes through said respective associated filters, whereby upon the operation of said means the amplitude of signals gradually decreases in one of said channels and gradually increases in the other without a noticeable interruption of signals in said output circuit.

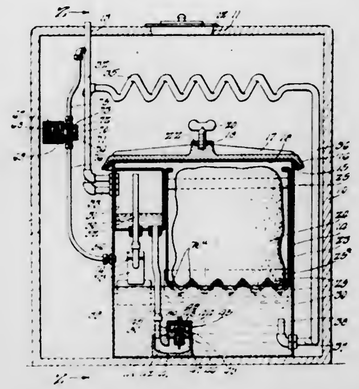
2,001,102
METHOD FOR THE PRODUCTION OF ARALKYL ETHERS OF CELLULOSE
Eugene J. Lorand, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 12, 1934, Serial No. 734,803
6 Claims. (Cl. 260—152)



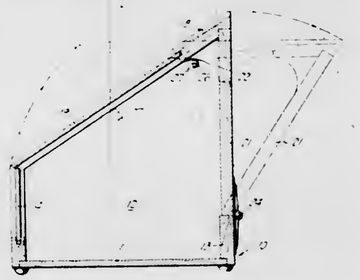
1. The method for the production of an aralkyl ether of cellulose which includes treating alkali cellulose with a mixture of an aralkyl halide and the corresponding diaralkyl ether to effect reaction between the alkali cellulose and the aralkyl halide, whereby the hydrolysis of the aralkyl halide is reduced.

2,001,103
MEANS FOR ACTUATING FOLDING DOORS
Edmund G. Mathauer, Philadelphia, Pa., assignor to American Car and Foundry Motors Company, New York, N. Y., a corporation of Delaware
Application June 20, 1933, Serial No. 676,648
2 Claims. (Cl. 296—49)

1. In a vehicle provided with a doorway and a step well, hinged doors normally closing said doorway, a floor for the vehicle, parallel housings at opposite sides of said step well, floor extensions covering said housings, and door operating means enclosed in said housings and being operably connected to the hinged doors at points spaced from the passageway whereby an unobstructed entrance is provided.



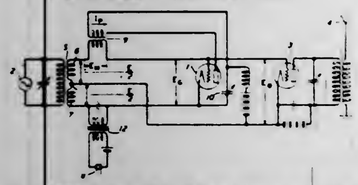
2,001,104
FASTENER-APPLYING IMPLEMENT
Arthur H. Maynard, Warwick, R. I., assignor to Boston Wire Stitcher Company, Portland, Maine, a corporation of Maine
Application April 5, 1933, Serial No. 664,568
25 Claims. (Cl. 1—3)



1. In an implement of the type indicated, the combination of a frame having a substantially flat base with a longitudinal slot open on its under side, fastener-applying means carried by said frame, a core adapted to support a series of fasteners to successively feed them to the applying means, said core having runners on its sides, and means on the outer sides of the base of the frame engageable with the runners by sliding the core into the slot to support the core in operative position on the frame.

2,001,105
REFRIGERATOR AND TEMPERATURE CONTROL DEVICE
Virginius W. Moody, Brooklyn, N. Y., assignor of two-thirds to Reynolds Metals Company, New York, N. Y., a corporation of Delaware, and one-third to Robertshaw Thermostat Company, Youngwood, Pa., a corporation of Pennsylvania
Application June 22, 1933, Serial No. 677,006
8 Claims. (Cl. 62—91.5)

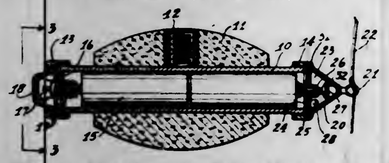
1. In a refrigerating system energized by a substance disposed to gasify when heated, a body of circulatory cooling fluid dissipating heat to said substance, a circulatory system through which said fluid circulates and having an intake end leading from said fluid body and an end discharging into said body, means for effecting a pressure from said gas for forcing said liquid into the intake end of said circulatory system, and means permitting the discharge of said circulatory system into said fluid body only incident to a selected state of depletion of said fluid body.



2,001,106
SHOW CASE
John E. Mullen, San Francisco, Calif., assignor of one-half to H. L. Judell & Company, San Francisco, Calif., a corporation of California
Application August 14, 1933, Serial No. 684,986
2 Claims. (Cl. 312—138)

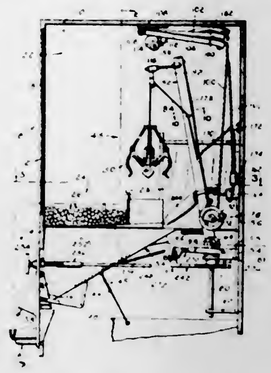
1. A show case construction comprising a receptacle having fixed end, bottom and front walls and a narrow back wall section closing a small portion of the back of the receptacle which is less than the height of the front wall, the back and top edges of the end walls being arranged at an acute angle relative to each other, a closure structure comprising a top wall and a back wall section rigidly connected together at an angle corresponding to the angle of said end wall edges, said back wall section of the closure extending from the top edge of the fixed narrow back wall section to the top of the receptacle, means for hingedly connecting the two sections of the back wall to permit the closure structure to swing from its closed position rearwardly into an open position and stop means for arresting opening swinging movement when the center of gravity of the closure structure is behind said hinge connection, the top wall of the closure structure being substantially horizontal when the same is in full open position.

2,001,107
PHASE MODULATING SYSTEM
Juichi Ozawa, Mita, Shibaku, Tokyo, Japan, assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application July 31, 1934, Serial No. 737,696
In Japan August 24, 1933
6 Claims. (Cl. 179—171)



1. A phase modulating system comprising a vacuum tube with a cathode, an anode and a control grid, a divided carrier source with accessible midpoint, the outer terminals of said source being connected respectively to the grid and the cathode of the tube, means to feed back a carrier wave from the anode circuit to the grid circuit in quadrature with the instantaneous carrier voltage between the grid and the cathode, a load circuit bridged between the midpoint of the carrier source and the grid of the tube, and a signal source adapted to vary the anode current of the tube, whereby the phase of the carrier voltage across the load circuit is varied at a signal rate while the amplitude of said carrier voltage is rendered substantially independent of the signal.

2,001,108
STABILIZED HYDROCARBON OIL
Charles K. Parker, Richmond, Calif., assignor to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
No Drawing. Application July 6, 1931, Serial No. 549,085
8 Claims. (Cl. 87—9)



1. A stabilized mineral oil containing a calcium naphthenate in amounts of between about 0.05% and 2.0%.

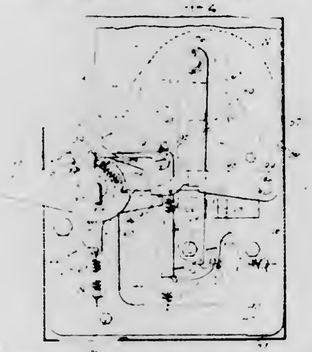
2,001,109
FISH LINE FLOAT
Carlton J. Petrie, Montour Falls, N. Y.
Application September 4, 1934, Serial No. 742,548
11 Claims. (Cl. 43—17)

1. The combination of a fishing line and a self-contained float cooperatively attached to the line and which float means comprise a tubular member having a buoyancy medium disposed about the tube and between the respective tube extremities, an electric lamp bulb mounted at one extremity of said tubular member, a transparent protective cover for the bulb and which cover hermetically seals the bulb therebehind, an automatic gravity actuated control switch including a hood wall and a pellet located outwardly beyond the opposite tube extremity, and a battery arranged within said tube in an operatively interposed relation between said switch and the bulb.

2,001,110
BULK DISPENSING DEVICE
William Rabkin, New York, N. Y.
Application November 15, 1932, Serial No. 642,814
54 Claims. (Cl. 221—146)

1. In bulk dispensing apparatus for discharging from a storage a quantity of bulk material contained in the storage, means for separating a charge of material from the mass in storage, a boom for carrying the separating means, and means for swinging the boom for determining the point in the mass where the separating means will become effective, the boom swinging means including means for predetermining an actual point laterally and longitudinally of the storage mass at which the separating means will become effective.

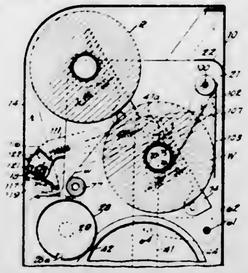
52. The combination with a bulk-dispensing apparatus in which the bulk material is picked up from a storage mass by a grab device and then conveyed to a discharge outlet at which the charge of material is discharged, of a chute communicating with the outlet, a guard valve closing the bottom end of the chute, and a movable false bottom for the chute, the false bottom being vibrated when the valve is pivoted to open position for discharging material from the chute.



2,001,111
MOTOR MOUNTING
Omer E. Rhodes, Aberdeen, and Frank L. Rockwell, Cosmopolis, Wash.
Application February 7, 1934, Serial No. 710,114
2 Claims. (Cl. 248—15)

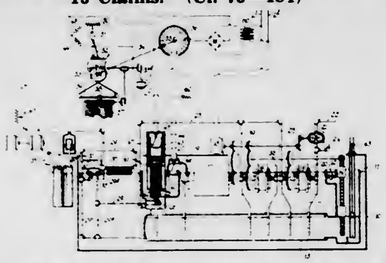
2. A motor mounting consisting of a base member having a plurality of ramps disposed thereon, slotted motor mounting plates having downturned and inclined lugs formed thereon adapted to engage the inclined surfaces of said ramps and to slide thereon in a manner to provide a parallel movement at the line of motor fasten-

ing, and a removable bolt extending through one end of said base and through the downturned lugs of said slotted plates.



2,001,112
DUAL PURPOSE SEAT COVER AND TOWEL FORMING MACHINE
George Schaefer, Jr., Flushing, N. Y., assignor to Sanitary Public Service Corporation, New York, N. Y., a corporation of Delaware
Application December 19, 1933, Serial No. 703,100
43 Claims. (Cl. 164—68)

19. A machine having a cycle of operations for severing a web to form seat covers with flaps or towels one at a time from a web, including a fixed female roller and a movable male roller, the rollers meshing together and having end severing devices which transversely cut the web at regular distances to separate the articles and flap severing devices for forming a flap in each such article when desired, a pressure roller pressing the paper against the female roller and acting to draw the paper past the severing devices, a pivoted hanger in which the male roller is journaled, the hanger being movable to separate the male and female rollers so that neither severing devices may function, or bring them together so that both severing devices may function, a releasable latch for holding the hanger in the latter position, a spring for shifting it to the former position upon release of the latch, means for releasing the latch prior to the functioning of the flap severing devices whenever the flapless article is desired, and means for relatching the released hanger before the end severing devices are to function so that the articles are severed from the web, said releasing means being interconnected with a releasable stop mechanism which stops the machine after the completed article is passed beyond the pressure roller.

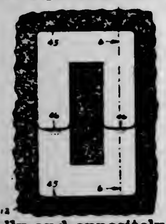


2,001,113
MACHINE FOR HANDLING STRIP MATERIAL
George Schaefer, Jr., Flushing, N. Y., assignor to Sanitary Public Service Corporation, New York, N. Y., a corporation of Delaware
Application December 19, 1933, Serial No. 703,101
22 Claims. (Cl. 242—58)

18. In a web replenishing mechanism, a roller about which an active web may be partially wrapped, a blade parallel with the roller, means to hold the blade out of contact with the roller or the active web, a clamp parallel with the blade and bodily movable therewith, the clamp being adapted to secure the end of a reserve web which has been carried about the free edge of the blade, and means to guide the blade upon its release to

move the reserve web into contact with the active web and roller.

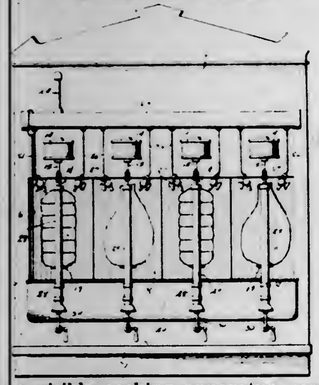
2,001,114
METHOD OF AND APPARATUS FOR ASCERTAINING THE PROPORTIONAL VALUE OF A COMBUSTIBLE CONSTITUENT OF A FLOWING FLUID
Edwin X. Schmidt, Whitefish Bay, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Application January 8, 1931, Serial No. 507,384
13 Claims. (Cl. 73—184)



1. The method of continuously ascertaining the instantaneous proportional value of a constituent of a gaseous fluid, which comprises the steps of supplying to a burner a continuous metered flow of said fluid, supplying to said burner a continuous flow of another fluid, mixing said fluids and igniting the mixture whereby said constituent of the first-mentioned fluid combines chemically with at least a portion of said second-mentioned fluid to generate heat, continuously ascertaining the value of the total heat generated per standard cubic foot of said first-mentioned fluid, and utilizing said value as a direct indication of the proportional value of said constituent.

7. The method which comprises mixing streams of flue gases and air of equal volume, effecting combustion of the mixture in the presence of an excess of flowing hydrogen, effecting a separate metered flow of cooling fluid in heat exchanging relation to the products of combustion, ascertaining the difference in temperatures of said last mentioned fluid before and after the heat exchange, and utilizing the value of the difference so ascertained as a measure of the percentage content of oxygen in said flue gases.

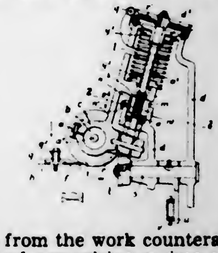
2,001,115
CHANGEABLE SIGN DEVICE
Lester C. Shaw, Alameda, Calif., assignor of one-half to Cyril M. McKee, Oakland, Calif.
Application June 15, 1933, Serial No. 675,895
2 Claims. (Cl. 40—143)



2. In a changeable sign, a backing plate provided with tongue-receiving slits, means for defin-

ing a changeable sign character on said plate and comprising a plurality of elements for mutual and variable overlapping to cooperatively define any one of a series of sign characters, and tongues

extending laterally and oppositely from said elements for engagement in appropriate said slits of the plate whereby to secure an assembly of the elements on the plate in character-defining relation.



2,001,116
BARBECUING STOVE
Leonard G. Smith, Miami, Fla.
Application May 6, 1933, Serial No. 669,751
2 Claims. (Cl. 272—8)

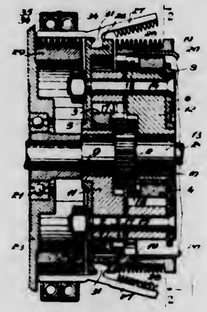
1. In a visible cooking apparatus, means for suspending and rotating an article as if for cooking, a concavely curved reflector extending approximately the full length of the space occupied by the article, the reflector being approximately concentric to the axis of rotation of the article, and an illuminating means giving off a glow simulating the glow of hot coals and disposed between the supported object and the reflector and hidden by the object when the latter is so suspended.

2,001,117
RAZOR BLADE GRINDING MACHINE
Werner Tobias, Berlin-Sudende, Germany, assignor to Aktiebolaget Tonsor, Gottenburg, Sweden
Application November 26, 1932, Serial No. 644,471
In Germany December 4, 1931
2 Claims. (Cl. 51—74)

1. A grinding machine for grinding cutting edges on a continuously progressing steel band, comprising means to continuously feed the steel band, guides to hold and support the portion of the steel band to be momentarily worked, a grinding disc arranged opposite said guides, a slide carrying the disc, a pedestal in which the said slide is displaceable in a direction perpendicular to the disc axis, a spring arranged in the pedestal and adapted to urge the slide in a direction to engage the portion of the work guided between said guides, an adjustable abutment adapted to determine the working end position of the slide, and manually actuated means for disengaging

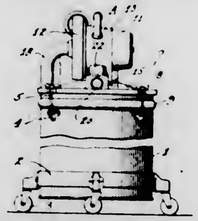
the disc from the work counteracting to the said spring and comprising a cam roller and a cam arranged on the slide and the pedestal of the machine, respectively, and co-operating with each other but being out of contact during the working of the disc.

2,001,118
RESILIENT CALK FOR HORSESHOES
Carl G. Akerberg, Oshkosh, Wis., assignor to Giant Grip Manufacturing Company, Oshkosh, Wis., a corporation of Wisconsin
Application April 19, 1934, Serial No. 721,386
3 Claims. (Cl. 168—41)



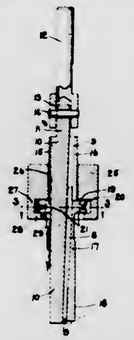
1. A horseshoe calk comprising a resilient pad member; a metallic insert having a hollow upper extension for engagement with a horseshoe and lower flanged portions embedded in said pad and providing a concavity for receiving some of the resilient material of said pad; and means interconnecting and reinforcing said flanged portions and adapted to strengthen the bond between said pad and said flanged portions by retaining said pad material within said concavity.

2,001,119
PISTON RING
Harry Francis Bedwell, Lyons, Ind.
Application February 16, 1934, Serial No. 711,582
1 Claim. (Cl. 309—45)



An oil ring for use on the piston of an internal combustion engine comprising a resilient split ring having opposed flat faces, there being an annular rabbet extending into the outer surface of the ring from its lower edge and formed with an upper wall inclined downwardly to provide a scraping edge at the outer periphery of the ring, and a series of annularly spaced slots extending inwardly from the rabbet at the center of the ring and in a plane parallel with the flat faces of the ring, said slots increasing in length away from the rabbet, that portion of the wall of the rabbet between the slots and the wall being inclined downwardly and outwardly to provide an oil receiving space of increased area between the slots and the scraping edge, there being channels in those portions of the wall of the rabbet between the slots and terminating at the ends of the slots for trapping oil and deflecting it to the slots.

2,001,120
CLUTCHING DEVICE
Wilhelm Brase, Berlin, Germany
Application February 9, 1934, Serial No. 710,453
In Germany November 27, 1933
10 Claims. (Cl. 192—79)

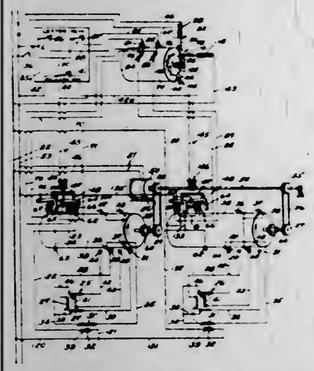


1. In a clutching device, the combination of a driving member, a driven member, one member having substantially cylindrical clutch surfaces, a plurality of levers arranged axially around the other member in clutching relation with said surfaces, a spring ring encircling said levers, and means for axially moving said ring to urge said levers into clutching engagement with said surfaces.

2,001,121
PORTABLE SUCTION CLEANER
Adam A. Breuer, Chicago, Ill.
Application August 30, 1934, Serial No. 742,055
2 Claims. (Cl. 183—90)

1. A suction cleaner adapted to clean furnaces and the like, comprising a tank open at the top, a cover removably secured on said tank, suction producing mechanism mounted on top of said cover, an outlet conduit connected to the intake of said mechanism and extending through a portion of said cover to provide communication with the interior of said tank, an inlet conduit extending through another portion of said cover in substantially horizontal direction, said inlet conduit having a portion thereof extending outwardly of said cover and adapted to receive a hose, and a curved wall formed as a part of said cover and disposed adjacent the discharged end of said inlet to divert the incoming suction stream from direct travel to the outlet and to impart swirling motion to the stream in said tank to lengthen the path of travel thereof and to facilitate the precipitation of solids in said stream.

2,001,122
LAP
Arthur J. Brickner, Muskegon Heights, Mich., assignor to Brickner-Kropf Machine Company, Muskegon, Mich., a corporation of Michigan
Application September 24, 1934, Serial No. 745,283
5 Claims. (Cl. 51—184.1)



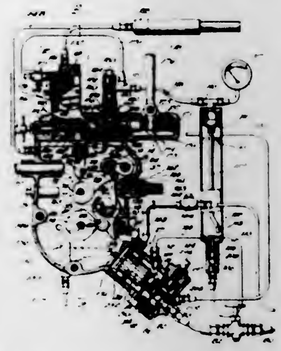
5. A lapping tool of the class described comprising, a body member having a plurality of runways extending from one end thereof, said runways being grooved to a substantially constant depth, a shoe for each runway, a rib on each shoe, said rib being tapered in depth from nothing to substantially the depth of said grooves and fitting in one of said grooves and the surfaces of the shoes and runways being so formed as to cause the shoes to move radially as they are slid longitudinally, and means encircling the shoes for reciprocating the same.

2,001,123
STABLE CHROMIUM-NICKEL-IRON ALLOY
Vere B. Browne, Brackenridge, Pa., assignor to Allegheny Steel Company, Brackenridge, Pa., a corporation of Pennsylvania
Application September 22, 1933, Serial No. 690,537
5 Claims. (Cl. 75—1)

4. A welded article for use in the chemical, metallurgical and physical fields, which without being annealed after welding is not susceptible to intercrystalline corrosion when in contact with corrosive media and which is made from a steel containing between 15–30% chromium, 6–16% nickel and carbon from .07–.20%, the nickel content being from 30–70%, of the chromium content, such steel being characterized by definite sluggishness and reluctance to dissociate when heated within the range of decomposition and in which the minimum combined chromium and nickel in relation to the carbon content is in accordance with line A—B of the graph.

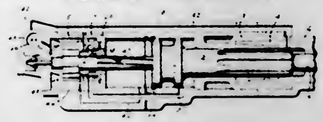
2,001,124
DEVICE FOR TRANSMITTING INTELLIGENCE
Gordon A. Cooke, Pasadena, Calif.
Application April 19, 1930, Serial No. 445,669
12 Claims. (Cl. 177—349)

1. In combination in an intelligence transmitting device: a character assembly comprising a plurality of character elements disposed to form symbols when certain groups thereof are illuminated, each of said character elements comprising a gaseous discharge tube; a transformer having a low voltage primary winding and a high voltage secondary winding; selector means providing terminals electrically connected to said character elements and successively connecting said secondary winding of said transformer to different groups of said character elements; stop means associated with said selector means and stopping said selector means by mechanical engagement therewith when a desired group of said character elements are connected thereto; and means including said stop means for energizing said primary winding after said secondary winding has been connected to said last named group of character elements.



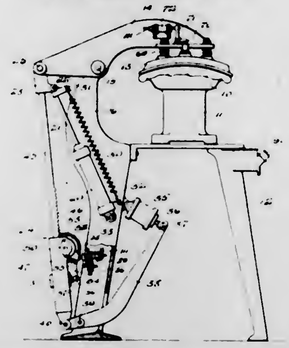
2,001,125
MANUFACTURE FROM RUBBER LATEX OF RUBBER ARTICLES CARRYING IMPRINTS
James Barret Crockett, Cambridge, Mass.
Application June 25, 1929, Serial No. 373,686
9 Claims. (Cl. 41—33)

2. A method which comprises applying rubber latex to a printed paper surface, drying the latex in applied position, and stripping the dried latex from the material, thereby taking off the printing medium and many of the fibers of the paper embedded in the latex.



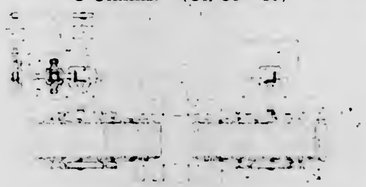
5. As an article of manufacture, a rubber article consisting of dried and vulcanized rubber latex surfaced with fibers embedded in the body of such latex and carrying an ornamental ink imprint thereon.

2,001,126
FUEL PUMP AND DISTRIBUTING APPARATUS FOR INTERNAL COMBUSTION ENGINES
Clessie L. Cummins, Columbus, Ind., assignor to Oil Engine Development Company, Columbus, Ind., a corporation of Indiana
Application March 22, 1930, Serial No. 438,048
25 Claims. (Cl. 123—138)



1. In a fuel feeding and distributing apparatus for a multi-cylinder, oil burning engine, the combination of a fuel pump of the plunger type having a single piston for feeding fuel to the cylinders, means for charging the pump with fuel under pressure, and distributing mechanism comprising a stationary member and a moving member each provided with passages through which the pump is alternately charged with fuel by the charging means and discharges fuel to the respective cylinders, the pump and moving member being mechanically driven in timed relation to the engine.

2,001,127
ROCK DRILL
John C. Curtis, Garfield Heights, Ohio, assignor to The Cleveland Rock Drill Company, Cleveland, Ohio, a corporation of Ohio
Application May 7, 1934, Serial No. 724,293
7 Claims. (Cl. 121—10)

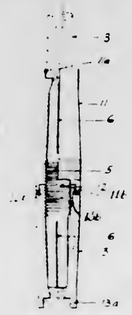


1. In a rock drill, the combination of a cylinder having a fluid actuated piston reciprocable therein, of a hollow tool implement slidable within the front end of the machine, of a fluid actuated valve member reciprocable in time relation with said piston for controlling the admission of the piston actuating pressure fluid into said cylinder, a passage controlled by said valve member being open thereby during the stroke of said piston in one direction for admitting compressed fluid from the interior of said cylinder to the bottom of the hole being drilled via said hollow tool implement, and being closed by said valve member during the stroke of said piston in the other direction.

2,001,128
GARMENT OR IRONING PRESS
Ernest Davis, Syracuse, N. Y., assignor to The Prosperity Company, Inc., Syracuse, N. Y., a corporation of New York
Application June 14, 1930, Serial No. 461,105
16 Claims. (Cl. 68—9)

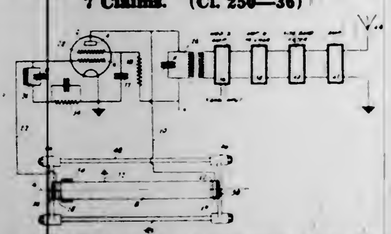
1. A garment or ironing press comprising cooperative pressing elements, one of which is movable toward and from the other; actuating means for the movable pressing element including an extendible link having sections slidable relative to one another; means for locking the link sections against relative sliding movement; controlling means for the locking means, and means operated by the pressure between the pressing elements for effecting the operation of the controlling means.

2,001,129
TABLE FOR ROLLING MILLS
Ernest Drexler, Pittsburgh, Pa.
Application November 5, 1934, Serial No. 751,502
3 Claims. (Cl. 80—47)



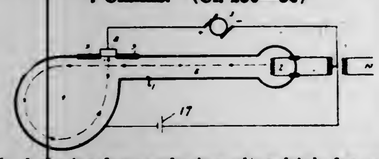
1. A table for rolling mills comprising a wheeled carriage inclusive of spaced side rails, track rails on which said carriage is mounted for movement, means for securing said carriage against movement along said track rails, a series of material supporting and conveying rollers mounted on and extending transversely between the carriage side rails, means for driving all of said rollers in the same direction, a frame inclusive of side rails disposed outwardly of the carriage side rails, a series of material supporting and conveying rollers mounted on and extending transversely between the frame side rails, means for driving all of the rollers of the second series in a direction opposite to the rollers of the first series, means whereby the frame rollers are permitted to move downwardly below the carriage rollers, a support, vertically movable frame lifting means mounted in said support, and a detachable connection between said frame lifting means and said frame whereby the frame and its rollers may be deposited on the carriage for movement therewith.

2,001,130
REVETMENT
John R. Fordyce, Hot Springs, Ark.
Application December 3, 1932, Serial No. 646,471
4 Claims. (Cl. 61—38)



1. In the art of protecting revetments, the process comprising, heating normally hard asphaltum to a temperature substantially above its softening point, mixing mineral aggregate with the asphaltum, working the hot asphaltum-aggregate mixture about a substantially flat reenforcing network to form a self-sustaining sheet, and launching the sheet before the mixture cools to below the hardening temperature.

2,001,131
SOLDERLESS CONNECTER FOR ELECTRIC CONDUCTING CABLES
Henry C. Guhl, Haven, Kans.
Application January 10, 1933, Serial No. 650,976
1 Claim. (Cl. 173—268)

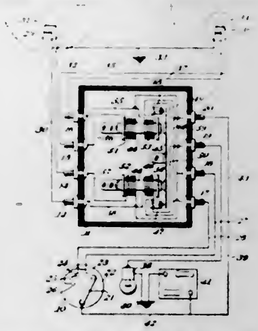


In a clamping connecter for the meeting end portions of two cables, the combination of two female members each having one end internally threaded, each female member also having therein a long and gradual taper that extends from the threaded part outward, and a dual male member having its intermediate part externally threaded and adjustably fitted in said intermediately threaded parts, said male member also having two annular arrangements of flexible elongated clamping jaws surrounding two spaces for receiving the meeting cable-ends, said jaws having only a minute portion of their free ends normally against the intermediate tapered parts and thereby pressed centripetally into engagement with the cable-ends, a very large proportion of the jaws being spaced from said long and gradual tapers, the said female members being of electric-insulating material and being formed with annular flanges that interlap with one another at their internally threaded ends so as to fully cover said externally threaded part in the different adjustments of the members relative to one another, the outer ends of said female members having annular flanges to overlap the insulation on said meeting end portions of the cables.

2,001,132
OSCILLATION GENERATION
Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application July 18, 1930, Serial No. 468,890
7 Claims. (Cl. 250—36)

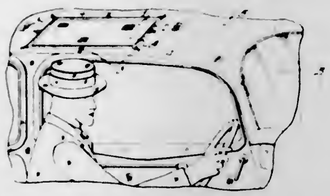
1. In apparatus for transforming direct energy to alternating energy, said apparatus including a vibrator whose length is effectively a whole number of half wave lengths of its fundamental frequency, the method of generating alternating energy of predetermined frequency which is determined by the length of said vibrator which includes producing, with a portion of the transformed direct energy taken from the apparatus, traveling mechanical waves along the length of said vibrator at the predetermined frequency, transforming the mechanical waves to waves of electrical energy and feeding the electrical energy so derived to the apparatus to control the frequency of the alternating energy generated.

2,001,133
HIGH FREQUENCY OSCILLATOR
Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application July 28, 1930, Serial No. 471,309
7 Claims. (Cl. 250—36)



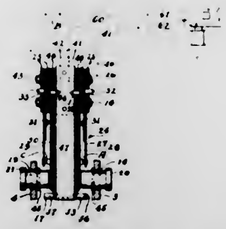
1. A device for producing ultra-high frequency oscillations, comprising a filament for emitting electrons, an anode for attracting electrons, and means for causing the stream of electrons to travel in a curved path so as to cross itself, said means comprising a curved shell which has a potential at least as negative as that of the filament, the anode being positioned in an opening in the curved shell and insulated therefrom.

2,001,134
METAL POWDER
Charles Hardy, Pelham Manor, N. Y., assignor to Hardy Metallurgical Company, a corporation of Delaware
No Drawing. Application February 6, 1933, Serial No. 655,479
4 Claims. (Cl. 75—1)



1. A method of manufacturing a metal object of die-cast configuration which comprises forcing a portion of the metal in the form of finely divided closely graded powder with metallic surfaces which are coated with metallic soap under adequate pressure into a die to cause the powder to cohere at an appropriate density into an object of the desired configuration, and then subjecting the object thus formed to a heat-treatment operation until substantially all of the metallic soap is decomposed and, the powder particles are welded into a substantially homogeneous mass.

2,001,135
HEADLIGHT PROVING APPLIANCE
Luther R. Harmon, Milwaukee, Wis.
Application February 1, 1934, Serial No. 709,387
2 Claims. (Cl. 177—311)



1. In combination with the lighting system of a motor vehicle having a plurality of lighting units, a plurality of filaments in each of said units, a filament of one unit corresponding with a filament in the other unit, a plurality of relay cores corresponding in number to the number of units, a plurality of windings on each of said cores corresponding in number to the number of filaments in each of said units, a source of current, circuits for connecting corresponding filaments in parallel with each filament in series with a corresponding relay coil, switch means for selectively closing any one of said parallel circuits and for simultaneously closing a plurality of said circuits, and a signal circuit including a switch means controlled respectively by the core with which it is associated, and a proving device in said signal circuit.

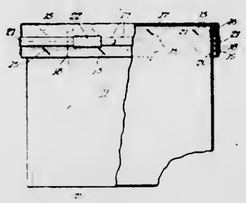
2,001,136
REMOVABLE WALL-LINING
George Holderbach, St. Louis, Mo., assignor to Evr-Klean Seat Pad Company, St. Louis, Mo., a corporation of Missouri
Application July 30, 1934, Serial No. 737,624
4 Claims. (Cl. 45—138)

1. As a new article of manufacture, a covering or lining including a body-member, elastic strips endwise fixed to, and disposed in spaced relation along, the margin of the body-member, and hooks carried by said strips for detachably securing the body-member flatwise to and upon a wall or the like.

2,001,137
ALARM SWITCH
Richard M. Hopkins, New York, N. Y., assignor to American District Telegraph Company, New York, N. Y., a corporation of New Jersey
Application November 30, 1929, Serial No. 410,718
10 Claims. (Cl. 200—167)

1. In combination, a pair of normally closed switches changeable from closed to open position; a movable indicating means; and means for mounting and guiding the indicating means; said indicating means being engaged by the switches and thereby held against movement from normal to indicating position when either switch is in normal condition, and being released to move to indicating position whenever both switches are open.

2,001,138
SEALING MEANS
Harold E. Johnson, Evanston, Ill., assignor to Chicago Rawhide Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application September 11, 1931, Serial No. 562,377
7 Claims. (Cl. 288—1)



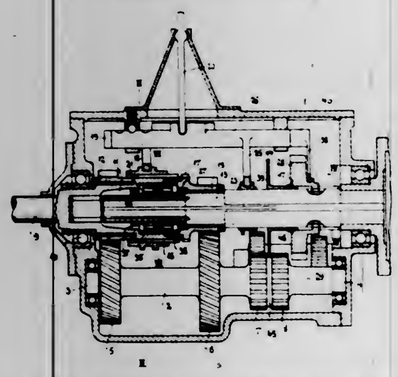
6. A self-contained sealing unit comprising a cup-shaped sheet metal holder, a flanged packing ring positioned against the bottom of the holder with the flange so arranged as to seal against a rotating shaft passing through the holder, a thin sheet metal spring ring positioned against the packing ring and provided with a large number of closely arranged tongues in spring-pressed engagement with said flange, a single sheet metal closure ring positioned under pressure against the tongues of the spring ring, with the tongue-engaging portion of the closure ring located in a plane which is spaced axially a substantial distance from both the edge of the rim of the holder and the edge of the flange of the packing ring, and an inturned locking flange on the edge of the rim of the holder having clamped engagement with a radially extending flange on the closure ring, said closure ring being spaced inwardly from the rim of the holder at all points except at the edge of the holder.

2,001,139
BOOK HOLDER
William V. Johnson, Washington, D. C.
Application April 19, 1934, Serial No. 721,392
4 Claims. (Cl. 45—57)

1. As a new article of manufacture, a pair of elongated plates, means for hingedly connecting marginal portions of said plates to allow said plates to be disposed one over the other, outstanding flanges carried by the opposite longitudinal margins of the plates, said flanges lapping when the plates are in folded or compacted adjustment, and pads of yielding material carried by the flanges of one of the plates and disposed over the inner faces of said flanges for engagement with the leaves of an applied book to hold said leaves against accidental turning, the top surfaces of the pads being disposed on a transverse downward incline toward the adjacent plate.

2,001,140
CONTAINER
Isaac N. Jordan, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
Application April 15, 1933, Serial No. 666,254
4 Claims. (Cl. 229—45)

1. A container comprising a body member open at the top and provided with a marginal external bead about the opening, in combination with a cover member therefor comprising a sheet notched at its several corners and bent on lines connecting the apexes of the notches to provide about its margin downwardly extending independently hinged flanges each provided with a marginal internal bead adapted to take over and interlock with the body bead when the flanges are swung inwardly against the sides of the body, and exteriorly disposed means to con-



fine the flanges about the body with the beads interlocked, said confining means readily releasable to permit disengagement of the interlocking beads and removal of the cover upwardly.

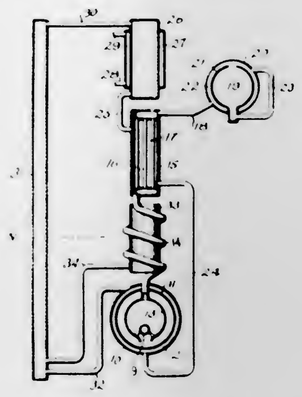
2,001,141

TRANSMISSION FOR TRANSMITTING POWER AT DIFFERENT SPEED RATIOS FROM A DRIVER SHAFT TO A DRIVEN SHAFT

Coom Kittilsen, Lille Trag, near Porsgrunn, Norway

Application March 5, 1934, Serial No. 714,191
In Norway July 31, 1933
2 Claims. (Cl. 74—339)

1. A transmission for transmitting power at different speed ratios from a driver shaft to a driven shaft, arranged substantially in alignment with each other, and comprising an auxiliary lay shaft and two sets of gears in constant mesh with each other, one gear of each of these sets being mounted fixed to the said lay shaft and the other two gears respectively being rotatably mounted on the driver shaft and on the driven shaft, a sliding clutch being arranged non-rotatable on the end of the driver shaft and being provided with means for connecting one or the other of the said freely mounted gears directly to the driver shaft, the said driver shaft being hollow at its end and the said driven shaft having an extension projecting into said hollow, the internal diameter of the driver being so large in relation to the said extension of the driven shaft that a free annular space will remain between them, a sliding clutch being arranged on the said end of the driven shaft and means being arranged on the driver shaft and on the gear, freely mounted on the driven shaft to adapt the said clutch to engage alternately with the said driver shaft and with the said freely mounted gear on the driven shaft.



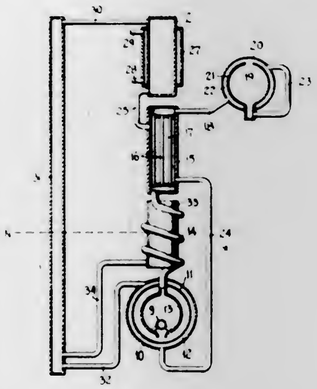
2,001,142

INTERMITTENT ABSORPTION REFRIGERATING APPARATUS AND METHOD

Donald B. Knight, Brooklyn, N. Y., assignor to Electrolux Servel Corporation, New York, N. Y., a corporation of Delaware

Application March 18, 1931, Serial No. 523,394
30 Claims. (Cl. 62—5)

15. In the art of refrigerating with intermittent absorption apparatus, supplying volatile liquid to cool the condenser by vaporization during the generating cycle, transferring the liquid to cool the generator-absorber by vaporization during the refrigerating cycle, condensing the vapor-



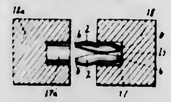
ized fluid, and returning the liquid to the part being cooled.

2,001,143

INTERMITTENT ABSORPTION REFRIGERATING APPARATUS

Donald B. Knight, Brooklyn, N. N. Y., assignor to Electrolux Servel Corporation, New York, N. Y., a corporation of Delaware

Application March 18, 1931, Serial No. 523,395
12 Claims. (Cl. 62—118)



12. A refrigeration system including an evaporator, a receiver, a condenser, apparatus for causing alternate expulsion and absorption of refrigerant fluid with respect to an absorbent therefor, said condenser being connected to receive expelled refrigerant vapor, means to conduct condensed refrigerant liquid from said condenser to said receiver, said evaporator being connected for flow of refrigerant vapor therefrom to said absorption apparatus, and a thermosyphon for delivering liquid from said receiver to said evaporator.

2,001,144

DOWEL PIN

Rudolf Krnanský, Montreal, Quebec, Canada

Application April 9, 1934, Serial No. 719,713
5 Claims. (Cl. 20—92)

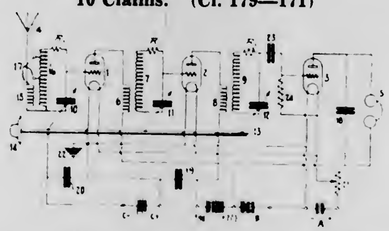
1. A dowel pin comprising two similar semi-cylindrical parts, having their inner-contacting surfaces receding from the middle towards their ends.

2,001,145

ART OF RIVETING

Albert L. Lambert, Narberth, and William J. Meinel, Philadelphia, Pa., assignors to Heintz Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

Application January 29, 1934, Serial No. 708,731
1 Claim. (Cl. 78—46)



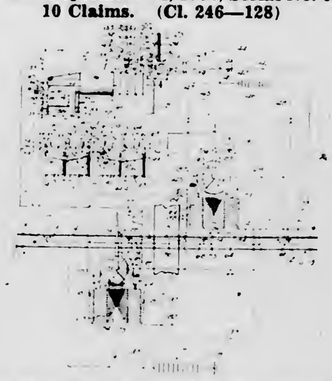
Riveting of the character described which includes placing a washer of chrome steel about an annular curved groove provided adjacent one end of a rivet pin protruding from the parts to be riveted, the washer being substantially the same width as the groove, and cold working the washer to flow the washer as a whole to fill the groove and into tight contact with the parts to be riveted, the said working being sufficient to substantially increase the tensile strength of the washer.

2,001,146

PRETUNED RADIORECEIVER AND METHOD OF PRODUCING SAME

Harold M. Lewis, Bradley Beach, N. J., assignor to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Original application April 14, 1926, Serial No. 101,848. Divided and this application March 4, 1927, Serial No. 172,603
10 Claims. (Cl. 179—171)



1. In a radio receiver, a plurality of thermionic tubes in cascade, each tube having an anode, cathode and at least one grid, a tunable oscillatory circuit connected between the cathode and grid of each tube, each of said oscillatory circuits including a variable tuning condenser, a conductive, actuating shaft having the rotor units of the said condensers directly affixed thereto in spaced relation along the length of the shaft thereby electrically connecting the respective rotor units of the condensers at a common potential, the shaft being arranged to operate said units in unison, a common means for maintaining the grids of said tubes, said shaft and rotor units biased at a common potential which is more negative than that of the cathodes, and a capacitive path of low impedance for radio frequencies directly connected between said conductive actuating shaft and the cathodes.

2,001,147

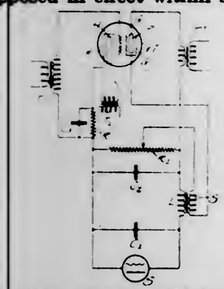
AUTOMATIC RAILWAY CROSSING GATE

Alfred E. McClaren, Joplin, Mo.

Application September 14, 1932, Serial No. 633,169
10 Claims. (Cl. 246—128)

1. Apparatus of the character described comprising a gate for a railway grade crossing, means for operating said gate to move it between vertical inoperative position and horizontal operative position, said operating means comprising a gate lowering solenoid device and a gate raising solenoid device each having a circuit therefor, a switch normally closing the circuit through the second named solenoid device and movable to operative position for closing the circuit through the first named solenoid device, an operating magnet for said switch energizable to move said switch to operative position, and control means for said operating magnet comprising a solenoid energizable by a train passing a predetermined point in advance of the grade crossing, an armature for said solenoid having means for retarding its movement upon energization of the solenoid, said armature also having means tending to urge it to normal position upon deenergization of said solenoid to close a circuit through said operating magnet, and a track device arranged between the grade crossing and said predetermined point and operative by a train passing thereover for deenergizing said solenoid.

2,001,148



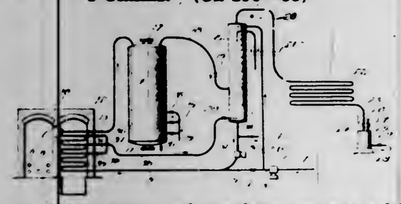
SYSTEM FOR ENERGIZING SPACE DISCHARGE DEVICES

Benjamin F. Miessner, Short Hills, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application May 3, 1929, Serial No. 360,045
Renewed October 22, 1931
20 Claims. (Cl. 179—171)

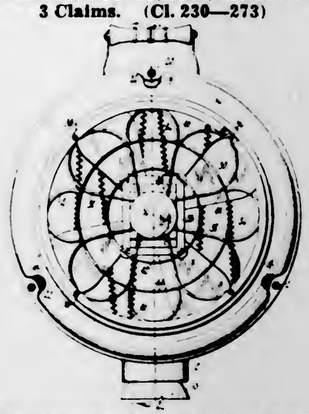
1. An amplifier system including a vacuum tube having a cathode, control grid, anode and an anode shield grid electrode, input and output signal current circuits, connections for energizing said control grid and anode electrodes from the some source of unidirectional pulsating current, a connection for energizing said anode shield grid electrode, and means for impressing upon

said last named connection pulsations from said source opposed in effect within said tube to the



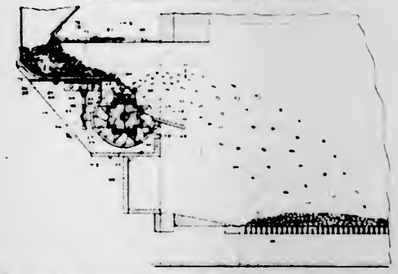
resultant effect of said pulsating energizing of said control grid and anode electrodes.

2,001,149
RETAILING CONTAINER FOR FRUIT AND THE LIKE
Carl Monschein, Vienna, Austria, assignor of one-fourth to Gerhard Greiner and one-fourth to Josef Reitner, both of Vienna, Austria
Application February 17, 1934, Serial No. 711,750
In Austria June 17, 1932
3 Claims. (Cl. 229—53)



1. A collapsible container for fruit consisting of two similarly shaped bags of flexible material placed one within the other and stuck together at opposite points with the formation of a pocket therebetween, the inner of the said bags being closed and perforated at the bottom, and the outer of the said bags having an outlet aperture at the bottom.

2,001,150
HYDROCARBON OIL CONVERSION
Edwin F. Nelson, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of South Dakota
Application May 9, 1928, Serial No. 276,264
8 Claims. (Cl. 196—58)



1. A hydrocarbon oil cracking process which comprises passing the oil in a restricted stream through a heating coil wherein the oil is heated to cracking temperature, removing from the coil a portion of the oil passing therethrough and discharging the remainder thereof into a vapor separating zone, separately removing vapors and unvaporized oil from said zone and subjecting the former to dephlegmation to condense insufficiently cracked fractions thereof as reflux condensate, and re-boiling said reflux condensate by admixing the same with said portion of the oil removed from said coil.

2,001,151
MOTOR SUPPORT FOR AIR CIRCULATORS AND HEATERS
Eugene Newnham, St. Louis, Mo., assignor to Knapp-Monarch Company, Belleville, Ill., a corporation of Missouri
Application December 19, 1932, Serial No. 647,859
3 Claims. (Cl. 230—273)

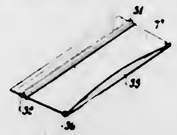
1. A fan motor support comprising a grid member adapted to serve both as a support and as a guard for the fan blades of a fan motor, said motor support having a disc secured to the center portion thereof, means extending through said disc for attaching said motor thereto, a cover plate for said means, said cover plate having ears bent over the edge of said disc.

2,001,152
STOKER FOR FURNACES
George W. Olney, Minneapolis, Minn.
Application April 5, 1930, Serial No. 441,804
5 Claims. (Cl. 110—115)

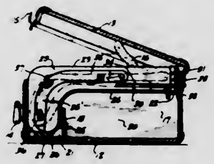
3. In a stoker for furnaces embodying means for delivering and discharging coal in a horizontal plane, a rotor operative below the point of discharge from said means embodying an inner portion more than half the diameter of the paths of the outer limits of its beaters, and provided with a multiplicity of beaters positioned along the longitudinal extent of said inner portion each having an active face with portions diverging from the center of the rotor toward its ends in planes out of the axis of said rotor, the number of said beaters being such that each beater and the active face thereof cooperates with the rear face of the beater ahead of it in moving the coal, and means for revolving the rotor so said active faces move upwardly toward and pass under and near the line of discharge from said delivering and discharging means.

2,001,153
ELECTRICAL CONDENSER
Percival James Packman, Seven Kings, England, assignor to The Plessey Company Limited, Ilford, Essex, England, a British company
Application August 12, 1931, Serial No. 556,481
In Great Britain April 2, 1931
3 Claims. (Cl. 175—41.5)

1. An electrical condenser comprising the combination of a plurality of vanes having apertures therein of volute cross-section and arranged in any desired spaced relationship and a vane supporting member of similar volute cross-section uniformly throughout its vane supporting length, which supporting member is passed through the said apertures and is jammed against the walls of the apertures to support the vanes in spaced relation.



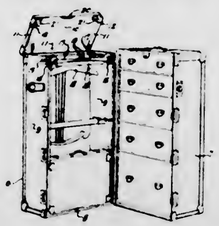
2,001,154
DOUBLE-WALLED VACUUM CONTAINER
Arthur H. Payson, Norwich, Conn., assignor to The American Thermos Bottle Company, Norwich, Conn., a corporation of Ohio
Application May 5, 1934, Serial No. 724,196
3 Claims. (Cl. 91—68.3)



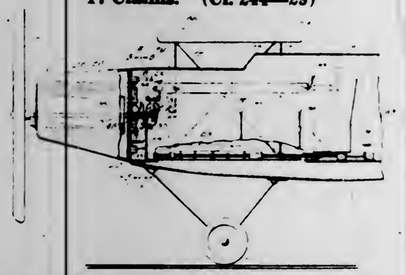
1. In the manufacture of double-walled vacuum containers, the method of forming an unsilvered window in the silvered inner walls of the vacuum space, which method comprises inserting a member into said space and maintaining it in firm contact with opposing portions of said walls along a sufficiently wide area substantially lengthwise of the container, and treating said inner walls with a silvering solution while said member is held in place, whereby the opposing wall surfaces covered by said member remain unsilvered and transparent to serve as a window or sight opening, the inserted member being then withdrawn.

2,001,155
RAZOR BLADE
Peter Nicholas Peters, New York, N. Y.
Application June 21, 1934, Serial No. 731,585
22 Claims. (Cl. 30—12)

1. The method of increasing the rigidity of a cutting edge of an elastic, flexible blade, which consists in flexing said blade about one or more axes transverse to said cutting edge, and flattening out the marginal portion only of the blade containing said cutting edge.

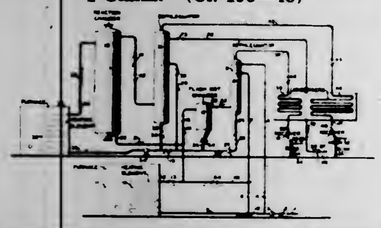


2,001,156
WARDROBE SUITCASE
Julius Ritter, Jr., Racine, Wis., assignor to Hartmann Trunk Company, Racine, Wis., a corporation of Wisconsin
Application June 15, 1934, Serial No. 730,778
12 Claims. (Cl. 190—41)



1. In a wardrobe suitcase, a garment carrier section having a relatively flat portion, a garment hanger detachably mountable within said section, and a garment folding frame carried by said section and extending beyond said flat portion and cooperable with said hanger to fold a garment associated with the latter medially of the length of the garment and to additionally offset the overlapping folded garment portions from the plane of normal draping thereof from said hanger and beyond said flat portion.

2,001,157
CLOSURE GUIDE
Julius Ritter, Jr., Racine, Wis., assignor to Hartmann Trunk Company, Racine, Wis., a corporation of Wisconsin
Application June 21, 1934, Serial No. 731,680
6 Claims. (Cl. 190—13)

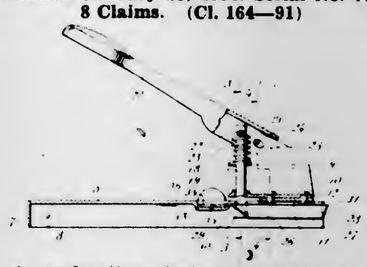


1. In combination, a container having walls, opposite side portions of which are deflectible laterally when the container is fully opened, a cover hingedly connected to said container and swingable toward said wall side portions, and projecting guide members secured within said cover adjacent side portions thereof and cooperable, when the cover is moved toward closed position, with inner surfaces of said container wall portions to prevent and overcome inward deflection of said wall portions out of their normal planes.

2,001,158
FLYING MACHINE
Richard W. Sears, 2d, and James F. Koca, Woodstock, Ill.; said Koca assignor to said Sears, 2d
Application June 12, 1930, Serial No. 460,604
Renewed August 10, 1933
17 Claims. (Cl. 244—29)

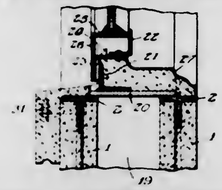
3. In a flying machine, the combination with a supporting frame, of propelling mechanism detachably connected thereto, an aeroplane unit adjustably mounted on said frame, a seat for the pilot, mechanism for shifting said seat forwardly while said unit is shifted rearwardly, and power-operated mechanism controlled by said pilot to release said propelling mechanism to drop the same while said machine is in flight, said power-operated mechanism also operating said shifting mechanism to adjust the center of gravity and the position of said unit to enable the structure remaining in flight to act as a glider.

2,001,159
TREATMENT OF HYDROCARBON OIL
Jean Delattre Segay, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of South Dakota
Application August 16, 1930, Serial No. 475,704
1 Claim. (Cl. 196—48)



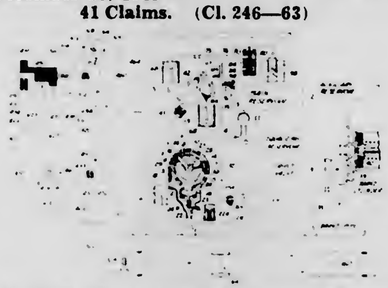
A hydrocarbon oil cracking process which comprises passing relatively clean hydrocarbon distillate in a restricted stream thru a heating zone and heating the same therein to cracking temperature under sufficient pressure to maintain a substantial portion thereof in liquid phase, discharging the heated oil into a vapor separating zone maintained under cracking conditions of temperature and superatmospheric pressure and separating the same therein into vapors and unvaporized oil, removing the separated vapors and dephlegmating the same under superatmospheric pressure to condense insufficiently cracked fractions thereof as reflux condensate, separately removing the unvaporized oil from the separating zone and flash distilling the same in a flashing zone by pressure reduction, simultaneously with the foregoing operation independently heating fresh charging oil for the process, under a pressure higher than that prevailing in the flashing zone and without substantial cracking thereof, to a temperature adequate to distill a substantial portion thereof under the pressure of the flashing zone, introducing the thus heated charging oil, prior to any substantial cracking thereof, to the flashing zone and vaporizing a substantial portion thereof in the flashing zone, removing the admixed flashed vapors and charging oil vapors from the flashing zone, separately removing residuum from the flashing zone and isolating the same from the process, dephlegmating the admixed vapors removed from the flashing zone independently of the vapors removed from the separating zone and under the reduced pressure of the flashing zone to condense heavier fractions thereof by passing the same in indirect heat exchange relation with said charging oil undergoing heating whereby the heat of the vapors is utilized to supply at least a portion of the heat required to distill the charging oil, and supplying such condensed heavier fractions and said reflux condensate to the heating zone to constitute said relatively clean distillate.

2,001,160
PERCOLATOR CONSTRUCTION
John E. Smith, Belleville, Ill., assignor to Knapp-Monarch Company, Belleville, Ill., a corporation of Missouri
Application February 23, 1932, Serial No. 594,607
4 Claims. (Cl. 53—3)



1. In a percolator construction, a moulded container having an opening in the upper end thereof, a percolator cup therein having a peripheral bead at its upper end and a cover for the opening in the upper end of said container, said cover having a downwardly projecting flange fitted over said bead and having its lower edge contracted to a slightly smaller internal diameter than the external diameter of said bead whereby the cover is retained by said bead when said container is tipped to pouring position.

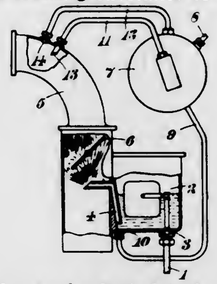
2,001,161
PERFORATING DEVICE
Harry D. Snyder, New York, and Emil Kern, Flushing, N. Y.
Application January 29, 1934, Serial No. 708,725
8 Claims. (Cl. 164—91)



1. A perforating device comprising a base, standards thereon each of sheet metal bent to provide a top and bottom with guide openings therein and projecting ears, punches supported in the guide openings and an operating lever pivotally connected to the punches and fulcrumed in slots formed in the ears, the slots being disposed with their axes in angular relation to a horizontal plane parallel to the base.

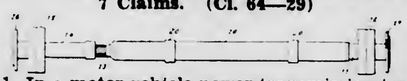
2,001,162
SYSTEM OF BUILDING CONSTRUCTION
Joseph B. Strauss, Chicago, Ill.
Application September 23, 1931, Serial No. 564,560
6 Claims. (Cl. 72—1)

6. A structure comprising a building section comprising a metal edge with one projecting flange forming a unitary member T-shaped in cross section, a unitary metallic mesh connected with said metal edge near its center and cementitious material embedding said mesh and limited by and flush with the face of the metal edge the outer face of said flanged metal edge being substantially parallel throughout its entire area with the cementitious material which engages the face of said metal edge.



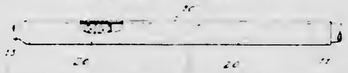
2,001,163
TRAIN-CONTROL APPARATUS
Frank J. Sprague, New York, N. Y., assignor to General Railway Signal Company, New York, N. Y., a corporation of New York
Original application December 31, 1914, Serial No. 879,939, now Patent No. 1,780,148, dated October 28, 1930. Divided and this application August 24, 1927, Serial No. 215,119. In Canada December 29, 1915
41 Claims. (Cl. 246—63)

21. In an automatic train control system a brake control device inactive when energized, a main energizing circuit and an auxiliary circuit for said device, manual means to close the auxiliary circuit and means to prevent the auxiliary circuit from being closed if the brake control device is in its active condition.



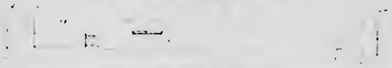
2,001,164
INDUCTION SYSTEM FOR INTERNAL COMBUSTION ENGINES
Andrew Swan and William Helmore, Hampshire, England
Application August 1, 1934, Serial No. 737,974
In Great Britain August 3, 1933
16 Claims. (Cl. 123—127)

1. A device for preventing detrimental ice formation in the induction system of an internal-combustion engine comprising means for supplying an anti-freezing substance to said induction



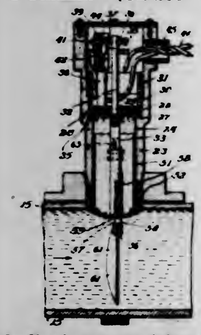
system and means adapted to be influenced by freezing conditions, whereby automatically to control the supply of anti-freezing substance.

2,001,165
PROPELLER SHAFT
Benjamin A. Swennes, Rockford, Ill., assignor, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application June 7, 1932, Serial No. 615,917
7 Claims. (Cl. 64—29)



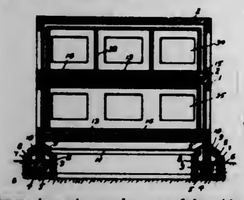
1. In a motor vehicle power transmission train, a hollow propeller shaft having suitable power transmitting connections at opposite ends, and means turning with the shaft as a rigid part thereof and having engagement with the walls of said shaft only at and in the vicinity of the points of maximum vibratory motion to dampen the vibration and render the shaft substantially non-resonant.

2,001,166
PROPELLER SHAFT
Benjamin A. Swennes, Rockford, Ill., assignor, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application November 27, 1933, Serial No. 699,855
8 Claims. (Cl. 64—29)



1. A hollow propeller shaft for a motor vehicle power transmission train adapted to have suitable power transmitting connections at opposite ends, and a plug of non-resonant material frictionally engaging the inside of the shaft to dampen vibration of the walls thereof.

2,001,167
PROPELLER SHAFT
Benjamin A. Swennes, Rockford, Ill., assignor, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application November 27, 1933, Serial No. 699,856
8 Claims. (Cl. 64—29)



1. In a motor vehicle power transmission train, a hollow propeller shaft having suitable power transmitting connections at opposite ends, and means of tubular form, so as to fit said shaft, engaging the walls thereof and having periodical vibrations during rotation out of phase with the vibrations of said walls whereby to buck the same and render the shaft substantially non-resonant.

2,001,168
FLOW INDICATOR
Charles A. Turner, Chicago, Ill., assignor to Electric Controller Corporation, Chicago, Ill., a corporation of Illinois
Application June 29, 1934, Serial No. 733,091
4 Claims. (Cl. 200—81)

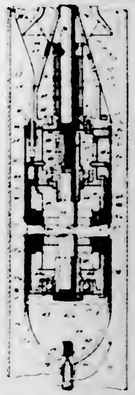
1. A flow indicator comprising a casing divided into a pressure chamber and a switch chamber by a diaphragm of thin flexible material facing the pressure chamber and a pressure plate centrally apertured and disposed back of and conforming with said diaphragm, a rod of greater diameter than the aperture in the said pressure plate extending from said diaphragm through said pressure chamber, a rod of less diameter than the aperture in said pressure plate secured through said diaphragm to said first mentioned rod, a pintle disposed diametrically of said pressure chamber, a flow indicating blade carried by said pintle, means for holding said blade in yielding co-operative relation with said rod of larger diameter, means for restoring the blade after movement to a normal position and switch opening and closing devices co-actively related with said rod of lesser diameter.

2,001,169
BUILDING STRUCTURE
Oscar R. Wallace, New York, N. Y.
Application November 1, 1934, Serial No. 750,915
9 Claims. (Cl. 72—77)

4. A building structure, in combination an outer frame formed with vertical posts and horizontal members, floors movably supported on said horizontal members, and walls mounted on said floors, each wall consisting of a plurality of thin translucent boards with air clearances therebetween.

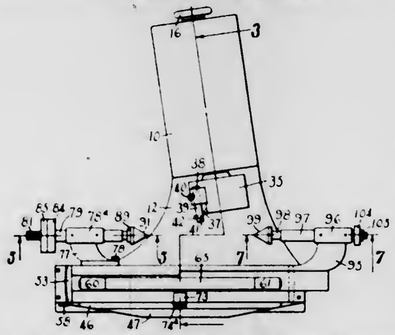
2,001,170
LOOSE LEAF BINDER METAL
Richard M. Watson, Detroit, Mich.
Application December 15, 1933, Serial No. 702,498
10 Claims. (Cl. 129—24)

1. A loose leaf binder metal comprising a base, ring members pivoted along one edge of the base, a bead along the opposite edge of the base having apertures for receiving the free ends of the ring members, the free ends of the ring members each having a notch therein, a locking rod insertable in the bead for fitting in the notches to hold the ring members closed, said locking rod having an end portion for substantially abutting one end of the base and having a notch therein



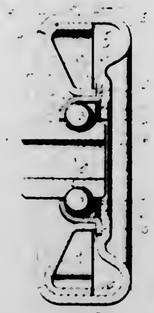
substantially at the opposite end of the base when the said end portion substantially abuts the base at which notch the rod is arranged to be bent to position one end thereof angularly as regards the bead to retain the locking rod positioned in the bead and held against any substantial lengthwise movement.

2,001,171
PROCESS OF PREPARING ACETIC ACID FROM ACETALDEHYDE
Karl Weibezahn and Felix Walter, Knapsack, near Cologne-on-the-Rhine, Germany, assignors to Aktiengesellschaft fur Stickstoffdunger, Knapsack, near Cologne-on-the-Rhine, Germany
No Drawing. Application September 30, 1933, Serial No. 691,691. In Germany October 11, 1932
7 Claims. (Cl. 260—116)



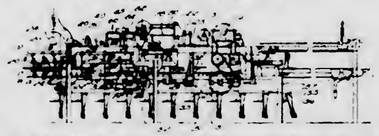
1. The process which comprises reacting with oxygen and ozone upon acetaldehyde in the presence of a solvent for acetic acid and acetaldehyde at a temperature above 0° C.

2,001,172
SUBMERSIBLE MOTOR DRIVEN PUMP
John A. Wintroath, Los Angeles, Calif., assignor to Wintroath Pumps, Ltd., Alhambra, Calif., a corporation of California
Application February 21, 1931, Serial No. 517,481
3 Claims. (Cl. 103—87)



1. In a submersible well pump, a pump discharge pipe, a substantially fluid tight casing supported on said pipe, a motor in said casing, said casing containing a lubricating oil in which the motor is submerged, means providing a displacement chamber into which lubricant is adapted to be displaced from said casing, and means for introducing well liquid to said displacement chamber at a pressure in excess of the static head of liquid standing in the well above said chamber.

2,001,173
REAMER GRINDER
Edwin R. Zeits, New Haven, and Stanley W. Dennison, Branford, Conn.
Application November 3, 1931, Serial No. 572,770
7 Claims. (Cl. 51—123)

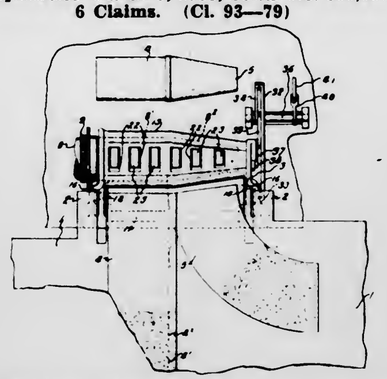


1. In a reamer grinder, a frame, a grinding wheel operatively supported by said frame, a carriage mounted to move generally transversely of the grinding wheel and to tilt about a horizontal axis, a sub-base mounted on said carriage to move relatively thereto in a horizontal plane, and work holders supported on said sub-base, and said work holders being mounted to center about a horizontal axis, and means for moving said work holders about said axis and holding them in adjusted position.

2,001,174
SKATE WHEEL
Herbert L. Zimmerman, Milwaukee, Wis., assignor to Globe-Union Mfg. Co., Milwaukee, Wis., a corporation of Wisconsin
Application August 10, 1933, Serial No. 684,491
7 Claims. (Cl. 208—181)

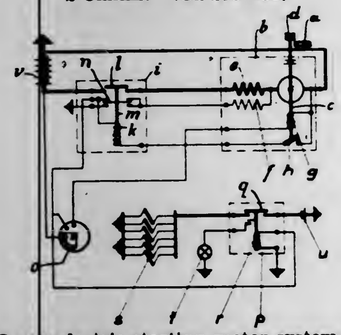
1. A wheel comprising a cupped member having a flange providing the tread of the wheel and a corrugated web providing the body of the wheel, said web having an annular depression on its inner surface providing a seat, a ball bearing retaining cup having an annular flange fitted in said seat, a complementary cupped member interfitted and interlocked with said first named member and having an inner flange bearing against said cup with its edge abutting the flange thereof to retain the cup in position.

2,001,175
PACKAGING MACHINE
Ross T. Adams, Richard S. Poole, and Morris Raymer, Battle Creek, Mich., assignors to Kellogg Company, Battle Creek, Mich., a corporation of Michigan
Application June 8, 1932, Serial No. 616,007
31 Claims. (Cl. 93—6)



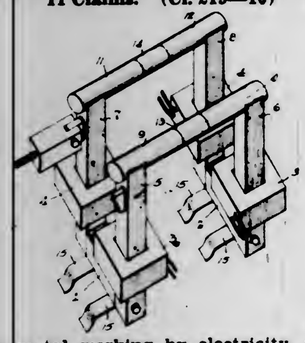
1. A bag sealing machine including in combination, means for carrying an open mouthed bag, means for applying adhesive to the inside edges of the mouth thereof at the same time, means for folding the mouth of the bag to form a pair of substantially parallel side walls, and means for pressing the said pair of side walls together, whereby to seal the mouth.

2,001,176
RUBBER COMPOSITION AND METHOD OF MAKING THE SAME
Frank H. Bergeim, Leonia, N. J., assignor to The Barrett Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application October 3, 1930, Serial No. 486,279
20 Claims. (Cl. 106—23)



1. A composition of matter comprising rubber and a coal tar distillate derived from low temperature tar, said distillates boiling under atmospheric pressure at temperatures above about 200° C.

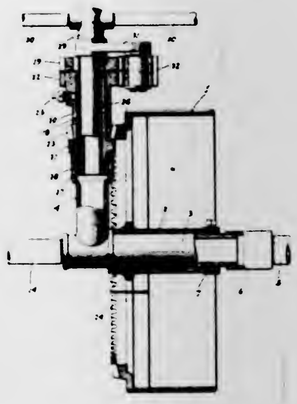
2,001,177
WINDING MECHANISM FOR PAPER BOTTLES
Andrew Bodor, Newark, N. J., assignor to Reinforced Paper Bottle Corporation, New York, N. Y., a corporation of Delaware
Application March 9, 1933, Serial No. 660,087
6 Claims. (Cl. 93—79)



1. The combination with a mandrel comprising a cylindrical straight portion and a frusto-conical portion, of a shell having its interior walls spaced from the mandrel a distance equal to the thickness of the blank and corresponding in shape to the shape of the straight and tapered portion of the mandrel and means for simultaneously winding a blank portion around each straight and tapered portion of the mandrel with their adjacent edges in lapped position to form a bottle body.

2,001,178
ELECTRIC STARTING MOTOR
Jakob Bohli, Solothurn, Switzerland
Application July 7, 1933, Serial No. 679,386
In Germany July 14, 1932
2 Claims. (Cl. 290—38)

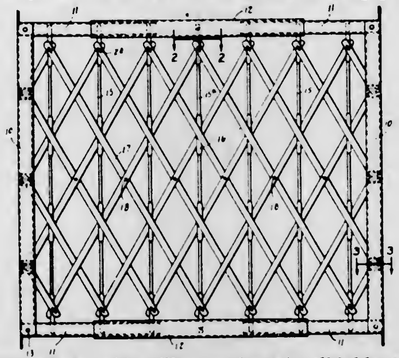
1. In an electric starting motor system for internal combustion engines, in combination a rotor, a field coil, a special field coil, a pinion, a pinion shaft, an overrunning clutch, said pinion coupled to the pinion shaft by means of said overrunning clutch, an engine flywheel, a ring of teeth mounted on the latter, an electro magnet for operating said pinion shaft, a switch operated by said pinion shaft in such a way that after full engagement of the pinion in the ring of teeth on the flywheel said switch is closed, a main current switch, a switch for the special field coil fixed to the latter, an electro magnet for operating the two latter switches, a battery for the starter, a three-position blade-type switch adapted to switch out all circuits in the nought position and to switch in the first switching position the special field coil into the circuit so that the rotor rotates opposite to the working direction of rotation and adapted to operate in the second switching position said first mentioned electro magnet which displaces the pinion into engagement and closes said first mentioned switch which renders operative the main and the special field coil switches in such a way that the main circuit is closed and the current in the special field coil is changed so that the effect of the latter field is added to the one of the main field coil.



2,001,179
ELECTRIC ARC WELDING
Bernard J. Brugge, Cleveland, Ohio, assignor to The Lincoln Electric Company, Cleveland, Ohio, a corporation of Ohio
Application February 2, 1933, Serial No. 654,834
11 Claims. (Cl. 219—10)

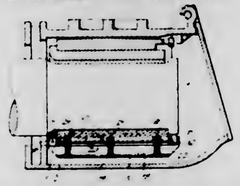
5. In metal working by electricity, the steps which consist in establishing an arc between the work and a suitable electrode, and at the same time directing the arc by means of magnetic fields, the lines of force in which are concentrated in areas respectively extending across and along the line being welded on different sides of the arc.

8. Apparatus for use in stabilizing an electric welding arc comprising a plurality of electro-magnets, all of the poles of said electro-magnets being arranged to extend toward the work and so positioned relatively to each other that a line drawn through successively arranged poles encompasses the area in which the arc is to be maintained, directed and stabilized.



2,001,180
TRAVELING SPRINKLER
William A. Buckner, Fresno, Calif.
Application December 26, 1933, Serial No. 703,874
4 Claims. (Cl. 299—50)

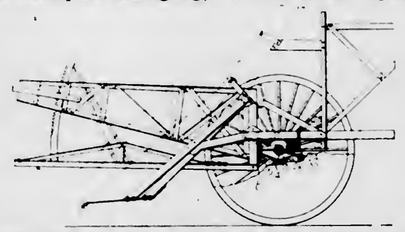
1. In a traveling sprinkler having a horizontal passage member, a turnable coupling connection for one end of said member and means to turn the member about said connection as an axis; a nozzle on the outer end of the member set to discharge water away from the same in a longitudinal direction and at an upward angle, and another nozzle mounted on said member for adjustment about a vertical axis disposed adjacent said first nozzle to discharge a stream in a substantially horizontal direction but inwardly of the area covered by the discharge from the first named nozzle.



2,001,181
ADJUSTABLE GRILLE
James P. Burcham, Indianapolis, Ind.
Application April 13, 1934, Serial No. 720,396
3 Claims. (Cl. 20—71)

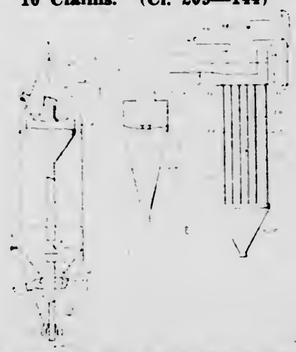
1. A grille comprising a rectangular frame having a plurality of frame sections telescoping one within the other, a plurality of rigid bars mounted in spaced parallel relation to each other with their free ends slidably mounted with respect to said frame sections, a plurality of interwoven grille members angularly disposed in relation to each other and said bars, each of said bars being slidably embraced between said grille members at their points of intersection, and a locking plate

mounted on said grille members to slidably embrace and retain said bars in relation thereto.



2,001,182
JOURNAL BOX LUBRICATOR
Thomas Cardwell, St. Louis, Mo.
Application September 11, 1933, Serial No. 688,881
5 Claims. (Cl. 308—88)

1. A journal box lubricator comprising a support, a cross member pivoted near one end of said support, a pair of spaced brackets attached to the opposite end of said support, two spaced parallel bars having their inner ends attached to said cross member and having their outer ends detachably engaging the inner ends of said brackets and supported thereby, a wick device mounted between said bars, an actuator for pressing said wick device upwardly, and a latch member pivoted to one of said brackets and engageable with and disengageable from the other for holding said wick device from outward longitudinal movement from between said bars.

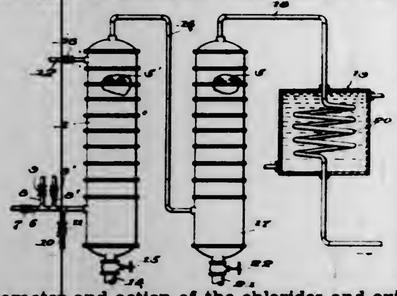


2,001,183
RESILIENT WHEEL SUPPORT FOR HARVESTERS
Wilbur J. Coultas, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application August 29, 1932, Serial No. 630,832
3 Claims. (Cl. 280—124)

1. In a wheeled vehicle having a frame comprising a longitudinally extending member and a transversely extending member, the combination therewith of a casting comprising a transversely disposed elongated sleeve, a pair of lugs extending forwardly from opposite ends of said sleeve, means pivotally connecting the ends of said lugs to said transversely extending member whereby said casting may swing relative to said frame about a transverse horizontal axis, a wheel supported stub axle mounted in said sleeve, a lug extending rearwardly from one end of said sleeve and disposed beneath said longitudinally extending member, a coiled spring disposed between said lug and said longitudinally extending member, a pair of perforated transversely spaced ears on said rearwardly extending lug, a U-bolt embracing said

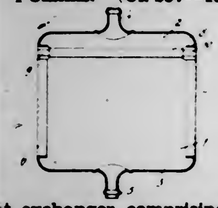
longitudinally extending member and having its ends projecting through the perforations in said ears, and means for adjustably securing the ends of said U-bolt to said ears.

2,001,184
CLASSIFIER
Hazlitt Alva Cuppy, San Francisco, Calif.
Application September 8, 1931, Serial No. 561,718
10 Claims. (Cl. 209—144)



9. In a classifier of the character described, a vertical conduit, means for passing an air current and material entrained therein through the conduit from below, means connected with the conduit causing the air current to discharge the material laterally whereby the discharged material is scattered, means for directing an air blast through the discharged material from below whereby lighter particles are carried upward and heavier particles are allowed to drop, an enclosure for the said particles at and above the discharge and means within said enclosure for again classifying the lighter particles, the said means having a second conduit within the enclosure above and alined with the first conduit and means for returning the heavier ones of the lighter particles through the second conduit to the original place of discharge.

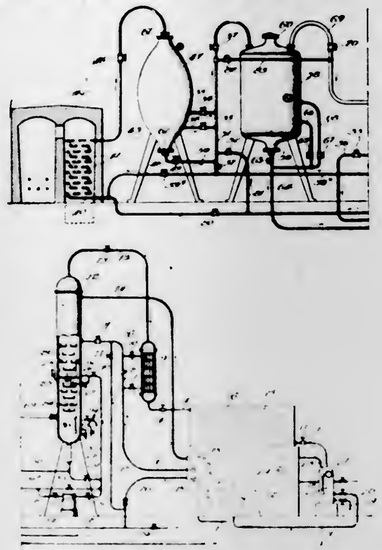
2,001,185
PROCESS OF ELIMINATING IMPURITIES FROM GASOLINE
Roland B. Day, Palos Verdes Estates, Calif., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of South Dakota
Application February 21, 1931, Serial No. 517,601
9 Claims. (Cl. 196—36)



1. A process for refining hydrocarbon vapors which comprises adding hydrogen chloride and steam to the vapors, and contacting the vapors in the presence of the added hydrogen chloride and steam with an aqueous solution of a water

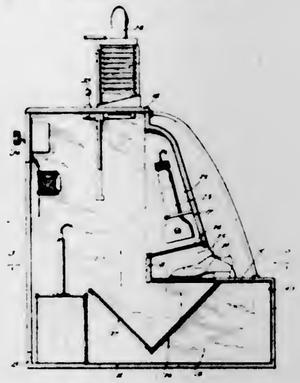
soluble chloride of a metal whose sulphide is substantially soluble in hydrochloric acid, said solution containing a reactive compound having the

character and action of the chlorides and oxides of the metals whose sulphides are substantially insoluble in hydrochloric acid.



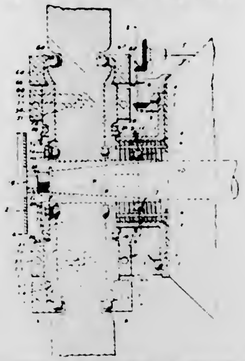
2,001,186
HEAT EXCHANGER
Claude Dornier, Friedrichshafen, Germany, assignor of one-half to Dornier-Metallbauten G. m. b. H., Friedrichshafen, Germany
Application May 31, 1933, Serial No. 673,653
In Germany July 23, 1932
4 Claims. (Cl. 257—139)

4. A heat exchanger comprising in combination, a light metal frame, water chamber and connecting pipe, a block of light metal radiator tubes, and a nickel layer arranged on the ends of said tubes exclusively, a layer of tin connecting the nickel layers on the ends of adjoining tubes.



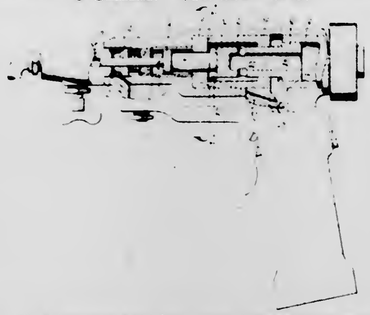
2,001,187
PROCESS FOR TREATING HYDROCARBONS
Carbon P. Dubbs, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of South Dakota
Continuation of application Serial No. 136,426, September 20, 1926. This application January 22, 1932, Serial No. 588,107
1 Claim. (Cl. 196—58)

A cracking process which comprises passing hydrocarbon oil in a restricted stream through a heating zone and heating the same therein to cracking temperature under pressure, discharging the heated oil into the upper portion of a vertically elongated reaction zone maintained under cracking conditions of temperature and pressure, passing both vapors and liquid oil downwardly through the reaction zone and removing the same as a mixture from the lower portion of the reaction zone, simultaneously advancing a continuous stream of charging oil toward the process under a mechanically applied pressure, dividing the stream of charging oil into separate portions and commingling one of these portions with the mixture of vapors and liquid oil withdrawn from the lower portion of the reaction zone, separating the thus commingled hydrocarbons into vapors and residue in a separating zone maintained under lower pressure than the reaction zone, fractionating the separated vapors in contact with another of said portions



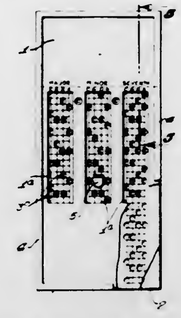
of the charging oil stream, supplying the resultant mixture of reflux condensate and charging oil to the heating zone, and finally condensing the fractionated vapors.

2,001,188
FOOT X-RAY MACHINE
Herman G. Fischer, Chicago, and Howard H. Osborn, Elmwood Park, Ill., assignors, by mesne assignments, to X-Ray Shoe Fitter, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application September 23, 1932, Serial No. 634,550
5 Claims. (Cl. 250—34)



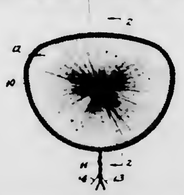
1. An X-ray apparatus for use in fitting shoes, which comprises a casing having a platform on which the individual may stand, an X-ray tube in said casing mounted above said platform, and a fluorescent screen mounted in said platform, and means for reflecting an image on said screen for observation.

2,001,189
CONTROLLABLE PITCH PROPELLER
Harold A. Fletcher, Chicago, Ill.
Application June 19, 1931, Serial No. 545,470
Renewed June 16, 1933
20 Claims. (Cl. 170—163)



1. A propeller comprising a drive shaft and a hub, said hub having radially extending portions; blades journalled therein; means surrounding said extended portion to prevent axial movement of said blade; collars adapted to move on said extending portions, and operating connections between said collars and said blades adapted to rotate said blades about an axis transverse to the axis of said shaft, said operating connections comprising pin cams carried by said blades cooperating with cam slots in said collars and in said extending portions.

2,001,190
NONSTICKING PNEUMATIC HAMMER GREASE GUN
Charles W. Ginter, Bryan, Ohio, assignor to The Aro Equipment Corporation, Bryan, Ohio, a corporation of Ohio
Application December 5, 1932, Serial No. 645,737
6 Claims. (Cl. 221—47.3)

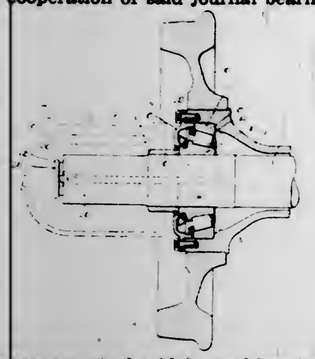


1. In a pneumatic hammer grease gun, a grease cylinder, a grease plunger reciprocable therein, a grease intake port in said cylinder, impact-receiving means connected with said grease plunger, a reciprocable pneumatic hammer element independently movable with respect to and engageable with said impact-receiving means to operate said grease plunger from position with said intake port open to discharge position with said intake port closed, said pneumatic hammer element having integral compressed air control valve ports arranged in position to cause reciprocation of said hammer element.

2,001,191
CHORD FINDER FOR TENOR BANJOS
Roy Lee Golden, Tucson, Ariz.
Application July 26, 1932, Serial No. 624,705
3 Claims. (Cl. 84—485)

1. In a chord finder for stringed musical instruments, a bottom member having a plurality of rows of note indicating indicia on its upper surface, a top member having a plurality of elongated openings therein and also having apertures interposed between said openings and a middle slide member interposed between said top and bottom members and having a plurality of rows of chord representing apertures therein, the rows in said bottom member middle member and the elongated openings in said top member being in alinement with each other and said middle member being slidable longitudinally relative to said top and bottom members.

2,001,192
PROCESS OF MAKING ORNAMENTAL THREAD OBJECTS
Henry González, New York, N. Y.
Application April 3, 1934, Serial No. 718,755
5 Claims. (Cl. 41—10)

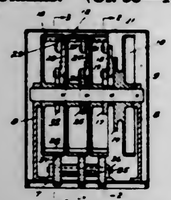


1. In an ornamental thread object, a frame of helical wire having twisted ends, and a thread having one end twisted around said twisted ends, and looped through the turns of said helical wire and having its other end twisted around said twisted ends.

2,001,193
WHEEL AND AXLE ASSEMBLY
William C. Hedgcock, Wilmette, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application July 27, 1931, Serial No. 553,336
23 Claims. (Cl. 308—180)

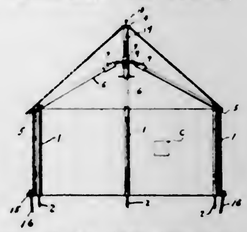
1. In a bearing assembly, the combination of an axle having a journal portion, a roller bearing assembly adjacent said portion, and a journal bearing disposed on said journal portion, said axle and journal bearing having limited relative movement in opposite directions, the movement thereof

being limited in one of said directions only through cooperation of said journal bearing and



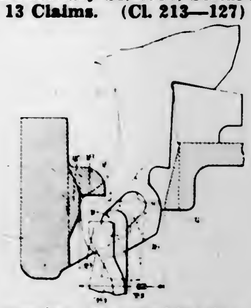
axle by engagement of said journal bearing with said roller bearing assembly.

2,001,194
PROCESS OF TREATING BRAKELINING AND IMPREGNATING COMPOUND FOR SAME
Otho T. Hedneficld, Glendale, Calif.
No Drawing. Application October 29, 1930, Serial No. 492,698. Renewed September 19, 1934
6 Claims. (Cl. 134—11)



1. A composition for fireproofing brake lining formed by mixing the following ingredients in the following proportions: 10 to 20 grams of aniline dye, 60 pounds ammonium sulphate, 10 pounds ammonium phosphate, 12 pounds boric acid crystals, 4 pounds gum acacia, 2 pounds cresley ore, 4 pounds barium hydroxide, 1 quart aqua ammonia, 2 pounds ammonium aluminum sulphate, 1½ pounds copper sodium alginate, 1 ounce benzaldehyde, 2 pounds bicarbonate of soda and 100 gallons distilled water as to produce a non-flammable and on the whole non-combustible compound and capable of use when melted for impregnating brake lining to make it fireproof.

2,001,195
CLOCK
Nathan George Herwitt and Morris Katcher, New York, N. Y., assignors to Design Engineers, Incorporated, New York, N. Y.
Application February 17, 1933, Serial No. 657,220
15 Claims. (Cl. 58—125)



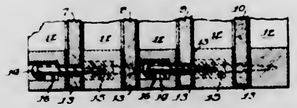
15. A clock comprising a casing, a row or drums rotatably mounted in the casing, said drums presenting time indicating numerals, a motor for driving a drum at one end of the row, means between adjacent drums operatively connecting each drum with its neighboring drum in the row, said means effecting a partial rotation of each succeeding drum to a predetermined amount of rotation of its predecessor in the row, beginning with the motor driven drum, a wheel, rotatably set against each drum except the motor driven one, the setting of each wheel providing substantial frictional resistance against its rotation to prevent overrun of a drum when given a partial rotation by its preceding drum, each wheel having rolling engagement with its corresponding drum and projecting through the casing, the projecting portions of said wheels serving as means for setting their corresponding drums by hand.

2,001,196
TENT
Samuel E Jost, Ogden, Utah
Application June 6, 1933, Serial No 674,511
2 Claims. (Cl. 135—4)

1. In a tent of the class described, the combination of a walled tent, poles carried in each corner thereof, having the top end carrying a loop and with a peg on the bottom; a ring carried in the apex of the roof; a central threaded rod having the top end extended through said ring; a threaded body to be raised or lowered by rotation of said rod; sockets pivotally secured to the outside of said body; removable struts severally carried in said sockets, each strut having a bar in the end thereof to extend out through an associated corner of the tent and through the loop in the top of a corner pole; and corner rings severally secured in the bottom corners of the sides of the tent through which pegs may be driven to secure the corners of the tent.

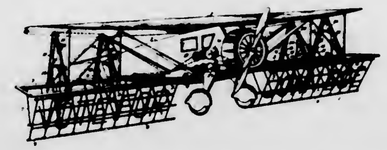
2,001,197
COUPLER
Edmund P. Kinne, Alliance, Ohio, assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application February 24, 1931, Serial No. 517,676
13 Claims. (Cl. 213—127)

7. In a coupler, the combination of a head having an opening for passage of the leg of a lock, a lock having a leg movable in said opening, a bottom lift member for lifting said lock from a locking position, said member having a shoulder extending in the direction of the length of said coupler, and an anti-creep lug extending into said opening and cooperating with said shoulder



to prevent said lock from creeping into a non-locking position, the front and rear walls of said opening cooperating with forward and rear surfaces on said lock leg to provide limited forward or rearward movement of said lock leg about a pivot above the engagement of the lock leg surfaces therewith and to permit substantially vertical movement of the lock in service, said lift member being movable relative to said leg whereby said shoulder clears said lug during locking and unlocking movements thereof, said front and rear walls being constructed and arranged to maintain said lock leg in a locking position whereby the greater portion of said anti-creep lug extending beyond the lock cooperating portion of one of said walls overhangs said shoulder to cooperate therewith for effecting a positive anti-creep and whereby a positive unlocking is effected by the positive disengagement of the anti-creep lug and shoulder at all times as the lock leg is raised.

2,001,198
SAFETY RAZOR
Charles S. Klegman, Detroit, Mich.
Application January 15, 1934, Serial No. 706,608
6 Claims. (Cl. 30—12)

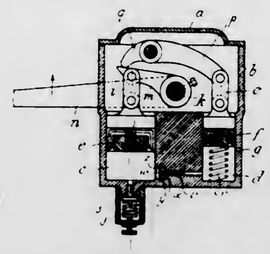


1. In a razor, a handle, a blade supporting head, a blade retainer plate, a universal connection between said handle and said head, and resilient manually releasable means in said handle and operative through said universal connection and engaging said plate to normally maintain the latter in a blade clamping position.

2,001,199
REFRIGERATOR
Herman W. Kleist, Chicago, Ill., assignor to Dole Refrigerating Machine Company, Chicago, Ill., a corporation of Illinois
Application October 12, 1931, Serial No. 568,221
4 Claims. (Cl. 20—56.5)

1. A refrigerator comprising an insulated casing, an observation section associated therewith comprising a plurality of glasses arranged side by side and separated from each other, supporting members for said glasses, means for compressing the edges of the glasses between said supporting members to form air tight joints, and means associated with said supporting members but separate therefrom for automatically adjusting them to compensate for expansion and contraction of the glasses due to variations in temperature.

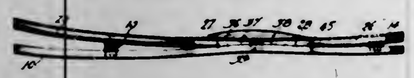
2,001,200
AEROPLANE SIGN
Bernard Knapp, Kansas City, Mo.
Application November 25, 1933, Serial No. 699,736
6 Claims. (Cl. 40—127)



1. A sign in combination with an aeroplane wing supported spaced beneath the wing a distance of at least half the length of the chord of said wing.

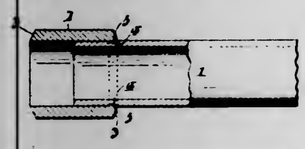
2,001,201
PYRIDINO COMPOUNDS AND THEIR PRODUCTION
Max Albert Kunz, Mannheim, and Gerd Kochendoerfer and Karl Koeberle, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application December 24, 1931, Serial No. 583,144. In Germany December 27, 1930
2 Claims. (Cl. 260—40)

1. The improvement in the manufacture of pyridino compounds, which comprises acting on an amine of a from one to three-ringed aromatic compound which in the case of a three-ringed isocyclic compound should not contain keto groups in para-position to each other, with glycerine in the presence of vanadium pentoxide and an aromatic nitro compound selected from the group consisting of nitrobenzene and nitrobenzene sulphonic acids, in a sulphuric acid of from 40 to 75 per cent strength at a temperature between about 110° and 160° C.



2,001,202
SHOCK ABSORBER
Ernst Ludwig Kunze, Chemnitz, Germany
Application March 1, 1933, Serial No. 659,033
In Germany March 4, 1932
3 Claims. (Cl. 188—88)

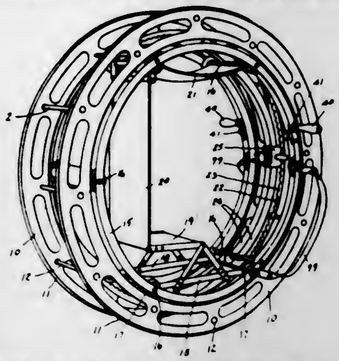
1. A pneumatic shock absorber with preliminary compression, especially for motor vehicles, comprising in combination a casing having two cylindrical chambers, a main piston in one of said chambers, an auxiliary piston in the other of said chambers, a two-armed rocker lever with one arm acting upon said auxiliary piston, an operating shaft between said chambers, and a one-armed lever keyed on said shaft and extend-



ing between said main piston and the other arm of said two-armed lever, said one-armed lever adapted to rock said two-armed lever to actuate said auxiliary piston.

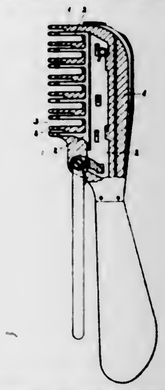
2,001,203
ARCH SUPPORT
Albert Kushinsky, Perth Amboy, N. J.
Application July 19, 1933, Serial No. 681,089
11 Claims. (Cl. 36—71)

7. In apparatus of the class described, the combination with a substantially rigid base member having a contour approximating the sole of the human foot, of a pair of lever elements approximating the form of the base member and disposed thereupon; said pair of lever elements arranged in adjoining end to end relation, a fulcrum for each element connecting with said base and adapted to cause an elevation of the inner adjoining portions of said elements when the outer extremities thereof are depressed, adjusting means for said fulcrums, and an arch supporting element pivoted upon both of said lever elements directly over the adjoining portions in a manner as to be actuated thereby.



2,001,204
PIPE JOINT AND METHOD OF MAKING THE SAME
James A. Long and Howard E. Fiant, Reading, Pa.
Application March 3, 1934, Serial No. 713,793
6 Claims. (Cl. 29—148.2)

1. A method of joining overlapping tubular metal members which consists in forming the outer member with a beveled edge at the end thereof inclined downwardly and outwardly, forming the inner member with an annular groove in its outer surface, assembling said members together in overlapping pressure-fitting engagement with the beveled edge of the outer member disposed opposite said annular groove in the inner member, and swaging the outer member at said beveled edge to produce an inwardly extending boss interlocking with said groove and forming a fluid-tight seal therewith.

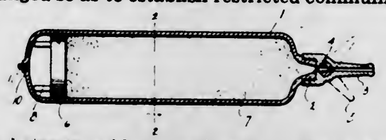


2,001,205
TOY LOOPING WHEEL
Otto Marten, Louisville, Ky., assignor of one-third to Emanuel Levi, and one-third to Howard W. Stodghill, both of Louisville, Ky.
Application August 30, 1933, Serial No. 687,405
13 Claims. (Cl. 208—1)

1. A device of the class described including a ground wheel structure, an inner wheel structure rotatably mounted on said ground wheel structure, an operator's seat carried by said inner wheel structure, a toothed ring carried by said ground wheel structure, and a ratchet device carried by said inner wheel structure, engaging said

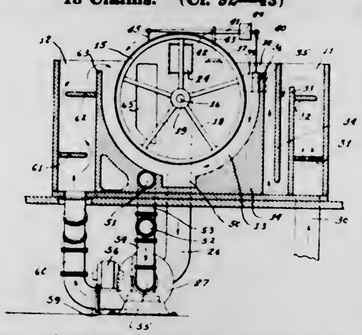
ring and operable to cause relative movement of the two structures for propulsion of the device.

2,001,206
HAIR THINNING DEVICE
Ernst Clemens Matthes, Leipzig, Germany
Application June 14, 1932, Serial No. 617,183
In Germany June 18, 1931
4 Claims. (Cl. 30—1)



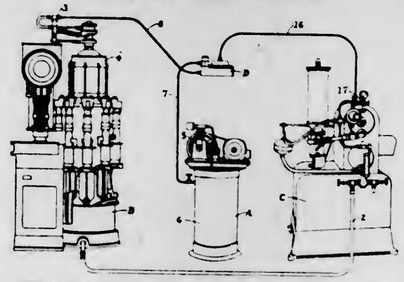
1. A hair thinning device consisting of a clipper and comprising a toothed stationary cutting plate, a toothed cutting plate adapted to move over said first plate and cooperate with the teeth on said stationary plate thru a limited movement, said teeth having recesses extending transversely of the contacting faces of the cutter teeth to produce longitudinally spaced cutting edges and clearance spaces along the teeth.

2,001,207
GAS GUN
Gerald P. McManamna and Kurt F. J. Kirsten, Seattle, Wash.
Application November 25, 1933, Serial No. 699,688
2 Claims. (Cl. 169—31)



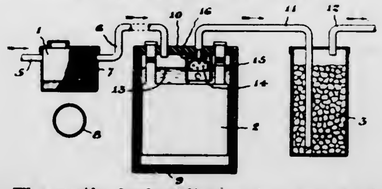
1. A device of the character described comprising a closed container having an outlet and a closure means therefor, a floating partition dividing the container into two separate compartments, respectively, for containing a concentrated supply of expandable pressure medium and a divided material and movable under pressure of

the expandable medium toward the outlet to advance material in the material compartment thereto; said partition being constructed and arranged so as to establish restricted communica-



tion between said compartments so that some of said medium will enter the material compartment to aid in expelling the material from the outlet.

2,001,208
CYLINDER PAPER MACHINE
Samuel V. Minskey, Leroy T. Foley, and Henry Leopold, Knox County, Tenn.
Application December 15, 1933, Serial No. 702,502
18 Claims. (Cl. 92—43)



2. In a cylinder type of paper machine, in combination, a vat for a pond of fibrous stock, a foraminous cylinder rotatably mounted therein, stock feed boxes on both sides of said vat, a main stock supply connected with one of said feed boxes, a pipe communicating with the bottom of said vat, and means for flowing stock through said pipe to the other of said feed boxes.

2,001,209
METHOD AND APPARATUS FOR BOTTLING
Evan L. Moberg, Latrobe, Pa., assignor to McKenna Brass & Manufacturing Co., Inc., Pittsburgh, Pa., a corporation of Pennsylvania
Application March 6, 1933, Serial No. 659,867
11 Claims. (Cl. 226—115)

1. The method of bottling, which comprises supplying air under pressure to a bottling machine, supplying carbonated water under pressure from a carbonating unit to the bottling machine, and varying the air supply directly in accordance with and proportionately to the variation of the pressure of gas in the carbonating unit.

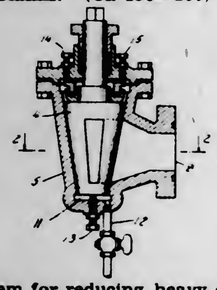
2,001,210
AUTOMATIC REGULATION OF WATER IN STORAGE BATTERIES
Sterne Morse, Richmond Heights, Ohio
Application February 11, 1931, Serial No. 515,020
4 Claims. (Cl. 136—162)

1. The method of adding water, principally in the form of its vapor, to the electrolyte in a storage battery cell comprising humidifying air outside of the cell and passing it within the cell into contact with the electrolyte therein.

2,001,211
PRODUCTION OF FATTY ACID ANHYDRIDES
Richard Müller, Heidelberg, and Erich Rabald, Mannheim, Germany, assignors to C. F. Boehringer & Saehne G. m. b. H., Mannheim-Waldhof, Germany
No Drawing. Application December 10, 1932, Serial No. 646,706. In Germany December 21, 1931
8 Claims. (Cl. 260—123)

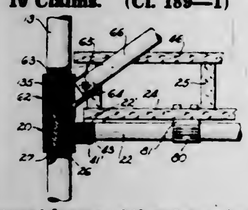
3. The method of producing fatty acid anhydrides comprising subjecting a compound of the group formed by ethylidene diacetate and the ethylidene compounds of homologous fatty acids in the vapor phase to a thermic treatment in the presence of a silicate which has been treated with an acid to convert it into a silica skeleton.

2,001,212
PRIMING COMPOSITION
Fredrich Olsen, Frederick R. Seavey, and Edward B. W. Kerone, Alton, Ill., assignors to Western Cartridge Company, East Alton, Ill., a corporation of Delaware
No Drawing. Application March 12, 1932, Serial No. 598,530
5 Claims. (Cl. 52—2)



1. A priming mixture comprising, a highly sensitive ingredient of the lead azide type in finely divided form, and a binder containing a deterrent substance of the class consisting of ester gum, cellulose acetate and Canada balsam.

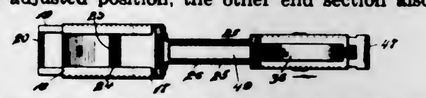
2,001,213
FINDING FOR A CLASP
Carl Pearson, Pawtucket, R. I., assignor to J. & L. Tool Company, Attleboro, Mass., a firm composed of Emil L. Johnson and Olof Lundsten
Application February 11, 1933, Serial No. 656,278
7 Claims. (Cl. 24—252)



1. A device of the character described comprising a pair of members, means for pivotally securing said members together, a resilient tongue folded from one member to extend between said member and engage the other member on the opposite side of the pivot from said fold and nearer the tongue carrying member than the pivot when in working position to tend to swing said members about said pivot in one direction.

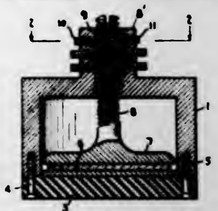
2,001,214
ART OF COKING HYDROCARBONS
Harry L. Pelser, Houston, Tex., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Application May 1, 1931, Serial No. 534,285
3 Claims. (Cl. 196—107)

3. In a system for reducing heavy oils to coke comprising a heater in which oil is heated to a cracking temperature upwards of 950° F., a coking receptacle adapted to permit the reduction of heavy oil to coke therein by the heat of the hot oil products discharged from said heater and a connection for discharging such hot oil products from said heater into said coking receptacle, a valve positioned in said connection comprising a frustro-conical rotatable plug seated in a body provided with ports communicating with said connection, and means for introducing relatively cool oil into said connection immediately in advance of said valve.



2,001,215
STRUCTURE
Frederick H. Ruppel, Pasadena, Calif.
Application December 10, 1932, Serial No. 646,579
10 Claims. (Cl. 189—1)

1. A structural frame of the character described, including: a main structural member consisting of a pipe; a secondary structural member; and a fitting for securing said secondary member to an intermediate portion of said pipe without necessity of dividing said pipe, comprising a split body having means for clamping it around said pipe, there being a plurality of substantially circumferential grooves disposed in parallel planes in the surface of said pipe engaged by complemental ribs on the inner face of said body.

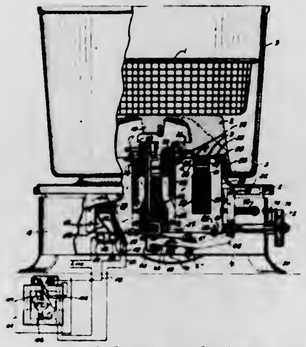


2,001,216
BRACELET BUCKLE
John Sand, Newark, N. J., assignor to Gemex Company, a corporation of New Jersey
Application August 24, 1933, Serial No. 686,558
7 Claims. (Cl. 24—71)

1. In a bracelet buckle, a plurality of sections connected together, one end section having two parts slidably related, an intermediate section, cooperating means between said intermediate section and one of said parts consisting of a pawl and ratchet respectively on said part, and said intermediate section for retaining the same in adjusted position, the other end section also

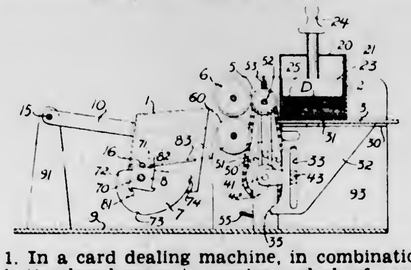
having two slidably related parts, and resilient means between said parts tending to move them into contracted position.

2,001,217
MEANS FOR COMPENSATING FOR TEMPERATURE CHANGES IN PIEZO-ELECTRIC CRYSTAL DEVICES
Theodore J. Scofield, Jackson, Mich., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application July 21, 1933, Serial No. 681,469
2 Claims. (Cl. 171—327)



2. In crystal controls, a crystal, a plate adjacent to one side of said crystal, a second plate adjacent to the other side of the crystal, a link supporting one plate and extending past the other plate, a second link connected to the first link and extending toward the second plate, said links having different coefficients of expansion and being of such length as to maintain the frequency characteristic of the crystal constant as the temperature changes, and means to manually alter the length of said links without substantially changing the relative distance between said plates.

2,001,218
SAFETY RAZOR
Hyman R. Segal, New York, N. Y.
Application October 3, 1931, Serial No. 566,620
2 Claims. (Cl. 30—12)

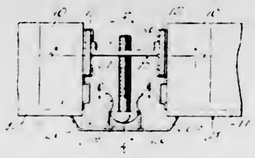


1. In a safety razor, the combination of a holder including a guard and a clamping plate, a blade comprising a substantially oblong rectangular body of thin flexible steel having cutting edges along the opposite longitudinal margins thereof, said body having a central opening therein and similar hook-shaped slots intersecting opposite sides of the opening and disposed between the same and the opposite end edges of the blade, said slots being arranged in reverse order with respect to the cutting edges so that each extends sinuously to like degrees on opposite sides of the longitudinal center line of the blade with the convex side of one slot facing one of the cutting edges of the blade and the concaved side of the same slot facing the opposite cutting edge of the blade and the corresponding sides of the other slot facing the said respective cutting edges in reverse order with respect to the sides of the first-named slot, one slot having its inner and outer ends generally inclined obliquely of the blade toward the corners at one end of the blade and the other slot having its inner and outer ends similarly inclined toward the corners at the opposite end of the blade, the guard being provided with a central opening and hook-shaped projections conforming in contour to and adapted to respectively aline with and engage the said opening and slots in the blade and the clamping plate being provided with complementary recesses to receive said projections, an attaching stem on the clamping plate to project through the openings in the guard and blade, and means carried by the holder to engage said stem to hold the clamping plate and guard in clamping relation to the blade.

2,001,219
HEATING DEVICE
Harold N. Shaw, Erie, Pa.
Application July 1, 1933, Serial No. 678,581
26 Claims. (Cl. 219—47)

1. An electrical heating device comprising a primary coil connectable with a source of electrical supply, a secondary circuit forming a heating element, and an inductor ring including laminated members arranged in circular formation, each laminated member being radially disposed to present continuous circular inner and outer concentric air gap faces.

2,001,220
CARD DEALING DEVICE
Richard C. Smith, Seattle, Wash.
Application January 6, 1932, Serial No. 585,042
13 Claims. (Cl. 273—149)

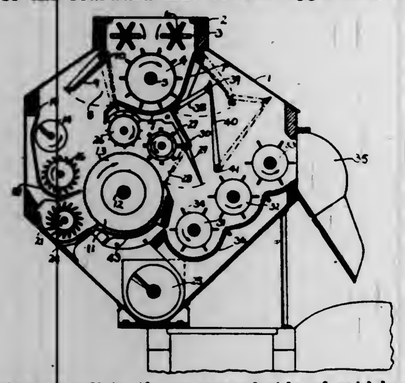


1. In a card dealing machine, in combination, a bottomless hopper to receive a deck of cards, a reciprocatory platform supporting cards in the hopper and spaced from the lower edge of the hopper at one side to leave a discharge slot therebetween, said platform being movable past said edge of the hopper to engage and project through the slot the lowermost card from the deck, means disposed above a card or cards thus projected to hold back all except the lowermost card, means to engage such projected lowermost card and to advance it, a plurality of receiving compartments, and means timed with the card projecting and advancing means to move the compartments in turn into position to receive successively advanced cards.

2,001,221
PRODUCTION OF 1,4-DIAMINO-2-ARYLOXY-ANTHRAQUINONE-3-SULPHONIC ACID
Berthold Stein, Mannheim, and Fritz Baumann, Leverkusen, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application March 30, 1933, Serial No. 663,654. In Germany April 5, 1932
4 Claims. (Cl. 260—59)

1. The process of producing 1,4-diamino-2-aryloxyanthraquinone-3-sulphonic acids which comprises heating an 1,4-diamino-2,3-dihalogenanthraquinone with a phenol and a salt of sulphurous acid in the presence of water and pyrolusite.

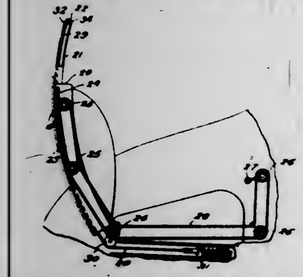
2,001,222
SUPPORTING APPARATUS
William L. Stensgaard, Chicago, Ill.
Application May 17, 1933, Serial No. 671,561
5 Claims. (Cl. 189—34)



5. In combination with two panels lying substantially in the same plane with their edges substantially facing each other and spaced apart; a pair of socket members each having a transversely arranged flat tapered socket; and a connecting unit including a vertical web-member and transversely arranged tapered tongues rigidly mounted on said web, said tongues adapted to be seated in said sockets.

2,001,223
COTTON MACHINE
John Arnold Streun, Sherman, Tex., assignor to Hardwicke-Etter Company, Sherman, Tex., a corporation
Application August 15, 1930, Serial No. 475,575
4 Claims. (Cl. 19—37)

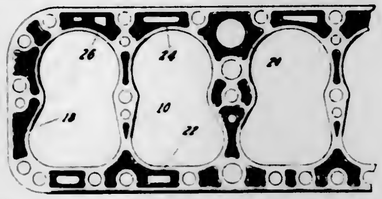
1. A cotton machine including a housing, a rotatable saw cylinder therein, means to feed the cotton to said cylinder, an agitator roll adjacent said cylinder, a conveyor roll above said agitator roll, arranged to move cotton along said cylinder from the middle toward the ends a toothed conveyor roll below said agitator roll to move the cotton longitudinally of said cylinder from the ends toward the middle, a knocker roll, a brush roll, and cleaning rolls to move the cotton away from said cylinder.



3. In a cotton machine, a housing, a feeder at the upper end thereof, a concave wall enclosing the lower side of said feeder, valve members in opposite sides of said wall, one of said valves being adapted to open and discharge the cotton forwardly, and the other to discharge it rear-

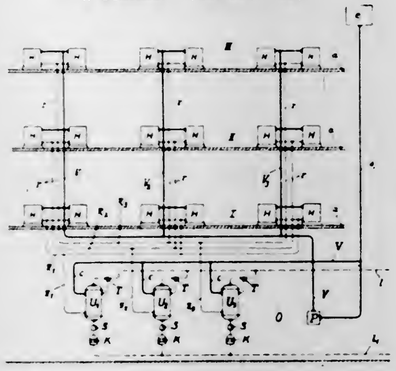
wardly of the machine, a hulling apparatus in the forward side of said housing, a valve adapted to close the rearward side of said apparatus, and

a cleaner roll in the rearward side of said housing adapted to receive the cotton passing either of said valves to move the cotton from the said housing.



2,001,224
AUTOMOBILE TOP
Joseph E. Tamés, Mixcoac, D. F., Mexico
Application May 25, 1934, Serial No. 727,553
In Mexico June 20, 1933
4 Claims. (Cl. 296—99)

1. In a rumble seat having a folding back serving when closed to cover the rumble seat, a seat protective covering including guide rails fixed in the folding back of the rumble seat, guide bars movable in said rails, and endless chain to which the guide bars are connected for moving said guide bars into and out of the rails, and a curtain movable in the space within the body of the automobile and over the guide bars, said curtain being removably connected with one of the guide bars to compel movement of the curtain in one direction in the movement of the guide bars, the curtain being independently movable with respect to the guide bars to permit the extension of the curtain beyond the guide bars for forming a protective top for the rumble seat.



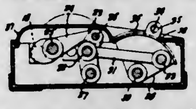
2,001,225
SKELETON METAL-BACKED GASKET
John H. Victor, Evanston, Ill., assignor to Victor Manufacturing & Gasket Company, Chicago, Ill., a corporation of Illinois
Application January 17, 1934, Serial No. 706,932
2 Claims. (Cl. 288—1)

1. A gasket comprising a sheet of asbestos having service openings therethrough, a metallic back secured to one side of said sheet, certain juxtaposed portions of the metal backing and asbestos

being cut away to provide openings in addition to the service openings.

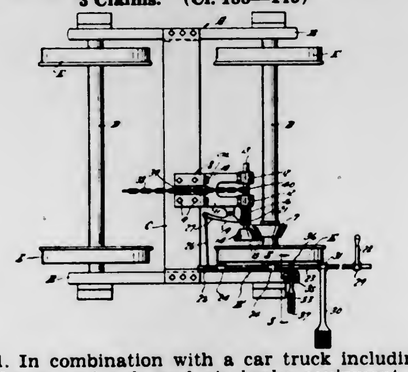
2,001,226
HOT WATER CENTRAL HEATING SYSTEM FOR A PLURALITY OF CONSUMER UNITS WITH INDIRECT MEASUREMENT OF THE HEAT CONSUMED
Heinrich Viewegh, Vienna, Austria
Application February 3, 1933, Serial No. 655,088
In Austria February 10, 1932
3 Claims. (Cl. 237—13)

1. A hot water heating system for a plurality of consumer units each consisting of one or more radiators, comprising in combination a hot water supply pipe system common to all the consumer units, a heat exchanger associated with each of the said consumer units and connected to the said supply pipe system, a separate return pipe from each consumer unit to the appropriate one of the said heat exchangers carrying water to be heated exclusively in the heat exchanger appropriate thereto, a condensate discharge pipe and a steam feed pipe connected to each of the said heat exchangers, and means interposed in each of the said condensate discharge pipes for the independent measurement of the entire heat consumption of each of the said consumer units.



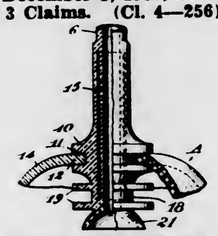
2,001,227
ROTARY KILN AND COOLER
Mikael Vogel-Jorgensen, Frederiksberg, near Copenhagen, Denmark, assignor to F. L. Smidth & Co., New York, N. Y., a corporation of New Jersey
Application January 31, 1935, Serial No. 4,229
In Great Britain February 3, 1934
1 Claim. (Cl. 222—7)

A rotary kiln or cooler for use in the manufacture of cement and the like and containing chains suspended within the interior to move



during the rotation of the kiln or cooler, which chains are composed of circular links.

2,001,228
DRIVING MECHANISM
Raymond A. Walter, New York, N. Y., Bertha Baer Walter, executrix of said Raymond A. Walter, deceased, assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application May 6, 1931, Serial No. 535,522
Renewed October 3, 1934
6 Claims. (Cl. 74—40)



1. A driving mechanism for a reciprocating conveyor, comprising a housing, a crank arm operating therein, and a pair of interconnected levers connected to the crank arm for imparting accelerated and retarded strokes of reciprocating motion, said levers being fulcrumed adjacent the bottom of the housing.

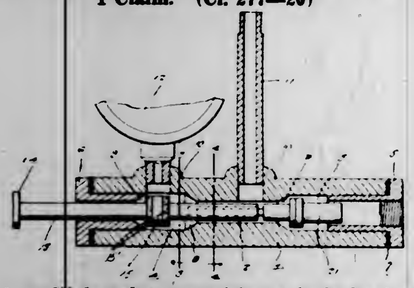
2,001,229
CAR BRAKE
Mack Ware, Houston, Tex., assignor of one-half to Joseph E. Robinson, Sr., Houston, Tex.
Application February 17, 1934, Serial No. 711,623
3 Claims. (Cl. 188—145)

1. In combination with a car truck including a frame and axle and air brake equipment, a tapered friction wheel on the axle, a bracket mounted on the frame, a brake shaft journaled and slidably mounted in the bracket adjacent the axle, a tapered friction wheel on the brake shaft adapted to be brought into engagement with the friction wheel on the axle by slidable adjustment of the brake shaft, and a chain secured at one end to the brake shaft and connected to the air brake equipment, an operating shaft journaled alongside the car truck, a shifter fork fulcrumed on the bracket and forked at one end to embrace the brake shaft, collars secured on the brake shaft at each side of the said fork, a coil spring on the brake shaft adapted to normally urge the friction wheels out of engagement and a cable connecting the operating shaft and shifter fork whereby the friction wheels may be engaged by rotation of the operating shaft a hand lever and foot pedal on the operating shaft, a ratchet wheel on the shaft, and a latch mounted on the truck frame and adapted to engage the said ratchet wheel to lock the operating shaft in adjusted position.

2,001,230
DRAIN PIPE CLEANING DEVICE
Herbert N. Wayne, Santa Monica, Calif.
Application December 8, 1933, Serial No. 701,468
3 Claims. (Cl. 4—256)

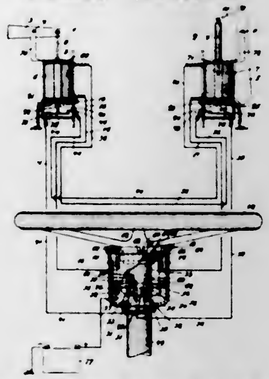
1. In a drain pipe flushing device, a tube, means for attaching one end of said tube to a faucet, a protuberance on the other end of said tube adapted to be inserted in the intake end of a drain pipe, and a resilient cup-shaped wall on the lower end of said protuberance of a diameter less than that of the drain pipe adapted to be spread to effect a sealing of the interior of the drain pipe.

2,001,231
APPARATUS FOR AUTOMATIC ELECTRIC ARC WELDING
Otto Weigner, Vienna, and Willibald Senft, Weiz, Styria, Austria, assignors to "Elin" Aktiengesellschaft für Elektrische Industrie, Vienna, Austria
Application February 28, 1934, Serial No. 713,386
In Germany March 4, 1933
8 Claims. (Cl. 219—8)



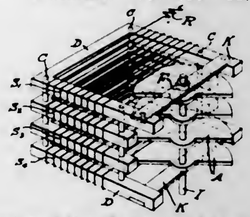
1. In electric welding apparatus using covered rod-shaped electrodes, means for the rigid and current-conducting interconnection of the said electrodes, spaced current-leading elements conductively and mechanically positively connected to the core of the said electrodes, electric conductors extending parallel to the said electrodes for a distance greater than the clearance between any consecutive two of the said elements, means for securing electrical contact between the said conductors and the said elements, and means for feeding forward the said elements.

2,001,232
KNIFE
John Allison Wilson, South Pasadena, Calif.
Application June 13, 1932, Serial No. 616,859
5 Claims. (Cl. 17—1)



2. In a slaughtering device, the combination of a stationary casing, an annular member at the lower end thereof, a cylinder slidably mounted therein and having oppositely disposed longitudinally extending slots at the upper end thereof, links pivoted within the slots, leaves connected to the links and adapted to be positioned within the slots, a tube within the cylinder attached to the annular member, a valve arranged within the upper end of the cylinder, a valve-seat formed on the upper end of the tube, means for moving the valve out of the valve-seat, said means including a piston slidably mounted within the casing and around the tube and having rods pivotally connected to the leaves, dogs connected to the lower ends of the rods and attached to the piston, said casing having lugs and recesses near the upper ends of the walls thereof to engage the dogs, and means whereby fluid pressure may be applied to the piston to cause movement thereof relative to the casing, whereby the cylinder may be moved and maintained in an outwardly exposed or inwardly confined position relative to the casing.

2,001,233
TIRE INFLATER
Fritz H. Anderberg, Centerville, S. Dak.
Application September 6, 1934, Serial No. 743,000
1 Claim. (Cl. 277—20)

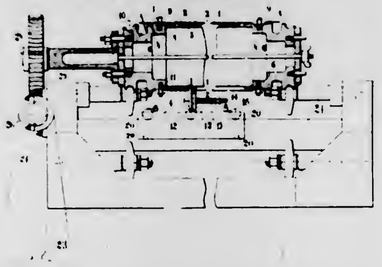


A multiple valve comprising a body having a central longitudinal bore therein and chambers in each end thereof communicating with said bore, valve seats formed in each end of said bore, a bushing extending into one of said chambers and having a valve seat formed in the inner end thereof, a rod slidable in the bushing and into the chamber and having a valve on the inner end thereof cooperable with the valve seat in the bore and the valve seat on the free end of the bushing, a tubular member secured to the inner end of said valve and extending into the longitudinal bore, a stem slidable in said tubular member and a valve on said stem cooperable with the other valve seat of the longitudinal bore.

2,001,234
SWITCH FOR DIRECTION INDICATORS
Sven Johan Eugen Asklund, Stockholm, Sweden
Application May 12, 1931, Serial No. 536,829
In Sweden May 16, 1930
5 Claims. (Cl. 200—59)

1. In a signalling system for motor vehicles having a steering column and a steering wheel rotatably mounted therein, a receptacle mounted on and surrounding the steering column adjacent to the steering wheel, a semi-annular, manually operable signalling switch member pivoted on the receptacle adjacent to the steering wheel and arranged coaxially thereof, a signal restoring device accommodated within said receptacle, an actuating member of unidirectional operation connected with said restoring device, and an abutment rigidly connected with said steering wheel and projecting inside said receptacle into the path of said actuating member.

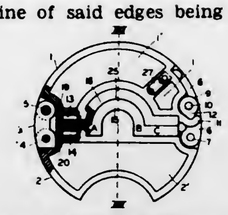
2,001,235
DEVICE FOR UNIFYING INDUCTANCES, CAPACITIES, AND RESISTANCES
John J. Aurynger, Takoma Park, Md.
Application December 11, 1933, Serial No. 701,935
6 Claims. (Cl. 250—16)



1. A device of the character described, comprising inductance, capacity and resistance, said inductance comprising coils of wire electrically connected together, having a plurality of cores situated adjacent to and in spaced parallel relation to each other; said capacity comprising metal plates forming a rotatably adjustable element, bilaterally disposed with respect to said inductance coils; said resistance being connected electrically to the said inductance and capacity, said inductance coils and said capacity metal plates being spaced apart.

2,001,236
HEDDLE BAR LOCK FOR LOOMS
George F. Bahan, Charlotte, N. C.
Application December 19, 1933, Serial No. 703,139
13 Claims. (Cl. 139—92)

1. A heddle bar lock including a screw, a housing carried by the screw and having a lip, a latch member slidable within the housing and held against upward displacement by the lip, said housing having an opening, and a spring carried in the housing and normally urging the latch member upwardly, said latch member being adapted to removably secure a heddle bar within the opening in the housing and being depressible against the tension of the spring for permitting release of the heddle bar from the opening.



2,001,237
MACHINE FOR THE MANUFACTURE OF PIPES
Léon Billé, Nogent-sur-Marne, France
Application April 14, 1931, Serial No. 530,125
In France May 8, 1930
1 Claim. (Cl. 242—11)

An apparatus for applying wrapped wire armor on the cylindrical surface of tubes, comprising means for supporting and rotating a tube, a track parallel to the axis of the tube, a carriage movably mounted on said track, means on said carriage for guiding a wire onto the rotating tube, a distance ruler formed of spring material fulcrumed on the carriage and having one end bearing on the tube and engaging the last winding of the wrapping on the tube so that rotation of the tube, due to the pitch of the winding in engagement with the ruler, will effect a movement of the carriage axially of the tube, and means associated with the other end of the distance ruler for adjusting the pressure of the ruler on the tube.

2,001,238
HAIR WAVING APPARATUS
Eli Ray Boals, Pasadena, Calif., assignor to Harry F. Thompson, Pasadena, Calif.
Application July 31, 1933, Serial No. 682,902
4 Claims. (Cl. 132—36.1)

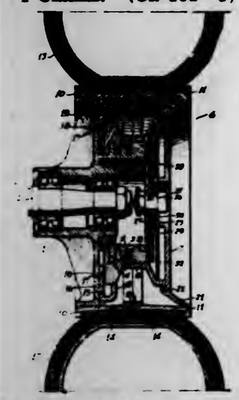
1. A clamp for the purpose described including hinged jaws having resilient meeting edges, the meeting line of said edges being arcuately deflected intermediate its length; and a latch adapted to compress said edges together.

2,001,239
SLACK ADJUSTER
Laurence R. Buckendale, Detroit, Mich., assignor to The Timken-Detroit Axle Company, Detroit, Mich., a corporation of Ohio
Application August 31, 1933, Serial No. 687,687
11 Claims. (Cl. 188—196)

1. A slack take-up mechanism comprising a shaft; operating means for the shaft including a member mounted freely on said shaft, a second member positively connected to said shaft, operating means for said first member, means for adjustably intercoupling said first and said second members, said adjustable means including an element screw-threadedly associated with one of said members and spring actuated means for locking said element against relative rotation with respect to one of said members.

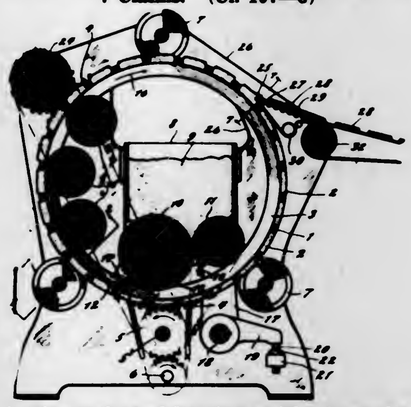
2,001,240
GARTER
Jeremiah C. Day, Lexington, Ky.
Application August 21, 1934, Serial No. 740,822
3 Claims. (Cl. 241—6)

1. In a garter of the character described, a pair of pads, each having contact areas with a leg of a person at portions thereof free of veins and arteries therein, a clip cooperating with the pads



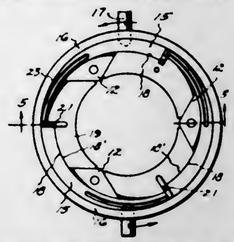
and out of contact with the leg at the rear thereof, means for adjustably connecting the pads at the fore of the leg, and means for attachment of a hose or sock with the pads.

2,001,241
FISHING FLOAT
Gerrit De Vries, Pipestone, Minn.
Application January 18, 1934, Serial No. 707,173
3 Claims. (Cl. 43—49)



1. A fishing float comprising a compressible body having recesses in the opposite ends thereof and provided with a longitudinal slot opening through one side thereof, bearing members seated in said recesses and provided with substantially circular seats, and a single continuous tube mounted for turning movement in said body and provided with enlarged circular heads fitted in said seats and disposed substantially flush with the outer faces of the bearing members, said tube and heads being provided with a longitudinal slot adapted to register with the slot in the body to permit the insertion of a fishing line.

2,001,242
DEMOUNTABLE WHEEL
Will K. Dodge, Upper Lake, Calif.
Application June 20, 1932, Serial No. 618,394
4 Claims. (Cl. 301—9)



1. A demountable wheel comprising a hub having segmental threads, a demountable wheel portion having segmental threads for meshing with the first named threads when rotated with respect thereto, ratchet teeth on the hub, a pawl carried by the demountable portion and engaging with the teeth when the portion is rotated for securing the wheel from return movement, a cam rockably carried by the portion for freeing the pawl from the ratchet teeth, and means for rocking the cam and rotating the demountable wheel portion, the initial moving of the means rocking the cam and freeing the pawl, and a further movement of the means in the same direction rotating the demountable wheel portion and freeing the threads for permitting the removal of the demountable wheel portion from the hub.

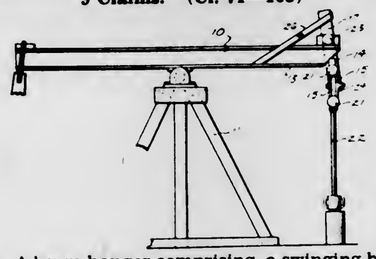
2,001,243
METHOD AND MECHANISM FOR FORMING ARTICLES OF PLASTIC MATERIAL
Irwin Elliott, Harmon, N. Y., assignor to Universal Oven Company, Incorporated, New York, N. Y., a corporation of New York
Application July 6, 1933, Serial No. 679,199
7 Claims. (Cl. 107—8)

1. The method of forming articles from plastic material which comprises forming said material into a sheet, forcing said sheet in successive layers into a plurality of orifices in a mold to form masses of material therein, forcing said masses through the orifices, and slicing off the portions of the material projecting from said orifices.

2,001,244
COUPLING
Floy H. Ezell, Sanger, Tex., assignor, by direct and mesne assignments, of one-third to Benjamin F. Gentle, Dallas, Tex., and one-third to Jeff D. Cornett, Sanger, Tex.
Application September 16, 1933, Serial No. 689,696
8 Claims. (Cl. 285—150)

1. A hose coupling comprising, a member having a hose connecting element, a plurality of internally screw-threaded gripping jaws mounted on the member and arranged to form a continuous gripping surface, rotatable means having eccentrics for displacing said jaws radially to open and close the same, keepers connecting the jaws with said means, and means for actuating said rotatable means.

2,001,245
MANUFACTURE OF CALCIUM SULPHATES
Orvon P. Gephart, Miamisburg, Ohio, assignor to Howard D. Meincke
No Drawing. Application March 5, 1931, Serial No. 520,481
7 Claims. (Cl. 134—18)



1. The method of improving the dispersibility of calcium sulphates which comprises incorporating therewith small proportions of a soluble aluminum compound and an alkaline lime compound.

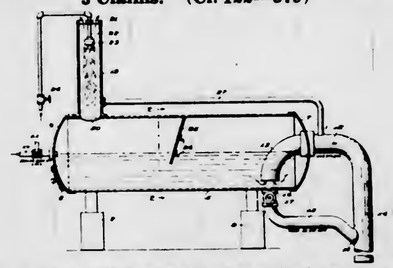
6. As a coating material, a dispersion of calcium sulphate modified by the presence of small proportions of a soluble alum compound and hydrated lime and containing a sizing agent.

2,001,246
MANUFACTURE OF PAPER
Orvon P. Gephart, Miamisburg, Ohio, assignor to Howard D. Meincke
No Drawing. Original application March 5, 1931, Serial No. 520,481. Divided and this application July 13, 1932, Serial No. 622,363
5 Claims. (Cl. 92—21)

1. In the preparation of paper, the method of incorporating calcium sulfates therein, which comprises incorporating in the paper pulp a dispersion of calcium sulfate containing small proportions of a soluble aluminum compound and an alkaline lime compound.

2,001,247
BEAM HANGER
William J. Gourley and Fred H. Barney, Fort Worth, Tex.
Application November 23, 1933, Serial No. 699,420
9 Claims. (Cl. 74—103)

1. A beam hanger comprising, a swinging beam, a pair of links pivoted together, rigid stop means carried by the beam and unattached to said links for engaging one of the links, stop means carried by one of the links for engaging the other link to arrest said links, and a rod clamp carried by one of the links.



2,001,248
DOUBLE SCREW CAP AND PROCESS OF FORMING SAME
Michael A. Greene, Wheeling, W. Va., assignor to Hazel-Atlas Glass Co., Wheeling, W. Va., a corporation of West Virginia
Application July 7, 1932, Serial No. 621,263
Renewed October 8, 1934
3 Claims. (Cl. 113—121)

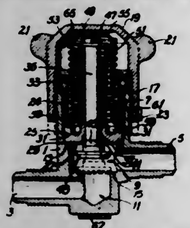
1. The process of forming a double screw cap which consists in forming a threaded inner shell with an outwardly flared portion terminating in a bead, forming a plain outer shell with an offset portion and a depending flange, nesting the inner and outer shells, curling the depending flange inwardly to form a bead encircling said first-mentioned bead, and collapsing said beads.

2. A screw closure for bottles and jars, including an inner shell having a top and a threaded skirt, an outwardly flared portion on the inner shell below the threads, a bead formed at the edge of the outwardly flared portion, a smooth outer shell within which the threaded shell is nested, the inner diameter of the outer shell being substantially the same as the outer diameter of the inner shell, an offset portion projecting laterally outward from the outer shell and turned inwardly and upwardly substantially completely about the bead on the inner shell, whereby the two shells are firmly united.

2,001,249
BLOW-OFF TANK FOR STEAM BOILERS
Price M. Greenlaw, Washington, D. C.
Application April 13, 1934, Serial No. 720,465
3 Claims. (Cl. 122—379)

1. A blow-off device for steam boilers comprising an elongated cylindrical casing having closed ends, a blow-off pipe from a steam boiler leading into one end, an overflow pipe leading into the casing from the opposite end and having a downturned end, a vent stack for the casing adapted to vent the steam vapors from the blow-off water discharged into the cylindrical casing, vapor condensing means arranged in said stack, vent means for the said overflow pipe exteriorly of the casing, a baffle plate in said casing arranged in the path of travel of the incoming blow-off products and drain means for the casing.

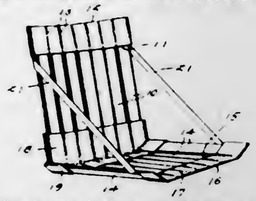
2,001,250
PROCESS OF PRODUCING CINEMATOGRAPHIC THREE- AND MULTI-COLOR PICTURES
Gerd Heymer, Dessau-Ziebigk, Germany, assignor to Agfa Ansco Corporation, Binghamton, N. Y., a corporation of New York
Application April 13, 1932, Serial No. 605,030
In Germany April 15, 1931
2 Claims. (Cl. 88—16.4)



1. A process for producing three-color pictures, which comprises dividing the rays of light emanating from the object into two bundles by means of a light-dividing system, arranging in the path of one bundle a color filter permeable to one of the three component colors and in the path of the other bundle a color filter permeable to the remaining of the three component colors, causing the bundle of rays transmitted by the filters to fall on two emulsion layers of suitable color-sensitivity arranged one behind the other in the form of a bi-pack, so that the two color components are recorded side by side in one emulsion layer and a third color component is re-

CARNEGIE LIBRARY OF ATLANTA

corded in the second layer in coincidence with one of the color components in the first named layer, developing the exposed emulsion layers, printing the negatives and dyeing or toning the two coincident positives each in the color complementary to the color component recorded on the corresponding negative, and projecting the film through the same optical system and filters as those used for recording the object, whereby a picture in color results.



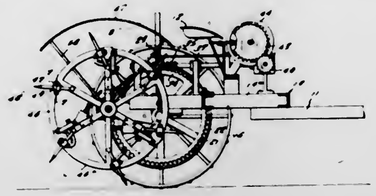
2,001,251
VALVE
Philip L. Irving, Port Huron, Mich., assignor to Mueller Brass Co., Port Huron, Mich., a corporation of Michigan
Application July 30, 1934, Serial No. 737,616
4 Claims. (Cl. 251—31)

2. A valve comprising a hollow body, a valve seat in said body, inlet and outlet means disposed on opposite sides of said valve seat, said body being open at one end, an element threaded into the open end of said body and having a bushing, a valve stem slidable in said bushing, said valve stem carrying at one end a valve closure element adapted to seat upon said valve seat, spring means tending to maintain said closure element off said valve seat, a collapsible bellows element surrounding said valve stem, spring means, and bushing, said bellows element being closed at one end and outwardly flared at the other end, a plug threaded into the open end of said body and clamping the flared end of the bellows element between itself and said first-named element, the closed end of the bellows abutting the end of the valve stem, and a cap threaded to said body, said cap being adapted interiorly to engage the closed end of said bellows, whereby threading of said cap down said body moves said valve stem against the reaction of said spring means to seat said valve closure element on said valve seat, and whereby threading of said cap up said body permits said spring means to move said valve stem to unseat said valve closure element from said valve seat, said first-named element having a counterbored portion providing a back-seating valve seat, and said valve closure element having a back-seating portion thereon adapted to cooperate with said back-seating valve seat under the influence of said spring means.

2,001,252
FOLDABLE CHAIR
Clarence Elmo Johnson, Quincy, Ill.
Refile of application Serial No. 546,863, June 25, 1931. This application January 19, 1935, Serial No. 2,615
3 Claims. (Cl. 155—133)

3. A chair of the character described having a seat and a back, each formed of a plurality of parallel slats, means flexibly connecting adjoining ends of the slats of the back to each other, and flexibly connecting adjoining ends of the slats of the seat to each other and flexibly connecting the slats of the seat to the slats of the back, straps attached to the lateral slats of the

seat and the lateral slats of the back, and members of flexible material formed with pockets receiving respectively the upper ends of the back slats and the forward ends of the seat slats.



2,001,253
LOAD HANDLING APPARATUS
Henry O. Kittleson, Milan, Minn.
Application September 21, 1933, Serial No. 690,432
7 Claims. (Cl. 214—65)

1. A load handling apparatus comprising in combination, a floor having load sustaining and traction surfaces formed in a common plane and including a plurality of parallel grooves forming continuous channels extending to a depth below the plane of the load sustaining and traction surfaces, and a truck having wheels whose treads are wider than the grooves forming the channels and adapted for tractive engagement in any direction with the load sustaining and traction surfaces of the floor and having load pick-up members of a width adapted to be moved into any selected channels by tilting the truck on the axle wheels to pick up a load from any location on the load sustaining and traction surfaces.

2,001,254
HARROW
Eugene L. Lancaster, Haskell, Tex., assignor of one-fourth to R. C. Lowe, Haskell, Tex.
Application August 15, 1934, Serial No. 739,988
1 Claim. (Cl. 97—216)

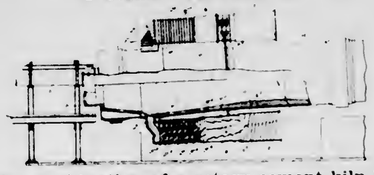
A toothed cylinder for harrows comprising a shaft, spiders mounted on said shaft, a circular series of rods rotatably supported by said spiders, a series of relatively spaced harrow fingers mounted on each rod to rotate therewith, and yieldable devices connected with the rods to normally urge the rods to rotate in one direction, said rods being rotatable in a reverse direction upon impact of a harrow finger with an obstruction, each of said devices including a member secured to a rod for rotation therewith and provided with an arcuate slot, a bracket member fixed relative to the rod, a plate pivoted to the bracket member, a link pivoted to the plate, a bolt carried by said link and operating in said slot, and a

spring device engaged with the bracket and said plate yieldably retaining the plate in a predetermined position.

2,001,255
CONCENTRATION OF HORMONES IN SECRETIONS OF THE HUMAN OR ANIMAL BODY
Hedwig Langecker, Prague, Czechoslovakia, assignor to Schering-Kahlbaum A. G., Berlin, Germany
No Drawing. Application October 21, 1931, Serial No. 570,261. In Germany October 27, 1930
9 Claims. (Cl. 167—74)

1. The method of concentrating sexual hormones in urine containing the same which comprises substantially saturating the urine with a highly soluble sulfate capable of producing a salting out effect, allowing the mixture to stand until separated into two layers and recovering the resulting supernatant layer of restricted volume containing substantially all the hormone in concentrated form.

2,001,256
METHOD AND APPARATUS FOR OBTAINING STEREOSCOPIC EFFECTS
Emile Pierre Louis Le Barbier, Nice, France
Application May 1, 1931, Serial No. 534,179. Renewed February 26, 1935. In Belgium May 6, 1930
3 Claims. (Cl. 88—16.6)

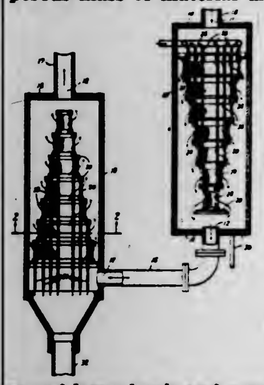


2. The method of producing monocular images in relief comprising the steps of providing an objective and a light sensitive material varying the effective aperture of said objective during the period that light is passing therethrough onto a light sensitive material, and projecting a beam of light through the image so obtained while varying the effective aperture of the projecting light beam during projection at an inverse rate to that employed during exposure of the light sensitive material.

2,001,257
RESILIENT CONNECTION
Charles Lecler, Levallois-Perret, France, assignor to Maurice Houdaille, Levallois-Perret, Seine, France
Application March 19, 1931, Serial No. 523,890
In France March 21, 1930
1 Claim. (Cl. 287—85)

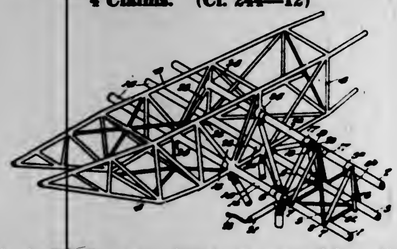
In a resilient torsion joint having two cylindrical members one of which is hollow and surrounds the other, means for resiliently resisting relative rotation between the two members comprising a single rubber strip wound upon itself so that the adjacent convolutions are in intimate contact with each other, and said strip being arranged between said members in such close contact with the opposed surfaces thereof that the adherence between the rubber strip and both cylindrical members and between the convolutions of said strip increases in proportion to the increase in relative angular displacement of said cylindrical members in either direction whereby relative sliding movement between said members and said strip is prevented.

2,001,258
ROTARY KILN AND COOLER
Povl T. Lindhard, Rumson, N. J., assignor to F. L. Smidth & Co., New York, N. Y., a corporation of New Jersey
Application December 15, 1932, Serial No. 647,340
In Great Britain September 13, 1932
1 Claim. (Cl. 222—7)



The combination of a rotary cement kiln having a downward pitch toward the discharge end and having its lower portion below the clinkering zone gradually enlarged in diameter interiorly, whereby the movement of the clinker is accelerated and the clinker is partially cooled, and provided beyond the enlarged portion with delivery chutes, and cooler tubes into which the clinker is delivered from the kiln through the delivery chutes, each cooler tube consisting of a succession of cylindrical sections of successively larger diameters stepped abruptly and open at the larger and upper end for the admission of cooling air and the discharge of the clinker and each cooler tube being axially parallel with the kiln, whereby the movement of the clinker through each cooler tube is delayed progressively and contact with the cooling air is extended.

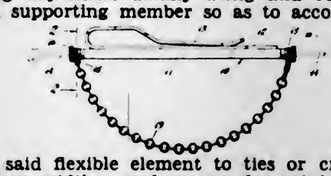
2,001,259
METHOD OF AND APPARATUS FOR CONDITIONING GAS OR VAPOR
Charles E. Lucke, New York, N. Y., assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey
Application December 2, 1933, Serial No. 700,673
9 Claims. (Cl. 183—9)



4. Gas conditioning apparatus comprising a casing having an inlet for gas to be conditioned

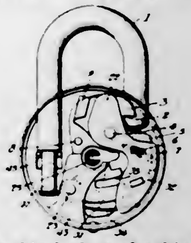
and an outlet for conditioned gas, ring members progressively decreasing in effective flow area towards said outlet, each of said ring members including a porous mass of material disposed be-

tween upper and lower levels and permitting the passage of gas therethrough in intimate contact with the surfaces thereof, and means for draining accretions of liquid at the lower level of each ring member.



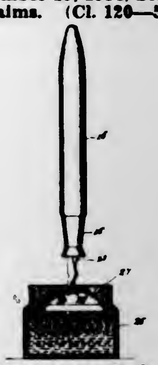
2,001,260
CONSTRUCTION AND ARRANGEMENT OF AEROPLANE WINGS
James Martin, Higher Denham, England
Application July 15, 1933, Serial No. 680,541
In Great Britain July 20, 1932
4 Claims. (Cl. 244—12)

1. A wing spar structure comprising three centre stub section tubular metal members secured across the frame of the fuselage parallel with each other, seating accommodation in the space between the said tubular members, a triangular section wing spar connected to each end of said stub section, tubular struts secured in sets of three across the said spar members, flattened ends to said struts, tubular lining members fitted at intervals inside the tubular spar members, boss like enlargements on said lining members, studs threaded into said enlargements and passing through said flattened ends of the said struts and nuts threaded on to said studs securing said struts to the tubular members.



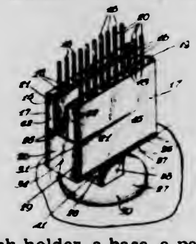
2,001,261
ADJUSTABLE CRAVAT HOLDER
Ben B. Manaster, Chicago, Ill.
Application February 4, 1935, Serial No. 4,823
11 Claims. (Cl. 24—49)

1. A cravat holder, comprising: a supporting member; a member rotatably mounted upon said supporting member at each end of the latter; a flexible element adapted to overlie a tie or cravat on the front or outer side of the same and having end portions suspended from said second-named members; said second-named members being adjustable axially along and relative to said supporting member so as to accommodate



the said flexible element to ties or cravats of various widths; and means for retaining said second-named members and said flexible element in a preselected adjusted position relative to said supporting member.

2,001,262
LOCK
Edwin W. North, Rockford, Ill., assignor to National Lock Co., Rockford, Ill., a corporation of Delaware
Application January 23, 1933, Serial No. 653,032
27 Claims. (Cl. 70—113)

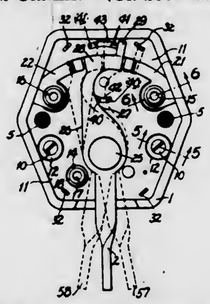


13. In a shackle lock, a shackle-locking mechanism including a pivoted locking dog engageable with the shackle, disk tumblers cooperable with said dog to lock the same in shackle-engaging position and adapted to be adjusted to release the dog for retraction, and key-operable means for shifting the pivot of the dog while in engagement with the shackle sufficiently to move the dog clear of said tumblers and thereby release it for retraction.

2,001,263
FOUNTAIN PEN AND FILLER
George Howard Osterhout, United States Marine Corps, Parris Island, S. C.
Application December 19, 1934, Serial No. 758,297
3 Claims. (Cl. 120—57)

3. In combination, a receptacle for ink having a small opening therein across which a film of ink forms when the receptacle is inverted to prevent the fluid ink body from flowing freely out of the receptacle, and a fountain pen having a barrel for containing ink, and a feed device connected with the barrel and having the usual feed groove connecting with the interior of the barrel and lying beyond the feed device, a nib covering the feed groove and having a split portion communicating with the groove, said nib adapted to be freely inserted in the small opening of the receptacle when the receptacle is inverted and the pen in a substantially upright position with the nib uppermost whereby to cause ink from the receptacle to flow down, by gravity and capillary attraction through the split portion of the nib, and the feed groove in the feed device, into the barrel, said feed device also having an air breathing passage therein separate from the feed groove, and means for opening and closing said air breathing passage.

2,001,264
MATCH HOLDER
Rodney S. Pullen, Akron, Ohio, assignor to Pullenlite Company, Philadelphia, Pa., a corporation of Pennsylvania
Application July 13, 1933, Serial No. 680,249
11 Claims. (Cl. 206—31)

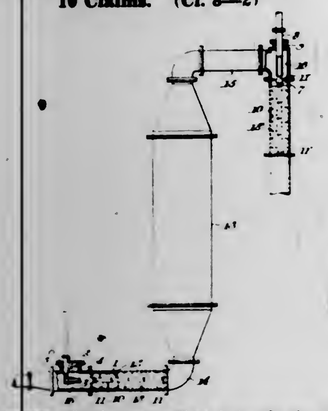


1. In a match holder, a base, a pair of laterally spaced generally parallel tongues secured to the base at opposite sides thereof and each adapted to enter between the folds of a packet of matches which light on withdrawal, a plate integral with and at substantially right angles to the base, said plate extending below the tongues, generally parallel to the lower edge of the tongues and spaced from the tongues to hold the bottoms of match packets and extensions, one from either side of the plate, parallel to the tongues and spaced from the tongues to follow the edges of the packets.

2,001,265
VEHICLE JACK
Roy H. Reed, Oklahoma City, Okla., assignor of one-half to Loyal J. Miller, Oklahoma City, Oklahoma
Application September 15, 1933, Serial No. 689,575
13 Claims. (Cl. 254—86)

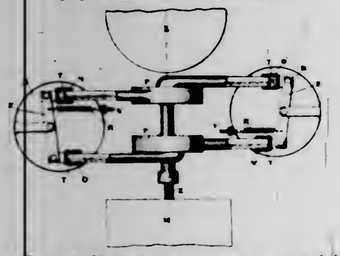
1. In a vehicle including a frame, an axle, and wheels carried by the axle, a lifting jack mechanism including: a leg having one end pivotally supported by said axle at one side of the axle whereby it may be swung downwardly into contact with the ground for lifting the adjacent wheel, and whereby the axle will act as a stop for retaining the leg in its lifting position, and spring means carried by the axle for retrieving and normally holding the leg clear of the ground.

2,001,266
TIME CONTROLLED SWITCH
Marcus H. Rhodes, Hartford, Conn., assignor to M. H. Rhodes, Inc., Hartford, Conn., a corporation of Delaware
Application January 26, 1933, Serial No. 653,561
2 Claims. (Cl. 200—35)



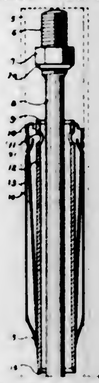
1. In a time-controlled switch, timing means, including a main shaft, adapted to be wound by rotation of said main shaft in one direction, and to unwind in a time-controlled manner rotating said main shaft in the opposite direction, manual control means having a neutral position and being rotatable on an axis parallel to that of the main shaft, in both directions from said neutral position, to establish different circuit conditions, means rotatable with said main shaft, said last-named means having two points of engagement with said control means when said control means is in neutral position, said points of engagement being spaced on opposite sides of said control means and on opposite sides of the center of rotation of said main shaft, and the center of rotation of said control means being outside the line connecting said points of engagement.

2,001,267
RUBBER BAND GUN
Albert S. Ross, Ada, Okla.
Application February 24, 1933, Serial No. 658,408
10 Claims. (Cl. 124—14)



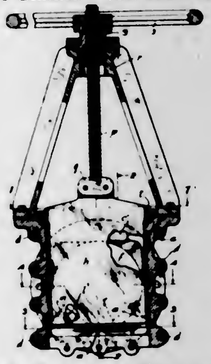
1. A rubber band gun, comprising a stock having a breech, an arm extending forwardly from said breech, an elongated member rotatably supported at its ends between the breech and the forward end of said arm, coacting elements at the ends of said elongated member for holding rubber bands in stretched condition and disposed longitudinally of the member, the elements adjacent the breech being adapted to be shifted for the release of the bands connected therewith, shiftable means normally holding said elements against movement by the tensioned bands and trigger actuated means normally restraining said means from movement by the band connected therewith, and releasing the latter when and as the elements are brought to a predetermined position by the rotation of the band carrying member.

2,001,268
PULP TREATING PROCESS
John D. Rue, Niagara Falls, N. Y., assignor to Hooker Electrochemical Company, New York, N. Y., a corporation of New York
Application October 18, 1933, Serial No. 694,171
In Canada September 21, 1932
10 Claims. (Cl. 8—2)



9. Process which comprises introducing into a water suspension of pulp chlorine to an amount 25 to 100 per cent in excess of that required for chlorination of the non-cellulosic constituents of said pulp, promptly and thoroughly mixing the chlorine with the pulp, reacting the chlorine with the pulp to a point substantially short of complete exhaustion of the chlorine as such and thereupon introducing an alkali into the reaction mixture in amount sufficient to neutralize the mixture and combine with the unconsumed chlorine, thoroughly mixing the alkali with the pulp, reacting the resulting hypochlorite with the pulp and washing the pulp.

2,001,269
HYDRAULIC COMPRESSOR
Serge Raymond Seillière, Paris, France
Application December 24, 1931, Serial No. 583,042. Renewed October 12, 1934. In France December 27, 1930
9 Claims. (Cl. 230—85)

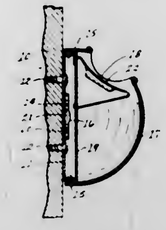


1. An hydraulic gas compressor comprising two compression chambers, liquid inlet and outlet means to each of said chambers, liquid conduits connecting the inlet of each chamber with the outlet of the other, pumping means in said liquid conduits, operating to convey liquid through said conduits back and forth between said chambers and means controlling said liquid inlet and outlet means, to reverse the direction of flow of liquid between the chambers when the pressure in the chamber undergoing compression reaches a predetermined value.

2,001,270
COMBINED ROD GUIDE, ROD CHECK, AND PARAFFIN SWAB
George E. Slaugenhop, Vernon, Tex.
Application August 27, 1934, Serial No. 741,711
7 Claims. (Cl. 166—18)

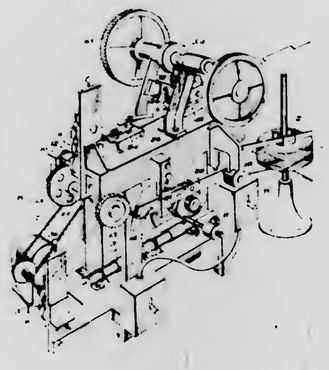
1. A pump rod, upper and lower valve stops thereon, a tubular guide mounted loosely on the rod between the stops and closable thereby, a swab on the guide, and friction holding means carried by the guide and engageable with the well tube to retain the guide and swab in desired position.

2,001,271
GATE VALVE
Walter G. E. Smith, Portland, Oreg.
Application December 3, 1930, Serial No. 499,709
6 Claims. (Cl. 251—55)



1. In a gate valve, a housing provided with inlet and outlet ports, a gate slidable between said ports in grooves formed in the side walls of said housing, the said side walls of said inlet side being provided at the bottom with cavities connecting with said grooves, in which to receive the material scraped off by the gate while being closed.

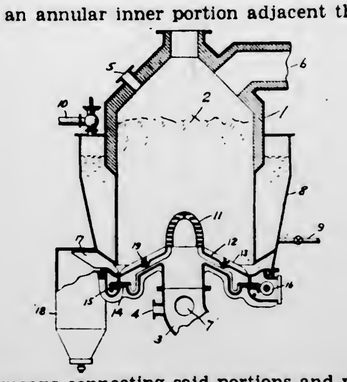
2,001,272
RECEPTACLE
John Visser, Grand Rapids, Mich., assignor to Grand Rapids Metalcraft Corporation, Grand Rapids, Mich., a corporation of Michigan
Application July 13, 1934, Serial No. 734,938
2 Claims. (Cl. 206—19.5)



1. In a device of the class described, a wall plate adapted to be fixed to a wall surface and

having a circular marginal edge provided with a pair of oppositely disposed raised portions and with a pair of oppositely disposed forwardly flanged portions, and a container having a back plate provided with a pair of projecting oppositely disposed and inwardly flanged tongues

adapted to engage the raised portions of the wall plate during the juxtaposition rotation of the container back plate upon the wall plate, said back plate contacting the forwardly flanged portions of the wall plate for spacing it from the surface to which the wall plate may be fixed.



2,001,273
WIRE BENDING MACHINE
Frederick Wade Greer, Belmont, Mass., assignor to J. W. Greer Company, Cambridge, Mass., a corporation of Massachusetts
Application October 28, 1932, Serial No. 639,983
12 Claims. (Cl. 140—105)

1. In a machine for making wire belt sections, the combination of means for making, in a length of wire, oppositely disposed offset sections connected by transversely bent portions of the wire, and means for crimping said transverse portions.

2,001,274
JOINTED ASH PAN FOR COMBUSTIBLE GAS GENERATORS
John S. Haug, Philadelphia, Pa., assignor to United Engineers and Constructors, Inc., Philadelphia, Pa., a corporation of Delaware
Application June 29, 1932, Serial No. 619,833
8 Claims. (Cl. 110—165)

1. A grate for a combustible gas generator including an ash pan having an annular outer portion, an annular inner portion adjacent thereto,

and means connecting said portions and providing for relative radial movement therebetween.

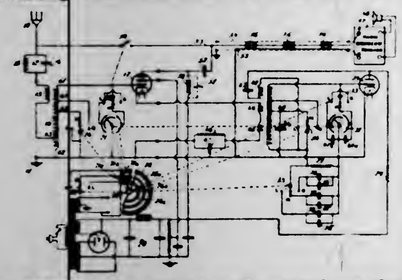
2,001,275
ETHER OF HYDROABIETYL ALCOHOL
Clyde O. Henke, Wilmington, Del., and Milton A. Prahl, Milwaukee, Wis., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application September 20, 1933, Serial No. 690,232
17 Claims. (Cl. 260—149)

1. A compound of the general formula

$$Ab—CH_2—O—R,$$

where Ab stands for the hydrocarbon nucleus of a hydroabietic acid while R stands for an alkyl, aralkyl or cycloalkyl radical.

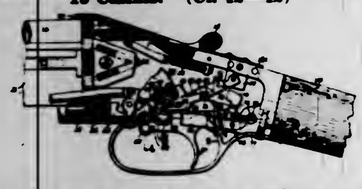
9. The process of preparing an ether, which comprises reacting an alkali-metal hydroabietyl alcoholate with an organic halide of the alkyl, aralkyl and cycloalkyl series which may be substituted by sulfo groups.



2,001,276
LAMINATED CELLULOSE UNIT AND PROCESSES OF MAKING SAME
Irving Fink Laucks, Seattle, Wash., assignor to I. F. Laucks, Inc., Seattle, Wash., a corporation of Washington
No Drawing. Application November 21, 1932, Serial No. 643,739
8 Claims. (Cl. 20—91)

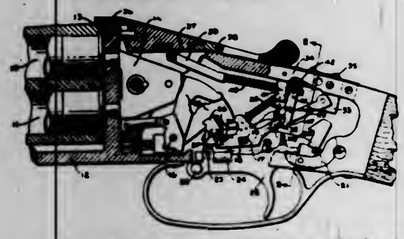
1. A cellulose unit composed of laminations of cellulosic material bound together with a substantially uninterrupted film of an adhesive oxycellulose viscose.

2,001,277
SHORT WAVE CONVERTER
Harold Miller Lewis, Douglaston, N. Y., assignor to Hazeltine Corporation
Application September 25, 1931, Serial No. 565,024
21 Claims. (Cl. 250—36)



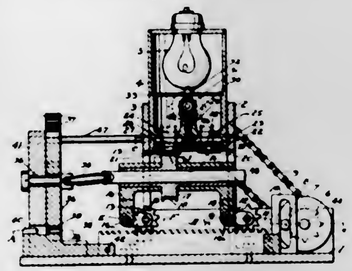
2. An oscillation generator for generating a current of any frequency in a plurality of wave bands, comprising a vacuum tube having plate, grid and cathode electrodes, a grid circuit for determining the frequency to be generated, connected between the grid and cathode, said circuit comprising an adjustable inductance in series with a capacity adjustable in steps, shunted by a continuously variable condenser, a control member for operating said variable condenser, a feed-back circuit between plate and

cathode, having an inductance magnetically coupled with said first mentioned inductance, and including said adjustable capacity, and switch-



ing means, operated by said control member to simultaneously change the values of said adjustable inductance and said adjustable capacity.

2,001,278
FIREARM
Crawford C. Loomis, Ilion, N. Y., assignor to Remington Arms Company, Inc., a corporation of Delaware
Application June 9, 1932, Serial No. 616,234
15 Claims. (Cl. 42—42)

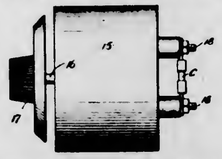


1. In a firearm comprising a plurality of firing hammers movable from cocked position to fired position and a plurality of sears associated respectively with said hammers, in combination, a single trigger, a connector between said trigger and said sears, said connector being shiftable from cooperative relation with one of said sears to cooperative relation with another of said sears, and a spring impelled connector actuator independent of said sears, controlled by one of said firing hammers and comprising a cam surface adapted to engage and shift said connector when said hammer is moved to fired position.

2,001,279
FIREARM
Crawford C. Loomis, Ilion, N. Y., assignor to Remington Arms Company, Inc., a corporation of Delaware
Application August 1, 1933, Serial No. 683,110
5 Claims. (Cl. 42—70)

1. In a firearm of the tilting breech type, in combination, a breech locking mechanism, a firing hammer having a cocked position and a fired position, a sear, a safety device for holding said sear in engagement with said firing hammer when in cocked position, and a supplemental safety device actuated by said breech locking mechanism and engaging said sear to hold the same against both forward and backward rotation when the breech is unlocked.

2,001,280
STEREOSCOPIC MOVING PICTURE FILM PRINTING MACHINE
Karl F. Marx, Dearborn, Mich.
Application April 10, 1933, Serial No. 665,272
5 Claims. (Cl. 95—75)



1. A printing machine for stereoscopic moving picture films comprising a light proof case, a light source therein, two openings in said case for the passage of light therethrough, a shutter operable to uncover alternately said two openings, means for intermittently moving a negative film opposite each of said openings in printing relation thereto, in synchronism with the said shutter, and means for passing a positive moving pictures film in the same direction and in printing relation with said negative films and alternately contacting with said negative films whereby to make one exposure upon the positive film through one of the negative films and then another exposure consecutively upon the same positive film through the other negative film.

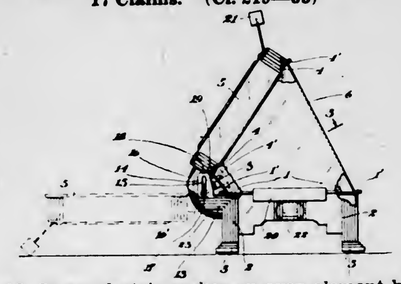
2,001,281
SEMIABRASIVE FABRIC
Daniel J. Mayer, Belleville, N. J., assignor to Metal Textile Corporation, West Orange, N. J., a corporation of Delaware
Application April 3, 1933, Serial No. 664,073
1 Claim. (Cl. 66—202)

A semi-abrasive fabric comprising a composite body made of alternate vegetable fibre and metallic ribbon-like rows of intermeshed strands, the alternate rows of vegetable fibre strands serving to render said fabric yieldable readily absorbent and flexible while also cushioning the abrasive action of the sharp abrasive edges of said metallic ribbon-like strands, whereby the scouring action of said metallic strands is rendered mild and non-injurious.

2,001,282
ELECTRICAL DEVICE
Alexander Nyman, Dobbs Ferry, N. Y., assignor to Dubilier Condenser Corporation, New York, N. Y., a corporation of Delaware
Application October 1, 1925, Serial No. 59,876
Renewed April 20, 1932
9 Claims. (Cl. 175—41.5)

1. The combination of a variable condenser having a fixed member and a movable member adapted to give substantially a straight line wave length relation, and a condenser of constant and relatively small capacity bridged across the terminals of the variable condenser and cooperating therewith to change the capacity relation of said members to one more closely approximating a straight line frequency relation.

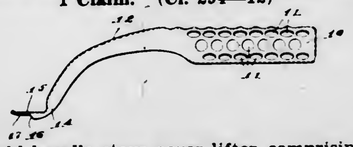
2,001,283
GARMENT
Charles D. Perillat, Worcester, Mass., assignor to Hazelton-De Bevoise Inc., Worcester, Mass., a corporation of Massachusetts
Application June 27, 1933, Serial No. 677,779
3 Claims. (Cl. 2—30)



1. A foundation or form-fitting garment having an extensible panel constituting the back of the garment, a non-extensible panel constituting the front of the garment, the edges of the panels being attached to each other alongside seams throughout the extent of the panels, the upper part of the extensible panel at the waist line of the garment being wider than the lower edge of the extensible panel to enable the waist portion of the garment to be pulled up over the hips, the upper edge of the extensible panel being cut on the bias from the shoulders toward the waist line.

2,001,284
MANUFACTURE OF ANILINE FROM CHLOROBENZENE AND AMMONIA
Walter Prahl and Wilhelm Mathes, Ludwigshafen-on-the-Rhine, Germany, assignors to Dr. F. Raschig G. m. b. H., Ludwigshafen-on-the-Rhine, Bavaria, Germany, a firm of Germany
No Drawing. Application October 14, 1931, Serial No. 568,866. In Germany October 23, 1930
14 Claims. (Cl. 260—130.5)

3. The process of manufacturing aniline by passing a mixture of chlorobenzene vapor and ammonia at a temperature of about 250° C. to about 450° C., over a catalyst which consists mainly of at least one of the compounds phosphoric acid, vanadic acid, molybdic acid and tungstic acid and at least one of the metals copper, cobalt, nickel and iron, the catalyst being precipitated on a suitable carrier.



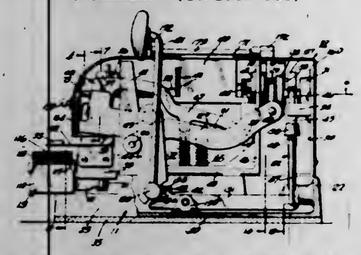
14. The process of manufacturing aniline by passing a mixture of chlorobenzene vapor and ammonia at a temperature ranging from about 250° C. upward to a temperature at which the reaction becomes unfavorable over a catalyst consisting mainly of at least one element of those found in groups 5 and 6 of the periodic system which is solid at room temperature and forms salts which are not precipitated by ammonium sulfide as hydroxides from their aqueous solutions, and at least one of the metals copper, cobalt, nickel and iron.

2,001,285
ELECTRIC COOKER
William C. Rehm, Meriden, Conn., assignor to Manning, Bowman & Co., Meriden, Conn., a corporation of Delaware
Application May 5, 1934, Serial No. 724,081
17 Claims. (Cl. 219—35)

13. In an electric cooker an oven element having two heat exposure sides whose peripheral edges define planes at an angle to each other and adapted to be housed within and inserted between two similary angularly disposed heating plates of an electric heater with the walls thereof reflecting the heat from the plates to the article being cooked.

2,001,286
COLD HANDLE STOVE COVER LIFTER
George C. Reith, Revere, Mass.
Application April 15, 1933, Serial No. 666,303
1 Claim. (Cl. 294—12)

A cold handle stove cover lifter comprising in combination a cylindrical and perforated handle portion, said handle portion being partially closed at its rear end and open at the front under side, an inverted U back portion comprising a continuation of material forming the top and side portions of said handle, an engaging end portion having a flattened top formed from the top of said U back portion, the under side of said engaging portion comprising folded under reinforcing members comprising continuations of the sides of said U back portion, reinforcing vertically disposed flanges located below and adjacent the back portion of said engaging end, said flanges



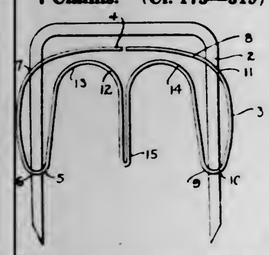
being continuations of the sides of said U back portion and connecting with said folded reinforcing portion by means of side curved brackets.

2,001,287

HAND OPERATED POSTAL MACHINE

Commodore D. Ryan, Los Angeles, Calif., assignor to National Postal Meter Company, Los Angeles, Calif., a corporation of California

Application May 31, 1933, Serial No. 673,639
9 Claims. (Cl. 101—301)



1. In a postal machine, the combination of: a platen; a printing die movable to and from said platen; a unidirectional driven shaft; means on said driven shaft for actuating said die as aforesaid; a meter adapted to register each rotation of said driven shaft and lock said shaft upon completion of a predetermined number of rotations; a pulley rotatably mounted on said driven shaft; ratchet means for transmitting rotation of said pulley to said driven shaft; and means for driving said pulley.

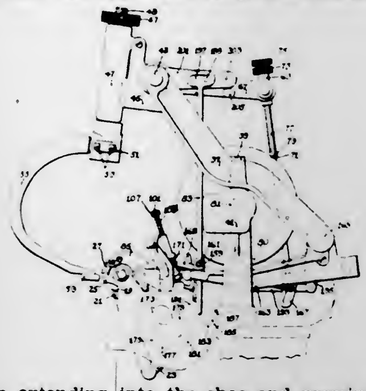
2,001,288

INSULATED STAPLE

Max Schorr, Houston, Tex.

Application June 4, 1934, Serial No. 728,984
7 Claims. (Cl. 173—319)

1. An insulated two prong staple including a staple member, an insulating piece bent and perforated to be received on the prongs of said staple whereby a plurality of wires may be held in fixed position by said piece and within said staple, and a downwardly extending tongue on said insulating piece positioned to project between the wires being fixed, to separate the wires and insulate them from each other.



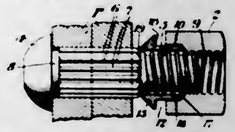
2,001,289

SHOE SEWING MACHINE

Cyril Cathy Sheffield and George Clarke, Leicester, England, assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey

Application January 5, 1934, Serial No. 705,404
In Great Britain January 7, 1933
4 Claims. (Cl. 112—60)

1. A shoe sewing machine for sewing the lower edge of an upper to the out-turned flange formed on a rim upstanding from the tread portion of the sole having, in combination with the stitch forming devices, a work support shaped and arranged to support the outturned flange of the shoe sole, a presser foot cooperating with the work support to clamp the upper and flange intermittently, a



horn extending into the shoe and pressing the rim of the shoe sole against the edge of the work support, and means for moving the horn away from the work support during each stitch forming cycle to facilitate feeding of the work.

2,001,290

MEANS FOR FORMING A FLUID-TIGHT JOINT

Robert Thomson, Arlington, N. J., assignor to Dardelet Threadlock Corporation, New York, N. Y., a corporation of Delaware

Application June 17, 1933, Serial No. 676,262
6 Claims. (Cl. 85—1)

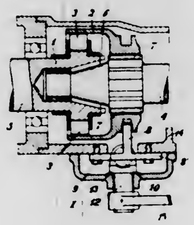
1. Means to form a fluid-tight joint, comprising a bolt and nut of the type wherein the bolt has a head and a reduced screw-threaded end portion at opposite ends of a non-screw-threaded shank portion whose periphery has corrugations therealong and therearound, for the purpose set forth, and the diameter of the corrugated portion exceeds that of the threaded portion, and wherein the bore of the nut is enlarged in the base of the nut to receive one end of the corrugations, and an extrusile sealing washer of softer metal than the bolt and nut and having a head at one end of outwardly tapering wedge-like form in radial cross-section and a tubular shank of reduced external diameter fittable into the enlarged portion of the nut bore and of greater length than the enlarged portion of the bore, the bore of the washer being of sufficient size for fitting of the washer head-first over the threaded end of the bolt but smaller than the corrugated portion of the bolt, to abut the washer against the adjacent ends of the corrugations, and the abutting extremity of the headed end of the washer not exceeding the adjacent end of the corrugated portion of the bolt in external diameter, whereby when the nut is screwed against the washer the metal of the washer will be extruded by consequent heat and pressure into the nut and into the grooves between the bolt corrugations.

2,001,291

SUPPORTING DEVICE

Josef C. Tonko, Detroit, Mich.

Application November 22, 1933, Serial No. 699,184
4 Claims. (Cl. 24—3)



1. A supporting device comprising a hook member, a member having pointed projections pivotally mounted on said hook member, and a fastening member received on said pointed projections, said fastening member having spaced walls on the opposite sides of said pointed projections, one wall thereof having indentations in its inner surface to receive the points of said pointed projections.

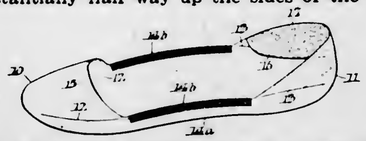
2,001,292

CLUTCH DEVICE FOR MOTOR VEHICLES

Alfred Graf von Soden-Fraunhofen and Albert Maier, Friedrichshafen, Germany, assignors to Zahnradfabrik Friedrichshafen Aktiengesellschaft, Friedrichshafen, Germany

Application February 16, 1933, Serial No. 657,007
In Germany February 26, 1932
2 Claims. (Cl. 192—67)

1. A device for shifting one positive clutch member into and out of engagement with another comprising: a member in operative connection with said first clutch member, a wedge-shaped element adapted to co-operate with said member, a spring pressing against said element and adapted to force said member into one of its end positions, said member having an unsymmetrical notch, one side thereof being smooth the other one having a broken side face.



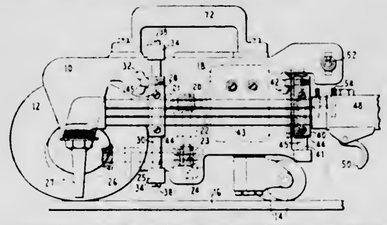
2,001,293

KNITTED STOCKING FOOT PROTECTOR

Wallace Wilson, Philadelphia, Pa.

Original application February 10, 1934, Serial No. 710,606. Divided and this application July 11, 1934, Serial No. 734,575
9 Claims. (Cl. 66—171)

1. As a new article of manufacture, a knitted stocking foot protector having a heel, a toe, and a connecting sole portion of a width to extend substantially half way up the sides of the foot,



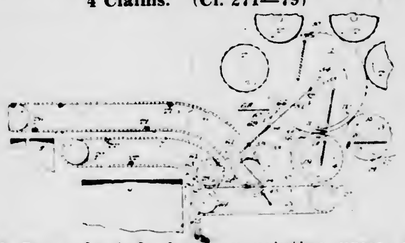
said sole portion comprising knit-in edge margins of elastic yarn.

2,001,294

METAL CUTTING MACHINE

James L. Anderson, Closter, N. J., assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York

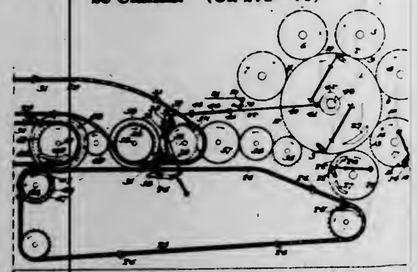
Application October 21, 1932, Serial No. 638,836
15 Claims. (Cl. 266—23)



1. Cutting apparatus comprising a support, means including a traction wheel mounted to move in any direction over the surface of the work, a motor mounted on said support in driving relation to and movable with said traction wheel, and a torch supported on said support with the torch tip beside said traction wheel in position to direct a jet against the work substantially at the point where said traction wheel contacts with the work, so that the wheel travels along the edge of the cut as the support moves over the work.

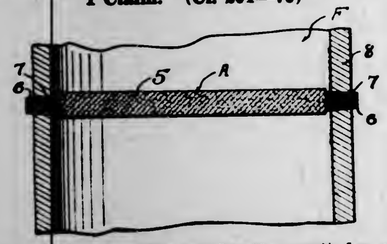
2,001,295

SHEET DELIVERY MECHANISM FOR PRINTING PRESSES



Howard M. Barber, Pawcatuck, Conn., assignor to C. B. Cottrell & Sons Company, Westerly, R. I., a corporation of Delaware

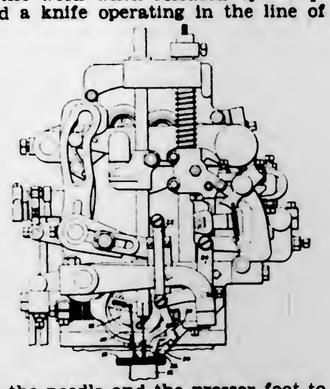
Application July 31, 1934, Serial No. 737,688
4 Claims. (Cl. 271—79)



1. In a sheet feed rotary printing press, an impression cylinder and a flat sheet delivery therefor, comprising a sheet transfer endless chain carrier, a plurality of sheet delivery endless chain carriers coacting therewith to take alternate sheets from the sheet transfer endless carrier at different points thereon, and means for driving the sheet transfer endless chain carrier and the sheet delivery endless chain carriers all at the same surface speed as the impression cylinder.

2,001,296
SHEET DELIVERY MECHANISM FOR PRINTING PRESSES
Howard M. Barber, Pawcatuck, Conn., assignor to C. B. Cottrell & Sons Company, Westerly, R. I., a corporation of Delaware
Application January 5, 1935, Serial No. 515
25 Claims. (Cl. 271—76)

1. In a sheet feed rotary printing press, an impression cylinder and a sheet transfer endless chain carrier, both traveling at substantially the same surface speed, and a plurality of sheet delivery endless chain carriers traveling at a lesser surface speed and arranged to take alternate sheets from the sheet transfer endless chain carrier at said lesser surface speed.

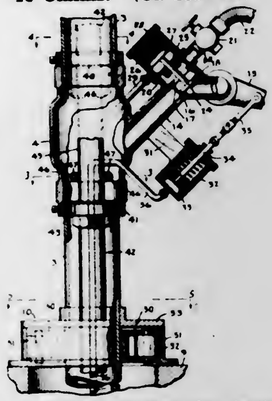


2,001,297
ELECTRICAL RESISTANCE UNIT
Carroll H. Boyles, Milwaukee, Wis., assignor to Heating Unit Corporation, Cedarburg, Wis., a corporation of Wisconsin
Application December 19, 1931, Serial No. 582,093
1 Claim. (Cl. 201—76)

An electrical resistance heating unit for electrical furnaces and the like comprising, an integral structure including an elongated body portion having its ends compressed to provide conductor terminals of less diameter than the body and of a greater density than the body, said body and ends being formed from the same type of material throughout their entire lengths.

2,001,298
SEWING MACHINE
Albert W. Bradbury, Cliftondale, and Roy E. Hood, Lynn, Mass., assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application February 8, 1934, Serial No. 710,238
6 Claims. (Cl. 112—45)

1. A sewing machine of the McKay type having, in combination, stitch forming and work feeding devices including a straight hook needle, a rotary work supporting horn, a presser foot for alternately clamping and releasing the work supported by the horn, a feed point acting on the side of the work engaged by the presser foot to feed the work when released by the presser foot, and a knife operating in the line of feed

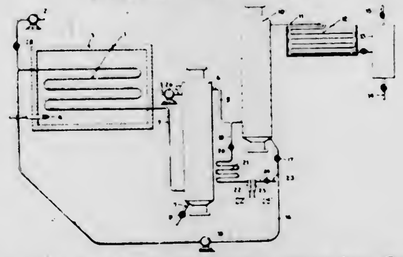


between the needle and the presser foot to form a stitch receiving groove in the work.

2,001,299
MANUFACTURE OF COPPER AMMONIUM SALTS OF DIAZO AMINO TETRAZOLE
Willi Brün, Bridgeport, Conn., assignor to Remington Arms Company, Inc., a corporation of Delaware
No Drawing. Application December 14, 1932, Serial No. 647,220
7 Claims. (Cl. 260—12)

1. In the manufacture of a copper ammonium salt of diazo amino tetrazole by the reaction upon a soluble salt of diazo amino tetrazole of first a solution of a cupric salt and second acetic acid and ammonia, the method which comprises the addition of the ammonia dropwise until a measured excess is present, thereby securing a precipitate of the substantially pure crystalline copper ammonium salt and preventing the precipitation of undesirable impurities.

2,001,300
FIRE PROTECTION STANDPIPE SYSTEM
William F. Conran, Brooklyn, N. Y.
Application June 29, 1931, Serial No. 547,617
13 Claims. (Cl. 169—16)

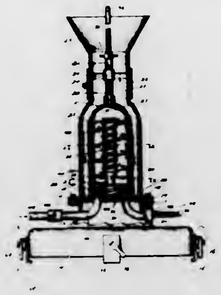


3. In a standpipe system for buildings, the combination of a movable standpipe having nozzle fittings at different levels, a fluid actuated valve in each fitting, grouped control lines extending from said valves along the outside of the standpipe to a control station, a sectional enclosure for said grouped control lines, and detachable

connections securing sections of said enclosure to said nozzle fittings.

6. In a standpipe system for buildings, the combination of a vertically movable and rotatable standpipe having nozzle branches at different levels, fluid-actuated means associated with said nozzle branches, control lines passing from said fluid-actuated means along the outside of the standpipe to a control station, and bearings for said standpipe, each of said bearings comprising a floor-plate and a rotatable part which turns on the floor-plate with the standpipe and in which the standpipe is vertically movable, said rotatable part having openings through which said control lines pass, and anti-friction members between the standpipe and said rotatable part.

8. In a fire-extinguishing standpipe system for buildings, the combination of a nozzle and a nozzle valve carried by the standpipe, a hose connection with a hose valve likewise carried by the standpipe and in the same general vicinity with said nozzle and nozzle valve, and remote control means operable from a station away from the heat zone of a fire in the space protected by said nozzle and nozzle valve, to open said nozzle valve and simultaneously shut off communication between said hose valve and the standpipe.

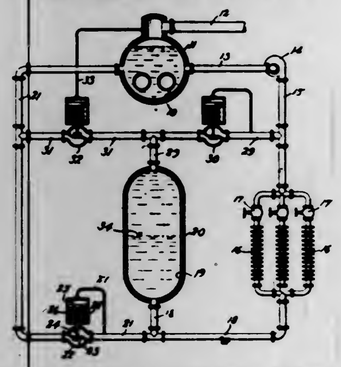


2,001,301
METHOD FOR CONVERTING HYDROCARBON OILS
Luis de Florez, Pomfret, Conn., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application August 31, 1932, Serial No. 631,224
9 Claims. (Cl. 196—48)

9. In a cracking system for hydrocarbon fluids wherein the fluid is passed through a heating zone and therein raised to a conversion temperature, the thus heated fluid being thereafter separated into vaporous and liquid constituents and the vaporous constituents passed through a fractionating zone to form a cycle condensate for the cracking system, the improvement that comprises condensing a portion of the vaporous constituents to determine the color of said condensed portion prior to the collection of the cycle condensate in the fractionating zone, utilizing the color of said condensed portion as a criterion of the cleanliness of the cycle condensate collected in the fractionating zone and controlling operating conditions of the cracking system in response to variations in color to thereby prevent objectionable carbon formation in the heating zone.

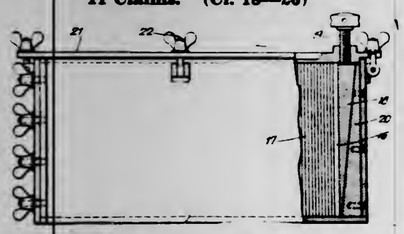
2,001,302
PORTABLE GEAR CASE CLEANER
James K. Delano, New York, N. Y.
Application March 17, 1934, Serial No. 716,041
4 Claims. (Cl. 184—1.5)

1. In a portable cleaning device for gear casings, the combination with a tubular member having a drainage funnel and an injection device, of a heating chamber formed within said tubular member and communicating with the injection device, a heating means mounted therein and adapted to heat the same, means for feeding



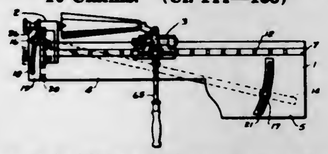
air to said heating chamber, means for regulating the rate of such feed, means for retarding the passage of the air through said heating chamber, and means for mounting said cleaning device adjacent to the gear casing.

2,001,303
CAN OPENER
Philip H. Farrell, Flushing, N. Y.
Application May 11, 1933, Serial No. 670,394
4 Claims. (Cl. 30—3)



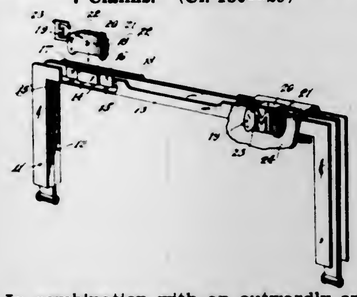
1. In a can opener the combination of a supporting arm, said arm having a notch in its front face at the upper end thereof, a supporting bracket fastened to the front face of said arm above said notch, locking heels depending from said bracket, an operative lever pivoted to the upper end of said supporting arm and a knife blade pivoted to the lower end of said operating lever, said supporting arm adapted to support a can with its upper seam positioned in said notch, and the lower edge of the said supporting bracket bearing on the upper face of the seam of the can and the said locking heels positioned opposite the inner face of said seam.

2,001,304
ACCUMULATING SYSTEM
Carl Föhl, Berlin, Germany, assignor to Ruths-accumulator Aktiebolag, Berlin, Germany, a corporation of Sweden
Application December 17, 1931, Serial No. 581,713
In Germany December 18, 1930
21 Claims. (Cl. 237—56)



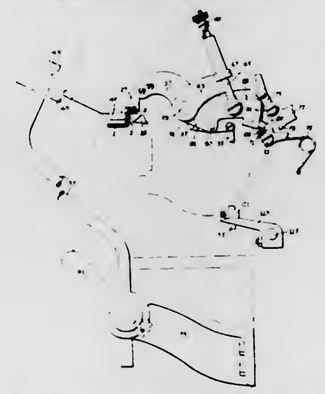
1. In a hot water accumulating system, a hot water generator, a heat consumer and an accumulator interconnected to form a closed system, means for withdrawing hot water from said generator, means responsive to the demand of said consumer for by-passing hot water around said consumer, means for conveying by-passed hot water to said accumulator, means for conveying cold water discharged from said consumers to said accumulator, means for conveying hot water from said accumulator to said generator, means for conveying cold water from said accumulator to said generator, and means operative in accordance with pressure variations in said generator for controlling admission of hot water and cold water, respectively, from said accumulator to said generator so as to maintain the pressure within said generator substantially constant.

2,001,305
METHOD OF AND APPARATUS FOR THE PRODUCTION OF GOODS OF RUBBER OR SIMILAR MATERIAL
Walter George Gorham, Erdington, Birmingham, and Geoffrey William Trobridge, Sutton Coldfield, England, assignors to Dunlop Rubber Company Limited, London, England, a British company
Application May 17, 1934, Serial No. 726,066
In Great Britain December 20, 1929
11 Claims. (Cl. 18—26)



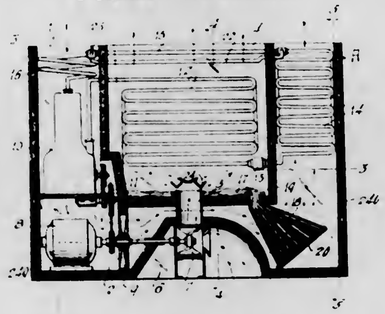
10. Apparatus for forming plates of microporous rubber which comprises a container for aqueous dispersions of rubber, a series of mold plates insertable downwardly into said container and having spacers at their side edges to form mold spaces between successive plates, and means to apply pressure endwise to the plates within said container.

2,001,306
ATTACHMENT FOR SAWING TAPERED MATERIAL
Albert Gressner, Flushing, N. Y.
Application December 10, 1932, Serial No. 646,691
10 Claims. (Cl. 144—138)



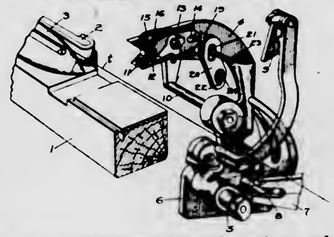
1. A work holding attachment comprising a flat bed plate, a bar extending longitudinally of said bed plate and positioned on the lower side thereof, said bar adjustably held in curved slotted openings in the opposite ends of said bed plate, another bar partially embedded in the upper surface of said bed plate and extending longitudinally thereof, a head stock mounted at one end of said bed plate and extending over the edge thereof, a tail stock slidable on the upper surface of said bed plate and keyed to the bar embedded in said upper surface, means fixedly holding said tail stock in different positions upon said bar, opposed holding means in said head and tail stocks for holding objects therebetween, said holding means in the tail-stock being movable and means for withdrawing said holding means in said tail stock from its engagement with the object held.

2,001,307
HAND BAG
William C. Hiering, Millburn Township, Essex County, N. J., assignor to J. E. Mergott Company, Newark, N. J., a corporation of Delaware
Application July 5, 1933, Serial No. 679,065
7 Claims. (Cl. 150—29)



1. In combination with an outwardly opening channelled bag frame member having covering material attached thereto, said frame member having a plurality of apertures in the bottom wall thereof, a strip having tangs passing through said apertures, said strip being attached to the inner wall of the frame member and having a U-shaped portion to form a pocket with said inner wall, a plate depending downwardly on the outside of the bag covering, said plate having, at its upper edge, a right angularly directed flange, said flange having a downwardly depending portion provided with tangs, said tangs passing through certain of the apertures in the bottom wall of the channel, and an initial letter or other ornamentation attached to said plate.

2,001,308
SHOE SEWING MACHINE
Otto F. Hoppe, Frankfort-on-the-Main, Germany, assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application September 20, 1933, Serial No. 690,207
In Great Britain October 12, 1932
4 Claims. (Cl. 112—60)



1. A shoe sewing machine for sewing the lower beaded edge of an upper to an outturned flange formed on a rim upstanding from the tread portion of the sole having, in combination with the stitch forming devices, a work support shaped and arranged to support the outturned flange on the shoe sole, a presser foot cooperating with the work support to clamp said flange and upper intermittently provided with a groove to receive the bead at the lower edge of the upper, and a horn extending into the shoe and pressing the rim of the sole against the edge of the work support.

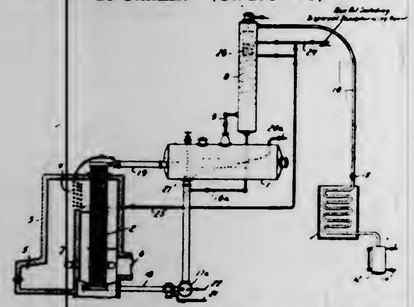
2,001,309
AIR CONDITIONER
Charles P. Kelly, Newark, N. J.
Application October 28, 1933, Serial No. 695,566
3 Claims. (Cl. 62—129)

2. In an air conditioner, a refrigerating unit including an evaporator and two connected condenser sections, means for circulating air to be treated into contact with said evaporator to cool the air, a water collector and diffuser for collecting and diffusing water of condensation from said evaporator, and means for circulating air into contact with one of said condenser sections to heat the air, thence into contact with said collector and diffuser to evaporate the water and thereby cool the air and then circulating the cooled air over the other condenser section to cool the refrigerant gas.

2,001,310
PARTING MEANS FOR LOOMS
Edward C. Nichols, Upton, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Application October 10, 1934, Serial No. 747,758
6 Claims. (Cl. 139—264)

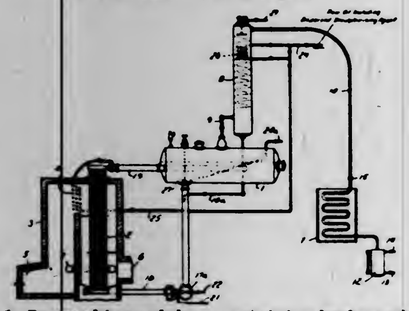
1. In a shuttle feeler thread parter and clamp, the combination of a lay, a shuttle feeler, parting and clamping members pivoted to said shuttle feeler, a depending heel on said members, said heel having a plate adapted to be struck by the lay for closing said members, and means for adjusting said plate toward and from the lay for varying the time of closing of said members.

2,001,311
PLASTIC COMPOSITION
Morris Omansky, Boston, Mass., assignor to E. W. Colledge, General Sales Agent, Inc., Jacksonville, Fla., a corporation of Florida
No Drawing. Application March 31, 1932, Serial No. 602,394
4 Claims. (Cl. 106—22)



1. A plastic composition characterized by being sufficiently workable in the plastic state to permit the production of molded, extruded and similar products therefrom, comprising a plastic synthetic resin of the class consisting of phenol-formaldehyde resins, urea-formaldehyde resins, and glycerin-phthalic anhydride resins, and a filler containing a substantial proportion and at least an amount of finely divided charcoal equivalent to 5% of the weight of the resin, the amount of resin in the plastic composition being less than 43% by volume of the mass and the amount of charcoal being sufficient to render the composition workable in the plastic state so as to permit the production of molded, extruded and similar products.

2,001,312
VOTIVE LIGHT
Timothy M. O'Connell, Philadelphia, Pa.
Application January 31, 1934, Serial No. 709,126
5 Claims. (Cl. 67—21)

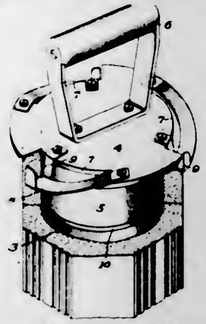


2. In a votive light the combination of a shell formed of a class of substances which are injured by heat, a lining for said shell, said lining being relatively infrangible and noncombustible, and a candle lying entirely within said lining.

2,001,313
ART OF CRACKING HYDROCARBON OILS
Harry L. Pelser, Highland, Ind., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Application February 19, 1929, Serial No. 341,215
10 Claims. (Cl. 196—58)

2. In cracking sulphur-containing hydrocarbon oils by distillation under superatmospheric pressure, the improvement which comprises passing raw oil including a dispersed desulphurizing agent through a primary heating zone into a vaporizing zone in a pressure still, circulating oil free from suspended matter from the vaporizing zone through a secondary heating zone back to the vaporizing zone, heating the oil passing through both heating zones to a cracking temperature, and taking off vapors including vapors of the desired distillate product from the vaporizing zone under superatmospheric pressure.

2,001,314
ART OF CRACKING HYDROCARBON OILS
Harry L. Pelser, Houston, Tex., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Original application February 19, 1929, Serial No. 341,215. Divided and this application February 27, 1931, Serial No. 518,722
4 Claims. (Cl. 196—58)



1. In cracking sulphur-containing hydrocarbon oils by distillation under superatmospheric pressure, the improvement which comprises passing raw oil including a dispersed desulphurizing agent through a primary heating zone into a vaporizing zone in a pressure still, taking off vapors from the vaporizing zone under superatmospheric pressure and subjecting them to a refluxing operation, circulating reflux condensate free from suspended matter from the refluxing operation through a secondary heating zone and thence directly back to the vaporizing zone without permitting circulation of unvaporized oil from the vaporizing zone through the secondary heating zone, heating the oil passing through both heating zones to a cracking temperature, and taking off vapors including vapors of the desired distillate product from the refluxing operation.

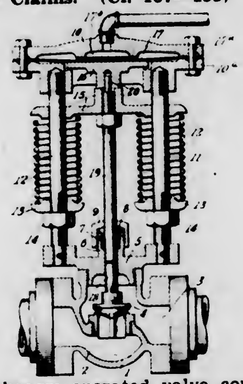
2,001,315
CONDUIT
Robert V. Proctor and Charles B. Cushwa, Youngstown, Ohio, assignors to The Commercial Shearing & Stamping Company, Youngstown, Ohio, a corporation of Ohio
Application February 13, 1932, Serial No. 592,718
3 Claims. (Cl. 72—51)

2. In a conduit, a liner comprising a plurality of liner plates connected to form a circumferential course, the body of each plate being provided with spaced local staggered embossments extending circumferentially of the conduit all of the metal between adjacent embossments in the same circumferential line being flat for withstanding longitudinal tension stresses in the liner, and means for connecting the plates along their sides to adjacent circumferential courses.

2,001,316
CONDUIT AND METHOD OF MAKING THE SAME
Roy A. Shipley, Pittsburgh, Pa., assignor to National Fireproofing Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 20, 1931, Serial No. 545,779
4 Claims. (Cl. 25—156)

1. A method of making a ceramic conduit section, comprising providing a length of ceramic material in plastic state having a duct therethrough, and inserting partially into and bodily turning with respect to said duct a unitarily operable reaming tool having a portion for removing part of the material of said length.

2,001,317
ELECTRIC LAMP SOCKET
Frank W. Slady, Brooklyn, N. Y., assignor to Leviton Manufacturing Company, Brooklyn, N. Y., a copartnership composed of Isidor Leviton and Evser Leviton
Application June 8, 1927, Serial No. 197,261
20 Claims. (Cl. 173—362)



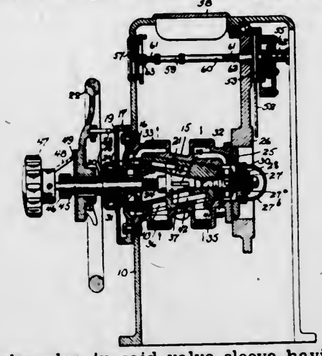
1. In an electric light socket, a shell and cap, a longitudinally extending slot near the upper

end of said shell, tongues substantially parallel to the axis of the cap extending inwardly along the skirt of said cap having their free ends point-

ing upwardly, said tongues having cut metal edges adapted to contact with the edges of said slot when said shell and cap are assembled.

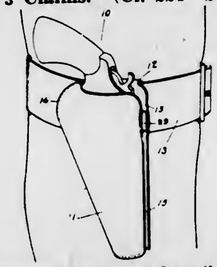
2,001,318
VALVE
Paulsen Spence, East Orange, N. J.
Application June 18, 1931, Serial No. 545,225
5 Claims. (Cl. 137—153)

1. A diaphragm-operated valve comprising a body having two chambers therein, a valve head, a hood secured to said body, said hood having a bore therethrough, a valve stem guided within said bore, a plurality of springs supported by said hood, a yoke supported by said springs, diaphragm means for moving said yoke, and means for loosely coupling said yoke and said stem, said yoke and said springs being located intermediate said hood and said diaphragm, said springs, yoke and diaphragm means being bodily carried by said hood and removable as a unit therewith.



2,001,319
CABLE
George J. Stanley, Pittsburgh, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
Application April 28, 1932, Serial No. 608,038
3 Claims. (Cl. 173—13)

1. As an article of manufacture, a cable comprising a steel core covered with a spirally wound strip of aluminum foil adhesively secured to said steel core, and a plurality of aluminum conductors overlying the aluminum foil winding.

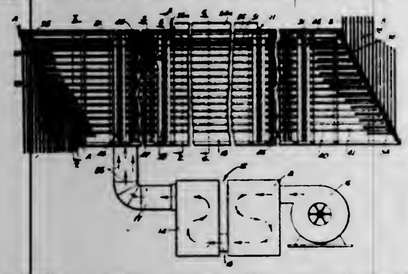


2,001,320
CONTROL APPARATUS
James E. Williamson, Maplewood, N. J.
Application December 10, 1930, Serial No. 501,233
3 Claims. (Cl. 277—41)

1. A control apparatus comprising a substantially cylindrical valve casing with radially spaced ports on its periphery, a valve sleeve rotatable in the casing and having passages disposed to register with selected ports of the casing, and a rotat-

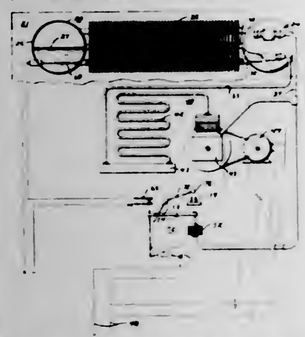
able valve plug in said valve sleeve having imperforate ends and having only transverse passages to establish communication between the passages of the sleeve.

2,001,321
REVOLVER HOLSTER
John Emmett Berns, Bremerton, Wash.
Application September 6, 1932, Serial No. 631,745
3 Claims. (Cl. 224—2)



1. A holster of the class described embodying a case member provided with an open slot in the front and upper portions thereof, through which a revolver may be inserted into the holster and withdrawn therefrom, the edges of the holster around said front slot extending forwardly to provide a guard for the sights of the revolver; a curved pocket in the upper rear portion of the holster to receive the upper rear curved part of the trigger guard member of a revolver; a revolver barrel end supporting member in the lower end portion of the holster; and a spring member positioned in the holster adapted to frictionally engage a revolver and to releasably hold said rear curved part of the trigger guard member of the revolver in said curved pocket of the holster, thereby frictionally retaining the revolver in said holster.

2,001,322
MULTIPLE FILM HANDLING DEVICE
Bruce Burns and Howard B. Lewis, Los Angeles, Calif., assignors, by mesne assignments, to Hughes Industries Co., Ltd., Los Angeles, Calif., a corporation of Delaware
Application April 25, 1931, Serial No. 532,809
7 Claims. (Cl. 34—48)

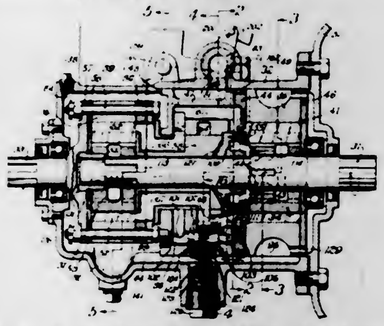


6. A film handling device of the character described, including: walls forming an elongated

horizontal duct having an upright side wall structure; a film passage formed along said side wall structure, there being removable cover means forming the outer wall of said film passage and a plurality of horizontal walls extending from said side wall structure so as to form a plurality of film channels in said film passage; a plurality of rollers associated with each of said horizontal walls and so disposed as to support

a separate motion picture film out of contact with said horizontal wall; means for pulling said separate motion picture films through each of said film channels while said separate films are supported by said rollers in said respective film channels; aperture means in said side wall structure providing communication between said duct and said film passage; and means for producing a flow of fluid through said aperture means.

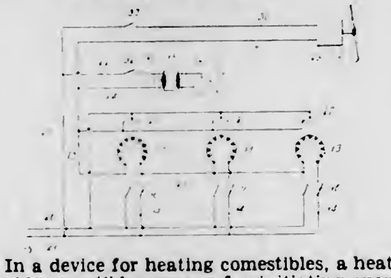
2,001,323
REFRIGERATING APPARATUS
Herman J. Dick, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application April 29, 1931, Serial No. 533,739
9 Claims. (Cl. 62—4)



1. An intermittently operated refrigerating system comprising in combination a cooling element, a refrigerant circulating element adapted to supply refrigerant to said cooling element, said cooling element being maintained normally below a predetermined temperature range, means responsive to normal conditions within said system for controlling the operation of said refrigerant circulating element, an artificial heating element located within the walls of said cooling element and arranged to apply its heat directly to refrigerant in the cooling element for defrosting said cooling element, and means for simultaneously rendering said heating element effective and for rendering said first named means ineffective to normal conditions within said system.

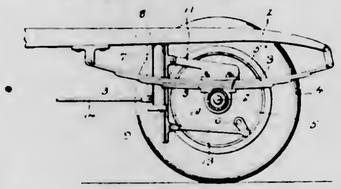
2,001,324
TELEPHONE SHELF
Edwin L. Early, Kansas City, Kans., assignor of one-half to Nell W. Crouch, Kansas City, Kans.
Application April 6, 1933, Serial No. 664,768
2 Claims. (Cl. 312—112)

1. A telephone shelf adapted to be hung on a substantially vertical wall and to combine therewith in forming a book housing, comprising a horizontal pedestal; a panel depending from the pedestal in spaced, parallel relation with the supporting wall, said pedestal extending forwardly from said panel an appreciable distance and rearwardly to the supporting wall; a ledge carried by the panel adjacent the lower edge thereof and extending from the panel to the wall to support a book between the two; a bracket along one vertical edge of the panel extending rearwardly to close the space between pedestal, panel, ledge and wall and forwardly to provide a support for the forwardly extending portion of the pedestal; and another bracket along the other vertical edge of the panel extending forwardly from the latter an equal distance beneath the pedestal as the other bracket, said first mentioned bracket having a hole formed therethrough in the portion thereof closing the space between pedestal, panel, ledge and wall whereby to allow insertion of a finger to push the book from the said housing.



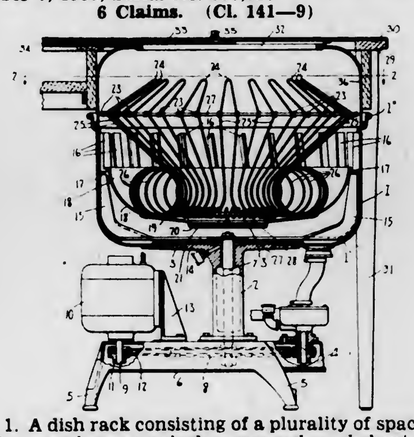
2,001,325
HYDRAULIC TRANSMISSION
Clifford E. Ives, Wilmette, Ill.
Application April 9, 1932, Serial No. 604,163
43 Claims. (Cl. 60—19)

34. In a hydraulic transmission, a stationary casing, a power input shaft projecting into the casing, a power output shaft projecting into the casing, rotary hydraulic pump means for transmitting movement from the power input shaft to the power output shaft within the casing, said casing being entirely filled with oil and shaped so that a centrifugal propelling action of the oil is caused by the rotary pump, a separate oil tank, means for utilizing said propelling action for delivering oil from the casing to said tank, and means for delivering oil from said tank back to said casing.



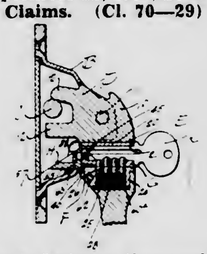
35. In a hydraulic transmission for an automobile, a power input shaft, a power output shaft, hydraulic means for coupling said shafts to drive said output shaft in forward or reverse direction in a full range of speed ratios, means actuated by the speed of the output shaft for controlling the speed ratios between said shafts, wherein said control means includes centrifugal devices carried by the output shaft, an adjustable control element and a connection for actuating said control element oy the movement of said centrifugal devices, an engine foot throttle, said control element having a connection to said engine foot throttle, and being initially actuated as an incident to depressing the foot throttle to couple said shafts hydraulically whereby the centrifugal devices are thereby rendered effective.

2,001,326
ELECTRIC RANGE
Robert John, New York, N. Y.
Application June 27, 1932, Serial No. 619,570
9 Claims. (Cl. 219—37)



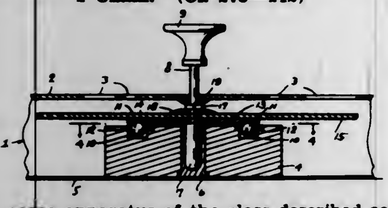
1. In a device for heating comestibles, a heater for said comestibles, means for initiating operation of said heater, a device for eliminating odors produced by said heated combestibles, said means also being effective to initiate operation of said odor eliminating device and means responsive to the temperature of said heater and comestibles to continue the operation of said odor eliminating device after said heater has been rendered inoperative and to discontinue the operation of said odor eliminating device when the temperature of said heater and comestibles drops to a predetermined point.

2,001,327
LEVERAGE CHANGING MECHANISM FOR MOTOR VEHICLE BRAKES
Ernest C. Johnson, Somerset, Pa.
Application February 19, 1934, Serial No. 712,028
3 Claims. (Cl. 188—195)



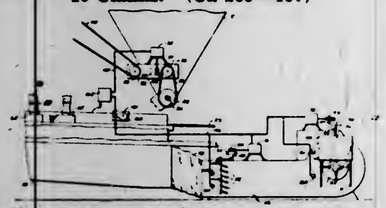
1. A power means for motor vehicle brakes comprising a fulcrum bar having a fixed fulcrum adjacent one end and connected to a brake operating lever adjacent its opposite end, and a force applying means slidably connected to the bar and influenced by varying loads to change its point of connection with said bar between the latter's fixed fulcrum and its connection to the brake operating lever.

2,001,328
DISHWASHING MACHINE
Michael J. Kehoe, Springfield, Ohio
Original application May 26, 1931, Serial No. 540,102. Divided and this application November 7, 1933, Serial No. 697,017
6 Claims. (Cl. 141—9)



1. A dish rack consisting of a plurality of spaced wire members annularly arranged, each bent to form an inwardly and upwardly inclined loop and laterally spaced downwardly directed rods, said loops being spaced one from the other, and means connecting said members, each of said rods having its free end bent into the form of a ring located in a vertical plane.

2,001,329
LOCK MECHANISM
Arthur G. Lyons, Pennside, and William S. Diehl, Shillington, Pa., assignors, by mesne assignments, to The Dent Hardware Company, Fullerton, Pa., a corporation of Pennsylvania
Application September 22, 1932, Serial No. 634,388
3 Claims. (Cl. 70—29)

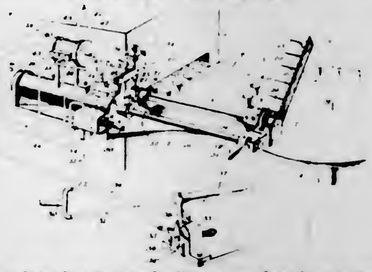


2. In a closure fastener the combination of a supporting casing, a latch bolt movably mounted upon the supporting casing, a pivoted handle for actuating the latch bolt, a rotatable plug upon the handle, key actuated means for locking the plug against rotation upon the handle, said casing having a keeper opening therein, a bolt mounted upon the plug and extending into said keeper opening of the casing having a side formed to bind against an edge of the keeper opening when the handle is in one position, to prevent pivotal movement thereof, said bolt being shaped to clear said edge of the keeper opening when the bolt is in another position to permit pivotal movement of said handle.

2,001,330
GAME APPARATUS
Hugh McKeever, Tulsa, Okla.
Application October 3, 1934, Serial No. 746,711
1 Claim. (Cl. 273—142)

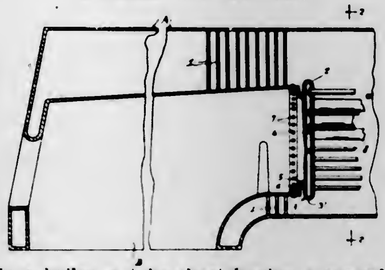
A game apparatus of the class described comprising a casing including a top having a plurality of windows therein, a base fixed on the bottom of the casing, said base having recesses in its top, a thrust bearing mounted vertically in the base, a spindle journaled in the thrust bearing and extending upwardly through the top of the casing, said spindle including an enlarged lower end portion providing a shoulder and further including a threaded portion immediately above said shoulder, a turntable mounted on the spindle and engaged on the shoulder, a dial mounted on the spindle and resting on the turntable, a nut threaded on the spindle, a cleat interposed between the nut and the dial for securing the turntable and the dial to the spindle for rotation therewith, said dial having indicia thereon observable through the windows, an actuating knob on the upper end of the spindle, the turntable having indentations in its lower side, shafts mounted in the base and traversing the recesses in said base, and rotary balls mounted on the shafts and engageable in the indentations for bringing the dial to a stop in predetermined positions.

2,001,331
PROCESS AND MECHANISM FOR SEPARATING INTERMIXED DIVIDED MATERIALS
Rembrandt Peale, Jr., St. Benedict, Pa., assignor, by mesne assignments, to Peale-Davis Company, Wilmington, Del., a corporation of Delaware
Application September 23, 1930, Serial No. 483,856. Renewed September 27, 1934. In Germany December 7, 1929
10 Claims. (Cl. 209—467)



1. In a mechanism for separating intermixed divided materials including in combination an air-pervious deck, an air chamber, a member in the chamber below the deck containing a plurality of aperaures for admitting air to the deck and means for controlling passage of air through said apertures comprising apertured stoppers.

6. The process of purifying coal which comprises subjecting a substantial bed of raw coal to vibration and lifting and loosening air currents to stratify and separate the coal and heavy impurities, progressing the flotant coal stratum to discharge and concurrently effecting a transverse size classification thereof, extracting a selected portion of the coarser coal in the discharging coal stream as middlings and extracting finer middlings from another portion of said stream, and returning the middlings to the bed for additional separating action.

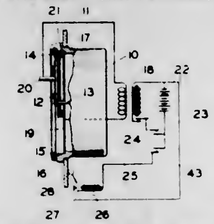


9. Mechanism for separating intermixed divided materials including in combination an air-pervious deck, means for maintaining thereon a traveling bed of raw material undergoing pneumatic stratification and separation including a mechanically-actuated feeder for regulably supplying raw materials to the deck, a member contacting with the surface of the bed on the deck and movable in conformity to changes in the depth of the bed, and devices controlled by said member for regulating the feeder thereby to vary the supply of raw material to the bed in accordance with variations in depth thereof, a motor-driven fan for supplying air under pressure to the bed, a regulating device for varying the amount of air supplied by the fan, and devices controlled by said member for actuating the fan-regulating device.

2,001,332
LEER LOADER
James W. Ross, Washington, Pa., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
Application May 31, 1933, Serial No. 673,725
11 Claims. (Cl. 198—31)

1. A leer loader including a pusher bar extending across the face of the leer when in operative position, said bar being pivotally mounted at one end at one side of the leer, means for moving the bar toward and from the front of the leer, and means for swinging the free end of the bar up and down across the front of the leer in substantially vertical planes parallel with the front of the leer.

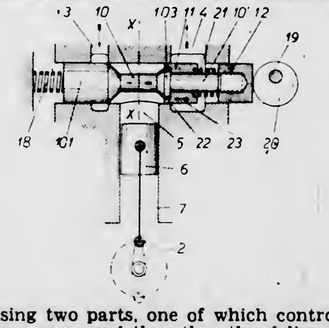
2,001,333
TUBE SHEET FOR BOILERS
Joseph R. Smith, Cumberland, Md.
Application July 25, 1934, Serial No. 736,934
1 Claim. (Cl. 122—512)



In a boiler, a tube sheet having a spaced re-entrant flange joined marginally thereto by an outwardly curved portion, said re-entrant flange terminating at its inner edge in an outwardly disposed U-shaped portion having a lateral attaching flange extending from the free end thereof.

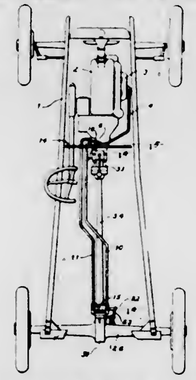
2,001,334
COUPLER FOR JOINTED DOLLS
Jacob Stein, Brooklyn, N. Y.
Application October 8, 1932, Serial No. 636,889
2 Claims. (Cl. 46—40)

1. In a joint connection for jointed hollow rubber dolls, the combination with the body and limbs of the doll, said body having concaved sockets therein and the limbs having complemental projecting end portions to fit in said sockets, said sockets each having an opening in the bottom and extending through the wall thereof and said end portions of the limbs having coaxial openings therein, of a coupling member joining said limbs and body together and comprising a shank of rubber having one end fixedly secured in an opening of one of said limbs and extending through the openings in opposite sockets and the opening in the end portion of an opposite limb, said shank being rotatable in said last mentioned opening, and an enlarged rubber head on the other end of said shank larger than said last opening, whereby the elements of the doll are movably jointed together.



2,001,335
APPARATUS FOR MARKING DIALS OF INSTRUMENTS
Adolf Urfer, Brooklyn, N. Y., assignor to Pioneer Instrument Company, Incorporated, Brooklyn, N. Y., a corporation of New York
Application April 20, 1929, Serial No. 356,691
7 Claims. (Cl. 73—151)

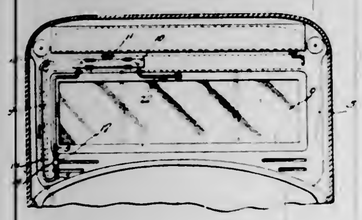
7. Apparatus for marking the dial of an indicating instrument having a hand, comprising means for subjecting said indicating instrument to a known condition which the instrument is to be adapted to subsequently indicate when unknown, and electric sparking means movable with the instrument hand for marking an indication upon the face of the dial at the will of the operator.



2,001,336
HYDRAULIC DEVICE
Paul v. Vágó and Edmond Uher, Budapest, Hungary; said Uher assignor to said von Vago
Application May 31, 1930, Serial No. 458,734
In Germany June 14, 1929
12 Claims. (Cl. 103—40)

1. A pump comprising a cylinder, a suction passage, a delivery passage, a piston reciprocating in the cylinder, a valve passage extending transversely to the direction of movement of the piston and communicating near one end with the suction passage and near the other end with the delivery passage, the central portion of the valve passage being in communication with the interior of the cylinder, a control valve reciprocating in the valve passage, the said control valve

comprising two parts, one of which controls the suction passage and the other the delivery passage, the part controlling the delivery passage being displaceable in relation to the part controlling the suction passage, and means for shifting the mean position about which the control valve reciprocates relatively to the suction and delivery passages.

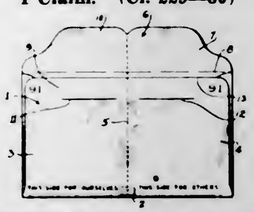


2,001,337
TRANSMISSION OPERATING AND CONTROLLING APPARATUS
Arthur A. Wiedmaier, Detroit, Mich.
Application October 23, 1931, Serial No. 570,748
10 Claims. (Cl. 74—364)

1. In an automotive vehicle having supporting propelling ground wheels, an internal combustion engine adapted to develope intake vacuum, a driving axle construction comprising an enclosing housing, power transmitting mechanism for transmitting power from the engine to the wheels through the axle construction comprising a multi-speed gear mechanism in the axle housing, a shift mechanism for the gear mechanism comprising a movable element in the axle housing, a shifting lever associated with the movable element extending outwardly through the axle housing and having an oscillatable bearing fulcrum on the housing, a vacuum actuable power-supplying means having a movable element connected to the shifting lever, and conduit means

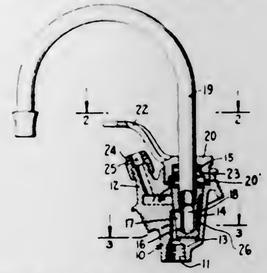
for communicating intake vacuum of the engine to the power-supplying means, and manually operable valve means in the line of the conduit means, the bearing fulcrum being formed in a lever housing having a generally tubular portion adapted to be telescoped into an aperture formed in the wall of the axle housing and to be detachably secured to the wall.

2,001,338
DEVICE FOR SPRAYING AN ANTIFREEZE SOLUTION ONTO WINDSHIELDS
John F. Wiseman, Dorchester, Mass.
Application May 13, 1932, Serial No. 611,187
2 Claims. (Cl. 20—40.5)



1. In a device for spraying an anti-freeze liquid onto the windshield of a motor vehicle, a storage tank for the liquid provided with a top filling opening and having a bottom inlet and a bottom outlet normally closed by spring-seated check valves, said check valves being arranged to be unseated by pressure to respectively admit air under pressure into the tank and to permit discharge of the liquid under pressure from said tank, means removably mounting said storage tank in the motor vehicle above said windshield, a spray head mounted at the top of and arranged to discharge the liquid onto the outer surface of the windshield, a pipe connection between the spray head and the outlet of said tank detachably coupled to the latter, and manually controlled means for supplying air under pressure to said tank including an air supply line detachably coupled to the inlet of said tank.

2,001,339
COATING PAPER
Joseph H. Wood, Chicago, Ill.
Application February 9, 1931, Serial No. 514,378
2 Claims. (Cl. 91—68)



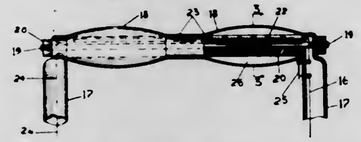
1. The method of producing coated paper which comprises; moving a web of paper; applying to said web at a predetermined point wet coating material substantially in excess of the amount finally desired; continuing the movement of the wetted web out of contact with the applying instrumentality; drawing the wetted web under its own tension over a striated calibrating and equalizing bar, to remove excess coating and calibrate the thickness of the remaining coating at all points transversely of the web by the contact between the web and the striated bar only; permitting the striated and calibrated coating to remain wet long enough for the striations to disappear; and subsequently drying the coated web.

2,001,340
ENVELOPE
Joseph W. Bear, Roanoke, and Reyborn R. Sublette, Vinton, Va., assignors to Double Envelope Corporation, Roanoke, Va., a corporation of Virginia
Application February 18, 1933, Serial No. 657,410
1 Claim. (Cl. 229—80)

Duplex envelope comprising a body having front and back faces closed at the sides and bottom and having an opening at the top, the front face having a flap foldable over said opening, said front and back faces being pasted together along a transverse strip forming side-by-side pockets, said flap and the body of the envelope having a transverse line of weakness extending intermediately along the said pasted strip, the back face of said envelope having longitudinal slits at a distance from the edge of said opening, and discontinuous over said pasted strip, said flap having a longitudinally extending gummed area at a distance from its free edge adapted to contact the back of said envelope between said slits and the edge of the opening, the free part of said flap between said gummed area and the free edge overlying said slits when said envelope is sealed.

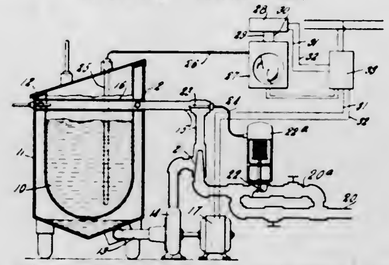
2,001,341
COMBINATION BUBBLER AND GLASS FILLER
James M. Clarke, Evansville, Ind., assignor to Servel, Inc., New York, N. Y., a corporation of Delaware
Application February 25, 1933, Serial No. 658,578
1 Claim. (Cl. 299—9)

A combination bubbler and glass filler comprising a bubbler body having an inlet, an upwardly directed bubbler discharge passage and a chamber, a hollow valve body rotatably mounted in said chamber, constructed to direct liquid flow from said inlet alternatively to said bubbler discharge passage and to the interior of said valve body, a goose neck glass filler having its inlet end secured in communication with the interior of said valve body, said valve body being provided with a chamber extending substantially around the major portion of the same and having a passage from the interior through the unchambered portion, movable upon rotation of said valve body into or out of registration with said inlet, the



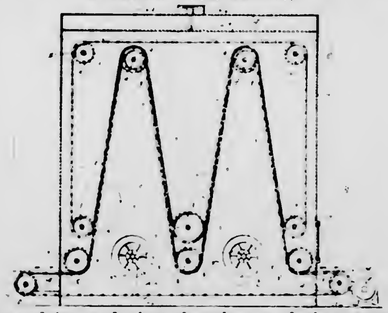
relative circumferential extent of said inlet and chamber being such that an open discharge passage through the device will be provided at all times regardless of the relative positions of the parts.

2,001,342
GOLF CLUB
Walter L. Dyce, Webster, S. Dak.
Application July 15, 1933, Serial No. 680,633
3 Claims. (Cl. 273—80)



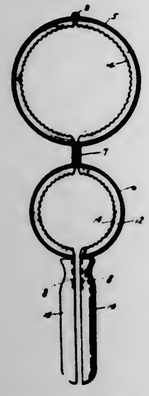
1. Means for connecting one member to another comprising a socket in one member and a reduced portion on the other member for entering the socket, the reduced portion on the said other member being provided with a spiral thread, and said socket being provided with an internal spiral thread complemental to the thread on said reduced portion for threadedly securing said reduced portion within the socket, and locking means for securing the parts together, said locking means including a sleeve slidable on said other member, a lug on said sleeve to engage alined notches provided one on the wall of the socket at the upper end of the socket, and a second notch on the reduced portion of said other member, said other member above said reduced portion being provided with a groove, a spring arranged in said groove with an end position to be engaged by the lug on the sleeve for normally urging the sleeve in one direction to retain said lug engaged with the alined notches.

2,001,343
PERAMBULATOR
Martha Fehre, New York, N. Y.
Application January 26, 1933, Serial No. 653,573
1 Claim. (Cl. 219—19)



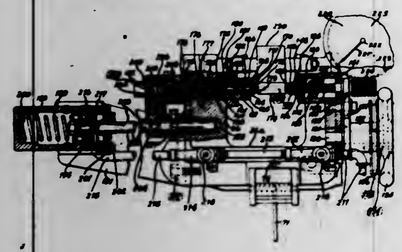
In a device of the class described, the combination of a heating unit with a carriage handle, and comprising grip elements, a rod supporting the latter, an insulator mounted on said rod and being made with two upwardly projecting flanges at its top, said flanges forming a channel between themselves and being provided with perforations in their longitudinally extending surfaces, a resistance coil disposed in said channel and serving as a positive wire, and with a negative wire co-acting with said resistance coil; the insulator being of a size relative to the gripping elements so as to form spaces therebetween adapted to co-operate with the perforations in the flanges leading to said channel for the conveyance of heat from the resistance coil, disposed in the latter, to the gripping elements, and a switch for controlling the heating element.

2,001,344
TEMPERATURE CONTROL MEANS FOR LIQUID HEATERS
Harold S. Fielder, La Grange, Ill., assignor to Cherry-Burrell Corporation, Wilmington, Del., a corporation of Delaware
Application June 29, 1933, Serial No. 678,255
19 Claims. (Cl. 236—18)



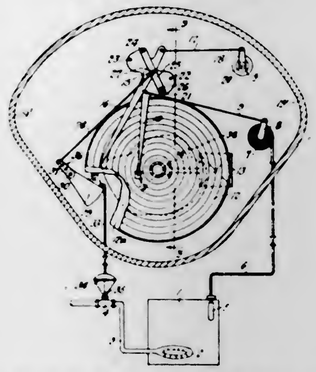
1. The combination of a vat containing a liquid, means for circulating a liquid heating medium in heat exchange relation to said liquid for heating the latter, thermo-sensitive means which regulates the temperature of the heating medium, and thermo-sensitive means which stops the circulation of the heating medium when the liquid is heated to a predetermined temperature, the stopping of the circulation of the heating medium acting indirectly through said first mentioned thermo-sensitive means to shut off the source of heat for the heating medium.

2,001,345
DRIER
Albert G. Forty, Graniteville, Mass., assignor to C. G. Sargent's Sons Corporation, Graniteville, Mass., a corporation of Massachusetts
Application January 18, 1934, Serial No. 707,184
1 Claim. (Cl. 34—12)



In a drier, a drying chamber, a chain conveyor entering the lower portion of the chamber through one end wall thereof and leaving through the lower portion of the opposite end wall, a series of sprocket wheels disposed at spaced points at the lower end of the chamber between the entrance and exit opening, a series of sprocket wheels adjacent the upper portion of the chamber, the chain conveyor being trained beneath the first named sprocket wheels and over the second named sprocket wheels to provide a series of ascending and descending flights, sprocket wheels concentric to but larger than the upper sprocket wheels, sprocket wheels disposed above but in line with the first named sprocket wheels and an endless chain conveyor travelling around the third and fourth named sprocket wheels and bearing against the material on the upper surface of the first named conveyor and travelling therewith.

2,001,346
FRUIT JAR LIFTER
Robert Jackson Hays, Kingsland, Ark.
Application May 26, 1934, Serial No. 727,831
1 Claim. (Cl. 294—28)

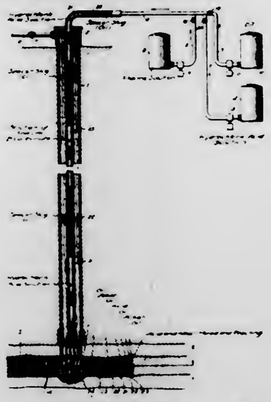


A device of the class described comprising a pair of elongated strips of considerable width, each strip having a pair of semi-circular portions, one larger than the other and a short straight portion connecting the adjacent ends of the semi-circular portions together, the large semi-circular portion terminating close to one end of the strip and the small semi-circular portion being spaced from the opposite end of the strip, said opposite end of the strip being straight, handles connected to said opposite ends of the strips and having flat inner faces and rounded outer faces, the ends of the strips opposite those ends to which the handles are connected being rolled to form barrels, and a pin passing through the barrels and hingedly connecting the two strips together, a lining of resilient material for each semi-circular portion of each strip and rivets connecting the lining to the strip, the inner end of each rivet being embedded in the lining.

2,001,347
CONDENSER WINDING MACHINE
John Q. Holmes, Anderson, Ind., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application August 16, 1933, Serial No. 685,323
12 Claims. (Cl. 242—55)

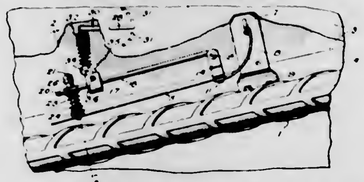
8. In a winding machine, the combination of a reciprocable mandrel for winding layers of material thereon; yielding stop means for preventing longitudinal movement of the wound object in one direction relative to the mandrel; and yielding means for moving the mandrel in either direction, the wound object being stripped off the mandrel upon engagement with said stop means during movement of the mandrel in said one direction.

2,001,348
AUTOMATIC CONTROL MECHANISM
Giles Philip Eliot Howard, Luton, England, assignor to Messrs. George Kent Limited, London, England
Application January 13, 1933, Serial No. 651,608
8 Claims. (Cl. 236—46)



1. In automatic control mechanism, the combination of a setting arm for setting the mechanism to the value at which it is desired to maintain the condition to be controlled, a second arm which is mounted to rock about an axis concentric with that of the setting arm and is displaced in dependence on the value of the condition to be controlled, a third arm pivotally connected to the setting arm and placed in connection with the second arm through a pin and slot connection a control means, a link connecting the control means to the third arm, the point of connection of the link to the third arm being co-axial with the pivotal axis of the setting and second arms when these latter are in a predetermined relative position whereby similar movement of the setting and second arms produces no relative movement of the third arm while deparature of these arms from the predetermined relative position effects movement of the third arm and hence of the control device in dependence on the extent of departure.

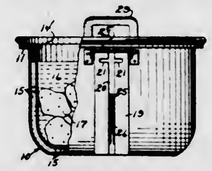
2,001,349
STEERING WHEEL AND IDENTIFICATION MEANS
Harry A. Husted, Lakewood, Ohio
Application June 22, 1934, Serial No. 731,933
7 Claims. (Cl. 40—2.2)



7. The combination with an automobile steering wheel having a metallic plastic coated spider of a metallic strip welded to the spider and provided with identification numerals or characters embossed thereon and projecting to the height of the coating of the finished wheel and whereby attempted alteration will be apparent from the resulting mutilation of the coating.

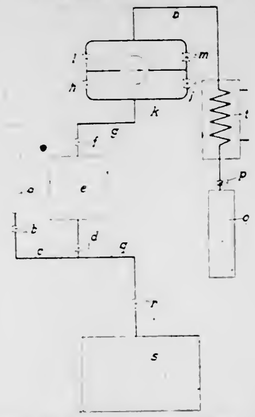
2,001,350
METHOD OF TREATING OIL AND GAS WELLS
Ronald Van Auken Mills, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Application April 20, 1934, Serial No. 721,534
1 Claim. (Cl. 166—21)

A method of chemically treating wells including the steps of injecting a chemical into the well, then injecting a charge of oil, then injecting a second chemical capable of reacting with said first chemical to produce heat and/or gas and forcing the chemicals separated by the oil into the producing formation in widening substantially concentric rings until the chemicals contact and react.



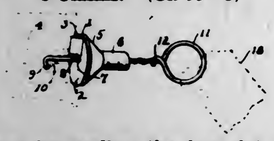
2,001,351
CORN HUSKER
Arthur Nuttelman, West Salem, Wis.
Application November 28, 1933, Serial No. 700,122
5 Claims. (Cl. 130—5)

1. In a corn husker, a bank of husking rollers, a flat plate of relatively flexible material over said rollers, a lip of stiff material extending from one end of said plate and curved upwardly, means engaged with the upper edge of the lip for pivotally supporting and vertically adjusting the same, and means for yieldably supporting the lower end portion of said plate a predetermined distance above said rollers, and means to yieldably resist movement of the plate away from said rollers.



2,001,352
COOKING UTENSIL
Emanuel Princiotta, Grosse Pointe, Mich.
Application April 21, 1934, Serial No. 721,784
2 Claims. (Cl. 53—2)

1. A cooking utensil of the kind described comprising inner and outer containers movable relative to each other and open at their tops, a mouth rim formed on the outer container and providing a seat for the open top of the inner container, said inner container having perforated sides and bottom, vertical guide housings formed on the outer container and having longitudinal and lateral slots intersecting each other,



legs on the inner container and slidably fitting the housings, and a double spring arm latch arranged in each of the legs and having latching nibs working in the longitudinal slot and receivable in the lateral slot for the latching of the containers in determined positions with respect to each other.

2,001,353
TRANSFER OF LIQUEFIED GASES
Wadim Salnikoff, Berlin, Germany, assignor to N. V. Machinerieen-en Apparaten Fabrieken "Meaf", Utrecht, Netherlands
Application April 5, 1933, Serial No. 664,673
In Germany May 12, 1932
2 Claims. (Cl. 62—178)

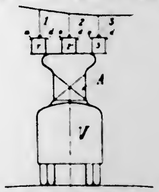
1. A plant for transferring from one vessel to another liquefied gases with exclusion of atmospheric air, such gases being intended for burning or illuminating purposes and having a comparatively high boiling point or a slight over-pressure at room temperature, the gas being stored in a liquefied state; said plant comprising, in combination with supply drum and storage vessel, a valved conduit between said supply drum and storage vessel, a second drum and a second valved conduit between said storage vessel and said second drum, a cooling device and a gas compressing pump in the second conduit, adapted to vaporize the gas and evacuate it from said storage vessel and conveying the vaporized gas to the second drum through said cooling device wherein the gas becomes reliquefied, an intermediary container inserted in the conduit between said storage vessel and the gas pump, and having connection with said first conduit.

2,001,354
LOCK SEALING MEANS
Francis Thornton Smith and Charles B. Polhemus, San Jose, Calif.
Application April 16, 1934, Serial No. 720,798
5 Claims. (Cl. 70—8)

1. Means for sealing the key slot of a lock comprising, an element formed to enter the key slot of a lock and hook upon a lock part, and a malleable material mounted upon the element and movable into engagement with the face of the lock.

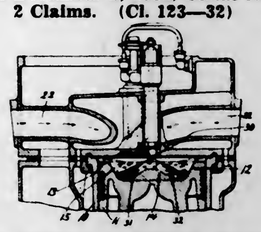
2,001,355
DIE OR ANCHOR FOR TACK BUTTONS
Franklin R. White, Waterbury, Conn., assignor to The Patent Button Company, Waterbury, Conn., a corporation of Connecticut
Application June 18, 1932, Serial No. 618,071
2 Claims. (Cl. 79—3)

1. The method of forming a die for tack buttons which consists in cutting blanks of steel ribbon stock, the forward end of the blank being the reverse of the rear end, drawing the blank into a shell having a rounded bottom and serrated rim, and the serrations being of varying lengths due to the shape of the cut blank, compressing the dome of the shell to form a head, drawing in the remainder of the shell to form a restricted hub, and forcing the uneven length serrations up into the hub to provide a guide for a tack.



2,001,356
HINGE
Fred G. Bates, Highland Park, Mich.
Application April 4, 1934, Serial No. 718,956
6 Claims. (Cl. 16—164)

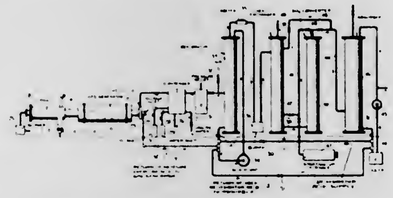
1. A hinge comprising two apertured plates, a curved arm pivoted in each plate, both arms being of similar radius for a greater portion of their length and being aligned with one another for a portion of their length in all positions of the hinge, means extending from each arm slidable in a slot formed in the other arm, and guide means carried by the plates each controlling the path of movement of one of the arms.



2,001,357
ELECTRIC TRACTION
Edouard Guignard, Paris, France, assignor to Société Parisienne pour l'Industrie des Chemins de Fer et des Tramways Electriques, Paris, France, a French joint-stock company
Application July 27, 1933, Serial No. 682,515
In France August 10, 1932
8 Claims. (Cl. 191—33)

1. A trolley-wire system for collector-fitted electric traction vehicles having an indefinite path, comprising a plurality of parallel wires including conductors connected to respective poles of a source of supply, and dead wires spaced intermediately between and laterally of said conductors, said dead wires being spaced

from the adjacent conductors and from each other a distance less than the width of the collector adapted to take current from each conductor, and said wires constituting a substantially horizontal web extending in the direction of travel.

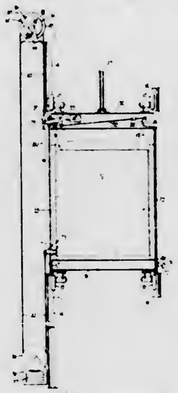


2,001,358
INTERNAL COMBUSTION ENGINE
Charles O. Guernsey, Yeadon, Pa., assignor to American Car and Foundry Motors Company, New York, N. Y., a corporation of Delaware
Application December 2, 1931, Serial No. 578,501
2 Claims. (Cl. 123—32)

1. In an internal combustion engine of the Diesel type, the combination of a piston the head of which is formed with an annular cavity to accomodate a fuel ring, the cavity being defined internally by a central cone, the outer wall of the cavity being inclined to terminate short of the cylinder wall whereby a ring-like shelf is provided at the edge of the piston to cause preliminary accelerated pressure inwardly across the annular cavity upon upward movement of the piston whereby rotation of the mass in the annular cavity towards a common axis is produced, a plurality of inlets arranged to direct air tangentially at spaced points to cause rotation of the mass in said fuel ring about a common axis, and a fuel inlet positioned over the cone-shaped piston extension having ports arranged to direct oil into the annular cavity and transversely of the fuel ring towards its inclined outer wall.

2,001,359
PROCESS OF MAKING CONCENTRATED SULPHURIC ACID OR OLEUM
Ingenuin Hechenbleikner, Charlotte, N. C., assignor to Chemical Construction Corporation, Charlotte, N. C., a corporation of Delaware
Application November 11, 1931, Serial No. 574,244
5 Claims. (Cl. 23—175)

1. In the process of making a highly concentrated sulphuric acid or oleum from a moisture loaded sulphur dioxide gas in a system wherein a moisture loaded SO_2 gas is produced in a gas generator, by the reduction of SO_4 compounds with an excess of reducing agent, is subsequently passed through a water condenser, wherein moisture is removed from the gas, and the gas exiting from the condenser and containing an overload of moisture is then passed through a sulphuric acid dehydrator, wherein the moisture overload is taken up by the sulphuric acid therein, the steps which comprise returning the acid containing the moisture overload to the contents of the gas generator, regenerating SO_2 gas therefrom in said gas generator, passing the regenerated SO_2 gas through the water condenser and withdrawing the moisture overload from the system by means of the condenser.

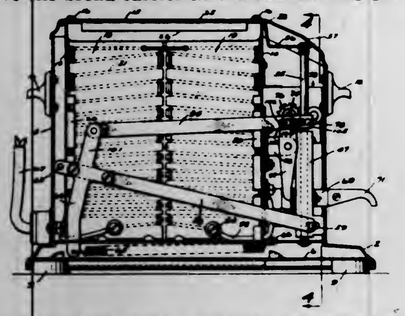


3. The process of making highly concentrated sulphuric acid or oleum which comprises generating at one point in a sulphuric acid system a moisture laden sulphur dioxide gas by the reduction of SO_4 compounds, including a portion of the acid produced in the system, in the presence of an excess reducing agent, passing the gas through a condenser maintained at a temperature below the boiling point of water, passing the gases from the condenser, admixed with sufficient oxygen-containing gas for the contact sulphuric acid process, through a dehydrator irrigated with strong sulphuric acid produced in the system, passing the dehydrated SO_2 gas through a contact sulphuric acid process, absorbing the SO_3 produced in sulphuric acid fed by a portion of the dehydrator acid, and passing sufficient of the dehydrator acid to the point in the system where the SO_4 compounds are being reduced so that all the water will be liberated and removed by the condenser over and above that required in the absorber to produce a product acid of the desired strength.

2,001,360
TRASH BURNER
Howard H. Heuston, Boulder, Colo.
Application September 8, 1931, Serial No. 561,620
2 Claims. (Cl. 110—17)

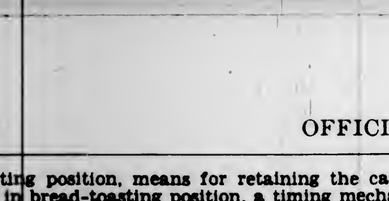
1. A trash burner comprising, in combination, an ash pit having a top opening therein, a sleeve depending from said opening, and a container within the sleeve depending from the sleeve, the sleeve and container having alined openings for the deposit of non-combustible rubbish into the ash pit without removing the container.

2,001,361
ELEVATOR SAFETY APPARATUS
Frederick Hymans, Larchmont, N. Y., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application November 21, 1934, Serial No. 754,011
11 Claims. (Cl. 187—80)



1. Elevator safety equipment for a movable body in the hatchway of an elevator installation, comprising; mechanism, including a safety brake on said body, for stopping said body under emergency conditions, said mechanism also including an actuating device on said body movable from its normal, non-safety-applying position to a position causing application of said safety brake; a sheave mounted at the top of said hatchway; a loop of rope extending throughout the height of said hatchway and closed upon said body, the upper bight of said loop of rope passing over said sheave with the end of the rope in the upper bight operatively connected to said actuating device, and with the end of the rope in the lower bight secured to said body; a second sheave mounted at the bottom of said hatchway and around which the lower bight of said loop of rope passes; means maintaining said rope in tension; and weighted means on said body connected to the end of said rope in the upper bight so that at least a portion of the weight of said weighted means is supported by said rope, the balance of the weight of said weighted means being supported by said body and serving to maintain said weighted means and the end of said rope in the upper bight in fixed relation to said body during normal service conditions of operation of said movable body, said weighted means, upon abnormal downward acceleration of said movable body, moving downwardly at an acceleration less than that of said movable body so that the end of said rope in the upper bight moves upwardly relative to said body thereby to move said actuating device from its non-safety-applying position to its position causing application of said safety brake.

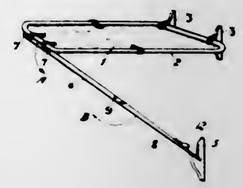
2,001,362
TOASTER
Murray Ireland, Minneapolis, Minn., assignor to Waters-Genter Company, Minneapolis, Minn., a corporation of Minnesota
Application March 19, 1930, Serial No. 437,071
17 Claims. (Cl. 219—19)



1. A toaster including a movable bread carrier, means normally urging said carrier into non-

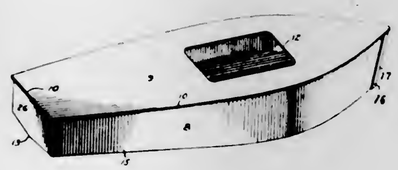
toasting position, means for retaining the carrier in bread-toasting position, a timing mechanism automatically operable to actuate said retaining means after a predetermined toasting interval to permit the bread carrier to move to non-toasting position, an operating member adapted upon movement in one direction to move the bread carrier into bread-toasting posi-

tion and render said mechanism operative, and means made operable by reverse movement of said member independently of said timing mechanism and said bread carrier, to thereby render said retaining means inoperative, whereby the bread carrier is returned to non-toasting position independently of said timing mechanism.



2,001,363
FLASH LIGHT
Carl F. Joers, Los Angeles, Calif.
Application May 22, 1933, Serial No. 672,262
3 Claims. (Cl. 240—10.66)

1. A flash-light including a hollow cylindrical rubber body having an open and a closed end, a segmental terminal partly imbedded in said body adjacent its open end, a battery in said body, a lamp frame having an annular rim in contact with said terminal, a lamp in said frame, a metal casing on the exterior of said body that has its edge portion embedded therein, a metal strip connecting said segmental terminal with a terminal within said casing, another metal strip connecting said casing with an end of said battery to complete an electrical circuit through said lamp, and a push button slide in said casing for opening and closing the circuit through said lamp, said flash-light constructed so that the longitudinal and radial tension of said body holds the interior parts together.

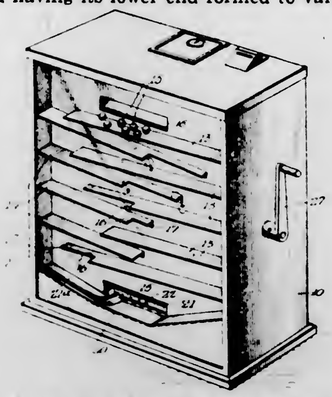


2,001,364
FOLDING SUPPORT FOR FOLDING TABLES
Herman Larsson, Hedemora, Sweden
Application September 25, 1933, Serial No. 690,904
In Sweden February 16, 1933
1 Claim. (Cl. 311—19)

A foldable support for folding tables comprising in combination a frame, two holding devices hingedly connected at one side of said frame and adapted to be attached to a wall, two stays hingedly connected at one end one near each corner of the side of said frame opposite said holding devices, said stays converging towards the other ends, a central stay hingedly connected

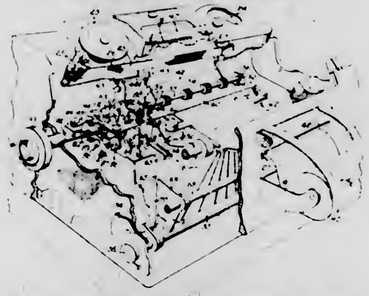
at one end to the convergent ends of said first mentioned stays, a fork on the other end of said last mentioned central stay and a support adapted to be fixed on the wall below and in a plane intermediate of said holding devices to engage said fork to maintain the frame in the horizontal position.

2,001,365
MINIATURE OR TOY BOAT
Frank L. Lindstrom, Bridgeport, Conn.
Application December 13, 1933, Serial No. 702,219
1 Claim. (Cl. 9—6)



A toy boat comprising a hull made of a single sheet metal blank bent to form a relatively flat bottom, a bow, stern and sides, the top edges of the said sides and back being disposed out at substantially a right angle, and a sheet metal deck attached to the hull by having its edges turned down under and swedged to the angularly disposed edges of the sides and back, the stern having a back formed at a right angle to the sides and bottom and having corner portions that are formed by folding in the corner portions of the sheet metal blank from which the hull is formed, and disposed flat against the inner wall of the stern portion of the boat.

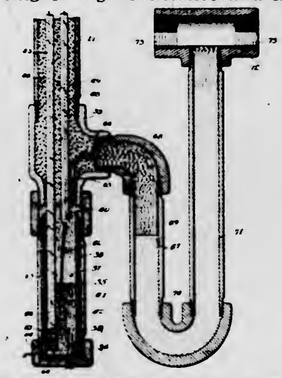
2,001,366
GAME
Benjamin E. Mittelman, Chicago, Ill.
Application February 23, 1933, Serial No. 657,955
8 Claims. (Cl. 273—144)



1. In a game, the combination of a case, a series of rolling tokens, a series of downwardly inclined runways arranged successively to receive the tokens from one another, one of the runways being wider than the tokens to permit them

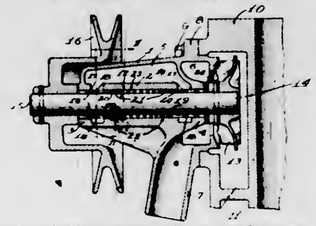
to assume different transverse positions thereon, and having its lower end formed to vary the

length of the run of the tokens thereon when they run on different transverse portions.



2,001,367
TALLY ROLL MECHANISM
Robert L. Muller, Detroit, Mich., assignor to Burroughs Adding Machine Company, Detroit, Mich., a corporation of Michigan
Application September 23, 1931, Serial No. 564,570
20 Claims. (Cl. 235—58)

1. A calculating machine having a platen, a printing mechanism, means for supporting and guiding a tally strip between said platen and printing mechanism, tally strip feed rolls normally separated from said tally strip so as to enable said tally strip to be freely moved relative to said rolls, and means acting automatically during operation of said calculating machine to cause said tally strip feed rolls to momentarily engage said tally strip and move it, said rolls returning to separated position as the operation of said machine is completed.



2,001,368
FLUID PRESSURE INDICATOR
Clifford Older, Wilmette, Ill.
Application May 10, 1930, Serial No. 451,502
1 Claim. (Cl. 201—55)

In a fluid depth indicator, a housing made of standard pipe fittings comprising a first pipe fitting with a T fitting, said T fitting being joined by a nipple to a second lower pipe having a lower cap and forming a reservoir, an elbow joined to said T fitting and extending downwardly, a downwardly extending pipe carried by said elbow, a U fitting secured thereto and an upwardly extending pipe secured to said U fitting, a pair of electrodes mounted in the first-mentioned pipe and secured by a cementitious filling therein, a body of mercury in said reservoir, said reservoir having an insulating lining, one of said electrodes being enclosed in an insulating tube, and the other of said electrodes being exposed in said mercury, one of said electrodes being of high resistance and immersible

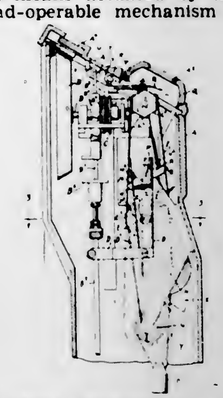
in the mercury at depths varying in accordance with the pressure of the liquid the depth of which is to be indicated, resilient means for drawing both of said electrodes taut, a fluid lighter than the liquid of which depth is to be indicated filling said reservoir and extending over into said elbow and the pipe depending therefrom, the balance of said pipes, extending downward and upward, being filled with the fluid the depth of which is to be indicated.

2,001,369
CIRCULATING PUMP
Carl A. Ruesenberg, Rockford, Ill., assignor, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application May 4, 1931, Serial No. 534,803
10 Claims. (Cl. 103—111)

1. A circulating pump in a cooling water system, said pump comprising a casing with cylindrical end sections, a shaft housing spaced from and aligned with said end sections, bushings in said end sections and bridging the spaces between the same and said housing, a compressed spring in said housing, packing means in said housing between the spring and said bushings, means for retaining said bushings in said sections, a shaft in said sections and housing and journaled in said bushings whereby said casing is rendered substantially fluid-tight, a semi-solid lubricant carried in said casing, and means for feeding said lubricant to the journaled portions of the shaft in proportion to the requirements of said portions.

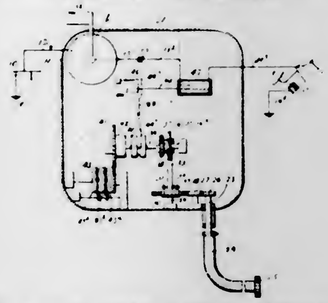
2,001,370
STOCKING TOE
Robert B. Schindler, Spring City, Pa.
Application May 13, 1933, Serial No. 670,839
2 Claims. (Cl. 66—187)

1. A stocking consisting of a knitted welt section, a knitted leg section and a knitted toe section, the toe section including a plain solid knit toe patch and an open work panel in the top of the toe section directly behind said toe patch, said panel consisting of a plurality of transferred loops forming openings in the panel and giving increased elasticity thereto and a pair of non-run courses extending along the coursewise edges of said panel and including spread loops each interlocking with a pair of knitted wales.



2,001,371
CONFECTION
Rudolph G. Thoke, La Grange, Ill., assignor to Hydrox Corporation, Chicago, Ill., a corporation of Delaware
Application March 28, 1933, Serial No. 663,152
7 Claims. (Cl. 99—16)

1. As a new article of manufacture and in combination, a cone formed of edible frangible material, an auxiliary frusto-conical separate member formed of infrangible and inedible sheet material arranged adjacent the upper portion of said cone with one edge contacting closely therewith, so as to define an inverted frusto-conical space in prolongation of the space within said cone, and a frozen comestible substantially filling said cone and said member, said comestible having been solidified therein.



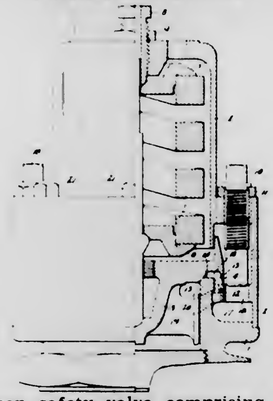
2,001,372
DISPLAY APPURTENANCE TO WEIGHING MECHANISM
Hughes C. Turner, New York, N. Y., and Howard Roy Stacks, Detroit, Mich.; said Stacks assignor to said Turner
Application October 14, 1933, Serial No. 693,620
4 Claims. (Cl. 40—28)

1. In combination with a load-operable mechanism, means for effecting the successive display of a variety of prepared messages synchronously with the operation thereof, comprising a pair of storage drums, a message-bearing strip adapted to be unwound from one of said drums as it is rolled upon the other of said drums, a display drum over which the intermediate portion of said strip passes on its way from one to the other of said drums, said display drum being positioned observedly adjacent a selected point relatively to the probable location of the user's eye, means actuated by the movement of the load-operable mechanism whereby the

movement of the strip through a predetermined distance along its length is contemporaneously effected, and means rendered active by the engagement thereagainst of selectively located projecting appurtenances upon the strip whereby a reversal in the direction of movement of the latter is automatically effected.

2,001,373
REGISTERING MEANS FOR TAXIMETERS
Abraham Weiss, New York, N. Y., assignor to Edward Weiss, New York, N. Y.
Application December 17, 1930, Serial No. 502,950
2 Claims. (Cl. 235—30)

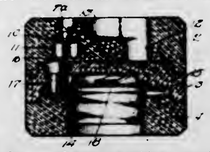
2. In a motor vehicle having a passenger compartment, an accelerator pedal, a flag controlled taximeter, a source of electric power whose circuit includes a switch operated by the flag of said taximeter and adapted to be closed when said flag is in non-registering position, a second switch adapted to be closed when said passenger compartment is occupied and a third switch adapted to be closed by the depression of said accelerator pedal, mileage registering means adapted to be operated from a rotatable part of said vehicle, means for controlling the operation of said registering means including two elements displaceable relative to one another and of which one is operatively connected to said registering means, rocking means coupled to the other of said elements and electro-magnetic means controlled from said electric source and adapted to



be energized when said first two named switches are closed and to actuate said rocking element so as to engage said two elements with one another to render said registering means operative.

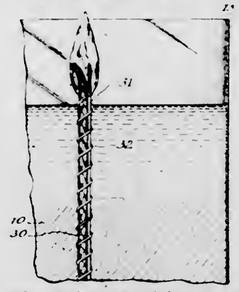
2,001,374
THREAD GUIDE FOR WINDING MACHINES
Abraham Amel, Pawtucket, R. I.
Application September 20, 1933, Serial No. 690,189
2 Claims. (Cl. 242—157)

1. A thread guiding means for winding machines comprising a body having upstanding portions spaced from each other and provided with aligned recesses for the reception of a shaft member, a circumferentially grooved guide pulley located between said upstanding portions, a shaft member located within the aligned recesses and rotatably supporting said guide pulley, and resilient means carried by said shaft for frictionally engaging a portion of said body to hold the shaft against accidental separation from the body.



2,001,375
POP SAFETY VALVE
Harry S. Baker, Arlington, Mass., assignor to The Ashton Valve Company, Cambridge, Mass., a corporation of Massachusetts
Application October 22, 1930, Serial No. 490,510
5 Claims. (Cl. 137—53)

5. A pop safety valve comprising an upper seat; a base; a lower seat on said base and engaging said upper seat; a head bolted to said base; and pop regulators and seats therefor carried by said head, the last-mentioned seats being integral with said head.

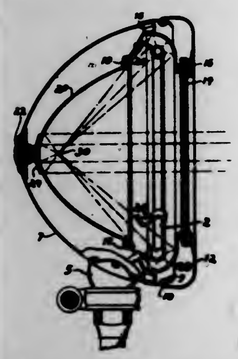


2,001,376
SERIES SOCKET WITH RENEWABLE ELEMENTS
Reuben B. Benjamin, Chicago, Ill., assignor to Benjamin Electric Manufacturing Company, Des Plaines, Ill., a corporation of Illinois
Application April 14, 1930, Serial No. 443,937
5 Claims. (Cl. 173—344)

1. A high voltage series socket construction comprising a three-part insulating base including upper, intermediate and lower coaxial cylindrical portions, anchorage nuts, two wiring terminals and two blade-engaging contacts all mounted on the upper base portion, said wiring terminals being accessible for wiring from the lower side of said base portion, a shell contact, a center contact and two contact-engaging blades all mounted on the intermediate base portion, the lower base portion having a central recess to receive the shell contact, and screws spaced about the shell contact and extending

through the lower base portion and intermediate base portion and threaded into said anchorage nuts for securing the lower base portion and the intermediate base portion and the parts carried thereby to the upper base portion, said screws being accessible for operation from the lower side of the lower base portion and said center contact and its corresponding blade having juxtaposed base portions and a screw extending through said intermediate base portion and the base portion of the center contact and threaded into the base portion of the blade.

2,001,377
CANDLE WICK
Albert T. Candy, Jr., Oak Park, Ill., assignor to Candy & Company, Inc., Chicago, Ill., a corporation of Illinois
Application February 5, 1934, Serial No. 709,721
10 Claims. (Cl. 67—22)



1. A candle wick comprising a self-consuming fabric wick, a reinforcing strip extending thereabout externally thereof, and a fine wire, fusible at the temperature at the base of the flame, openly wrapped about the fabric wick and strip for holding them together.

2,001,378
AUTOMOBILE HEADLIGHT
James E. Cornwall, Detroit, Mich.
Application November 9, 1933, Serial No. 697,251
2 Claims. (Cl. 240—41.1)

1. An illuminating device comprising a dished exterior casing having an open mouth and a substantially parabolic reflector therein, and axially movable within the casing and having its free edge terminating short of the mouth of the casing, means for moving the parabolic reflector axially, an annular supporting member arranged within and substantially at the mouth of the casing, a bearing portion carried by said

supporting portion and slidably supporting and interfitting with the free edge of the parabolic reflector, a substantially annular luminable tube carried by said supporting member adjacent the free edge of said reflector, another reflector of generally partly toroidal form carried by and interfitting with the opposite end of said supporting member and projecting between the tube and open mouth of the casing, said last mentioned reflector being so disposed as to cast light from the tube toward the focal point of the parabolic reflector, and the latter being arranged to throw such light out the open mouth of the casing, a transparent plate tightly connected to said partly toroidal reflector and to the casing and completing separate enclosure of the space within said reflectors and supporting member and also closing the open mouth of the exterior casing.

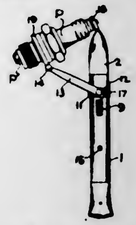
2,001,379
SERIES SOCKET WITH REMOVABLE ELEMENTS
Raymond W. Corwin, Haddonfield, N. J., assignor to Benjamin Electric Manufacturing Company, Des Plaines, Ill., a corporation of Illinois
Application May 5, 1930, Serial No. 449,781
5 Claims. (Cl. 173—344)

1. An electric lighting fixture comprising three sections with one section lying between the other two, wiring terminals attached to one of the outer sections and connected to spring contacts carried in said outer section, a center contact attached to the inner section and a shell contact adapted to receive a lamp, attached to the other outer section, contact blades secured to the center and shell contacts for engaging with said spring contacts, said contact blade secured to said shell contact passing through an opening in said inner section whereby said outer section carrying said shell contact and contact blade secured thereto may be detached from said socket without affecting the other two sections, and means for fastening the three sections together.

2,001,380
SALTS OF KETO AROMATIC ACIDS
Lloyd C. Daniels, Crafton, and Alphons O. Jaeger, Mount Lebanon, Pa., assignors, by mesne assignments, to American Cyanamid & Chemical Corporation, a corporation of Delaware
No Drawing. Application December 9, 1930, Serial No. 501,073
1 Claim. (Cl. 260—11)

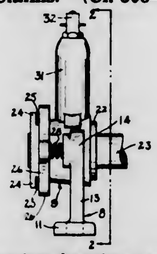
Salts of ketoaromatic acids having the formula

$$(R—CO—R'COO)_yM$$



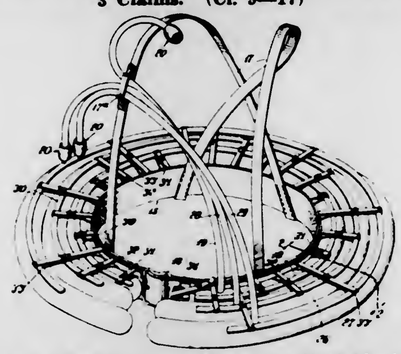
in which R is an aromatic and R' is an aliphatic radical, and M is any salt-forming metal having a valence of 3 or higher, and y is a number corresponding to the valence of the metal.

2,001,381
CONSTRUCTION OF RUGS OF PILE FABRICS
Charles Herbert Davison, Princeton, N. J.
Application August 29, 1934, Serial No. 741,978
7 Claims. (Cl. 28—1)



1. The method of forming rugs of Axminister pile fabric which consists in weaving said fabric with successive areas thereof provided with pile, and with spaces between said areas devoid of pile; the adjoining areas being connected solely by binding warps; severing said fabric intermediate of said spaces devoid of pile; bending back the severed ends of the binding elements upon the back of the fabric opposite to the pile and securing said ends by elastic adhesive so that the end wefts of the fabric are thus bound in the fabric; and covering said bent back ends with a flat band of tough material extending along said edge coextensive with the bights of the bent back binding warps and secured by said adhesive.

2,001,382
TESTING IMPLEMENT FOR SPARK PLUGS AND IGNITION
Harold J. Faltico, Spokane, Wash.
Application April 27, 1934, Serial No. 722,674
2 Claims. (Cl. 175—183)



1. In a spark-plug testing implement, the combination with a holder having a contact-cap mounted thereon, of an exterior gap-band mounted on the holder and having a gap-point adjacent the cap, a foldable conductor arm of resilient material pivotally mounted on said band, said holder having an exterior socket, and a head on the free end of the arm adapted to engage in said socket when the arm is in active position.

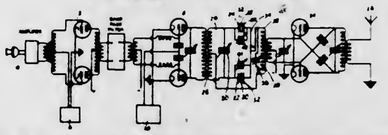
2,001,383
SELF-ALIGNING BEARING
Edward A. Freed, Moline, Ill.
Application June 2, 1934, Serial No. 728,742
5 Claims. (Cl. 308—72)

1. A self aligning bearing comprising a supporting bracket, a yoke formed on said bracket, a beveled surface around the edge of said yoke on one face thereof, a tapered bearing sleeve supported in said yoke and engaging said beveled surface, and resilient connecting means between said sleeve and said yoke, whereby said sleeve is held in yielding engagement with said yoke in any position in which said sleeve is adjusted relative to said yoke.

2,001,384
PNEUMATIC LIFE BELT
James D. Garvey, Chicago, Ill.
Application December 24, 1932, Serial No. 648,788
3 Claims. (Cl. 9—17)

1. A life belt comprising an adjustable belt adapted to fit about the waist of the user; an elongated inflatable tube disposed about said belt and provided with an inflating tube; means for reducing the length of said inflatable tube in keeping with the adjustment of said belt consisting of a disc provided with an opening having a beaded perimeter for passage of the end of said tube therethrough before inflation and lacing secured to said disc adapted to receive the folded non-inflated end of the tube therebeneath; and means whereby said tube is secured to said belt.

2,001,385
ELECTROLYTIC DEPOSITION OF NICKEL FROM NICKEL SALT SOLUTIONS
Anton Martin Grönningsæter, New York, N. Y., assignor to Falconbridge Nickel Mines Limited, Toronto, Ontario, Canada
No Drawing. Application August 15, 1933, Serial No. 685,224. In Norway August 27, 1932
3 Claims. (Cl. 204—14)

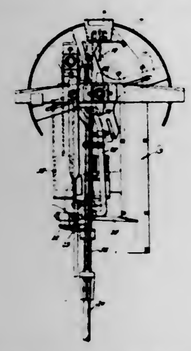


1. In the electrolytic refining of nickel when using deposition of nickel on nickel starting sheets, the method which consists in subjecting the starting sheets prior to being introduced into the electrodeposition cell to the action of dilute acid of sufficient strength to effect dissolution of basic nickel compounds on the surface of the sheets but so dilute as not to attack to any appreciable extent the metallic nickel even when left in contact with the metal for several hours.

2,001,386
CARRIER FOR LAUNDRY ASSORTING MACHINES
Angus F. Hanney, Norwood, Ohio, assignor to The American Laundry Machinery Company, Cincinnati, Ohio, a corporation of Ohio
Application November 3, 1932, Serial No. 641,110
6 Claims. (Cl. 105—154)

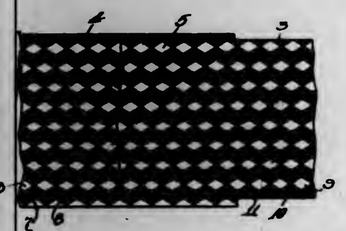
1. A carrier for the purpose described comprising a rail-receiving part of U-form with rail-engaging lugs inwardly extending from the ends of the U side members, and a box part at the base of the U with an open end and a downwardly-opening slot leading therefrom, to receive and retain a laundry identification clip.

2,001,387
FILTER
Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application September 24, 1931, Serial No. 564,770
6 Claims. (Cl. 178—44)



3. A band pass filter arrangement comprising a pair of systems each having the resonant characteristic of a tuned electrical circuit, the systems being so dimensioned that their resonant characteristics overlap, a connection having appreciable impedance connected between two ends of said systems, a low impedance connection connecting together the other two ends of said systems, and an alternating current circuit connected between an intermediate point on said connection having appreciable impedance and a point on said low impedance connection, said arrangement passing electrical currents of substantially equal intensity throughout the range of frequencies including and between the resonant frequencies of said systems.

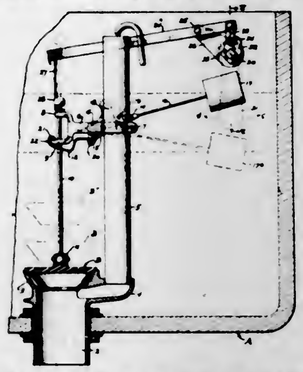
2,001,388
COIN OPERATED WEIGHING SCALE
Leonard O. Kelley, Detroit, Mich., assignor to The Standard Computing Scale Company, Detroit, Mich., a corporation of Michigan
Application April 22, 1932, Serial No. 606,863
7 Claims. (Cl. 194—35)



1. Safeguarding means for use in conjunction with a weighing scale provided with load counterbalancing means, weight indicating means and a

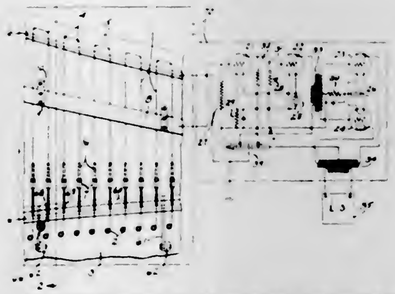
connecting rod assembly formed in a plurality of separable sections, in which said rod assembly extends between said means and is adapted to act in tension to operate the weight indicating means, a latch member for securing certain of the sections together to enable transmission of

tensile stress therethrough, means for releasing the latch member to destroy the effectiveness of said rod assembly in tension, and means including a cam for forcing certain sections together and into latching position upon movement of the assembly in one direction.



2,001,389
PROCESS OF MAKING TRANSPARENT FILM MATERIAL
Edouard M. Kratz, Gary, Ind., assignor, by mesne assignments, to Marbo Products Corporation, Chicago, Ill., a corporation of Delaware
Application May 14, 1932, Serial No. 611,329
6 Claims. (Cl. 18—57)

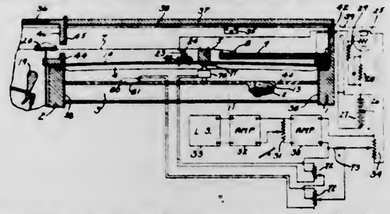
1. The method of forming sheet material having an ornamental design, which comprises printing upon a smooth surface by an offset process to form designed portions of a different finish from the original finish of said surface without indenting said surface; coating a solution capable of forming a sheet material upon said surface, and stripping the resulting sheet material off of said surface with said designed portions reproduced on said sheet material, the finish remaining on said smooth surface after the stripping step.



2,001,390
FLUSHING VALVE MECHANISM
Warren A. Lester, Oakland, Calif.
Application July 7, 1934, Serial No. 734,176
5 Claims. (Cl. 4—67)

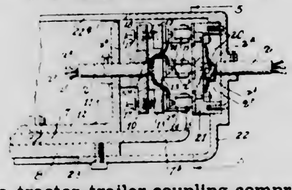
1. In combination with a flush valve having a stem and a bracket to receive and guide said stem, a pivoted clutch member having a hole formed therein and embracing the stem in a manner to

retain the valve in a partially opened position, and means to release said clutch member.



2,001,391
APPARATUS FOR THE PRODUCTION OF MUSIC
Benjamin F. Miessner, Millburn Township, Essex County, N. J., assignor to Miessner Inventions, Inc., a corporation of New Jersey
Original application May 4, 1931, Serial No. 534,849. Divided and this application November 4, 1932, Serial No. 641,161
3 Claims. (Cl. 84—1)

1. In combination in a musical instrument, a plurality of tuned vibrators; selectively operable impulse exciting means therefor; a mechanico-electro-acoustic translating system for translating from said vibrators substantially the entire output sound of said instrument, said system having portions in spaced relationship to said vibrators and operating in accordance with vibratory variation of such spaced relationship, whereby said vibrators are substantially isolated from acoustic impedance; and mechanical impedance means coupled to said vibrators for reflecting thereinto mechanical impedances to simulate reflected acoustic impedance.



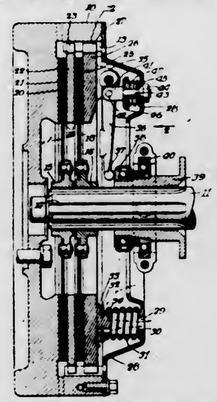
2,001,392
METHOD AND APPARATUS FOR THE PRODUCTION OF MUSIC
Benjamin F. Miessner, Millburn Township, Essex County, N. J., assignor to Miessner Inventions, Inc., a corporation of New Jersey
Application December 14, 1932, Serial No. 647,154
10 Claims. (Cl. 84—1)

1. The combination with a musical instrument including a plurality of tuned vibrators and a resonator coupled thereto and adapted to radiate sound in accordance with their vibrations, of means for producing electric oscillations in accordance with said vibrations; an electro-acoustic system for amplifying said oscillations and translating the same into sound, said system including and terminating in a diaphragm directly coupled to air external of said instrument; and a plurality of selectively adjustable control means

associated with said instrument and electro-acoustic system, whereby a variety of qualitatively different sounds may be produced at will, said control means comprising means included in said electro-acoustic system for varying the amplitude of said oscillations, and means borne by said instrument for varying the efficiency or radiation from said resonator.

2,001,393
ELECTRICAL CONTACT FOR ARTICULATED VEHICLES
Anthony W. Molinare, Forest Park, Ill., assignor to Highway Trailer Company, Edgerton, Wis., a corporation of Wisconsin
Original application October 28, 1931, Serial No. 571,524. Divided and this application October 30, 1933, Serial No. 695,838
5 Claims. (Cl. 280—33.1)

1. In a tractor-trailer coupling comprising upper and lower fifth wheel parts adapted to be coupled and uncoupled by relative horizontal movement, electrical connector means comprising an arcuate contact member carried by one of said fifth wheel parts outside the area of their bearing contact and above the plane of such bearing contact, and a cooperating contact member carried by the other fifth wheel part, said contact members having substantially vertical surfaces which are brought into abutting engagement by movement of the fifth wheel parts into their coupled pivotal relation, the arcuate form of the one contact being concentric with the axis of said pivotal relation.

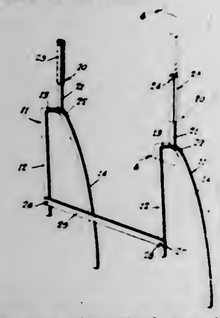


2,001,394
FIRE EXTINGUISHER
Carl A. Norgren, Denver, Colo.
Application October 26, 1931, Serial No. 571,137
10 Claims. (Cl. 169—31)

8. In a fire extinguisher, a container having a discharge nozzle, a casing having a rupturable wall portion within the container, manually operable means for opening communication between the container and the casing through said rupturable wall portion, and a spring plate releasably engaged with the manually operable means and with the nozzle to effect closure of the same, said spring plate and said manually operable means being arranged to effect release of the spring plate from said manually operable means and from said

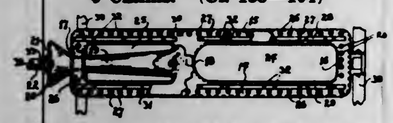
nozzle upon opening of the casing by movement of said manually operable means.

2,001,395
CLUTCH
William J. Pearmain, Racine, Wis., assignor to Twin Disc Clutch Company, Racine, Wis., a corporation of Wisconsin
Application February 17, 1932, Serial No. 593,444
9 Claims. (Cl. 192—69)



1. In a clutch, the combination with a friction plate attachable to a rotary part, a pair of gripping members connectible to a second rotary part and disposed on opposite sides of said plate, one of said members constituting a floating plate movable axially relative to the other member, and springs for maintaining the driving engagement of said members and friction plate, of unloading mechanism for releasing said engagement comprising levers rockably mounted on said floating plate, a cover plate secured to said other gripping member, fulcrum rods rockably mounted at one end on said cover plate and connected at the other end to said levers, and means for operating said levers.

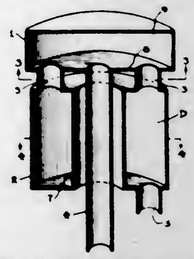
2,001,396
HEADREST FOR MOTOR VEHICLES
Harry E. Pumphrey, Pasadena, Calif.
Application July 13, 1934, Serial No. 734,934
3 Claims. (Cl. 155—174)



1. In a device as described, a pair of clamps each having a rear and a front strap connected

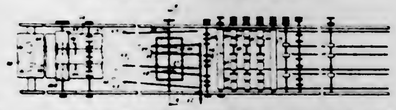
by a top piece, said straps being resilient and tensioned to resist spreading, said straps being adapted to engage the rear and front face, and the top edge of a seat back, a spacing means for the clamp, each clamp having a vertical post adjacent its top, and a headrest device secured to each post, each post having a lower section and an upper section U-shaped in cross section pivoted to the upper end of the lower section, the U-shaped section being adapted to encase part of the lower section or to be turned upwardly into alignment therewith.

2. In a device as described, a sack having front, back and end walls, and a bottom, and open at the top, vertical pockets at the ends, and means fitting in said pockets adapted to secure the sack on a seat back with the bottom resting on the upper edge of the seat back.



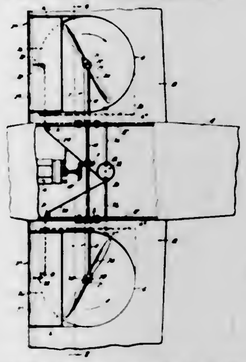
2,001,397
BURNER FOR GAS HEATED RADIATORS
William T. Rasch, New York, N. Y., assignor to American Gas Products Corporation, New York, N. Y., a corporation of New York
Application September 9, 1930, Serial No. 480,764
5 Claims. (Cl. 158—104)

1. A burner for gas heated radiators, embodying therein means forming a looped mixing chamber having nipples projecting from the top thereof along one edge of the opposite sides and the opposite ends thereof, said nipples having burner openings therethrough, a distributing chamber communicating with opposite sides of said mixing chamber between and remote from the ends thereof, hollow ribs projecting from the top of opposite sides of said mixing chamber adjacent said nipples and extending from points adjacent said distributing chamber to adjacent the opposite ends of said mixing chamber, said ribs having openings therethrough remote from said distributing chamber, and a mixing tube discharging into said distributing chamber, an air shutter mounted adjacent the mouth of said mixing tube and a fitting carrying a jet nozzle projecting from said air shutter and discharging into said tube.



2,001,398
AIR DEFLECTOR AND WATER CIRCULATOR
Alfred W. Ravening, West Springfield, Mass.
Application April 4, 1933, Serial No. 664,406
5 Claims. (Cl. 122—4)

3. A combined air deflector and water circulator comprising an annular lower water compartment having an air passage therethrough, an upper water compartment spaced a short distance above the lower compartment and disposed over

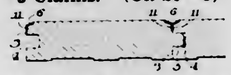


the air passage of the lower compartment to deflect up coming air radially, and water columns connecting the upper and lower compartments.

2,001,399
MACHINE FOR MAKING SHINGLES
John Andrew Scharwath, Jersey City, N. J.
Application December 10, 1932, Serial No. 646,608
19 Claims. (Cl. 91—15)

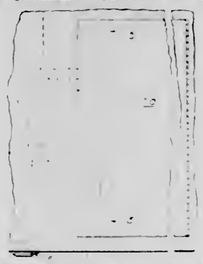
5. An apparatus for making shingles which comprises means for heating the shingle material along a line, means for applying adhesive, a plurality of pairs of rolls, one of each pair having a flange and the other having a conical surface, and a folding plate interposed between adjacent pairs of rolls, said rolls and plate being arranged to fold said material gradually and successively.

2,001,400
AEROPLANE
George Adams Shamberger, Shaw, Oreg.
Application February 26, 1934, Serial No. 712,911
2 Claims. (Cl. 244—15)



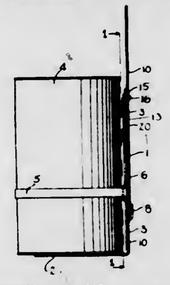
1. In an aeroplane including a fuselage and a wing having spaced upper and lower surfaces with vertically aligned openings therethrough, and including a helicopter propeller operatively mounted within the wing between the said openings thereof, the combination of upper and lower covers hinged to the margins of the wings and adapted to open and close outwardly over said openings, and means for simultaneously opening and closing the said covers.

2,001,401
FASTENING DEVICE
Philip Sidney, Jersey City, N. J.
Application September 16, 1932, Serial No. 633,411
4 Claims. (Cl. 24—112)



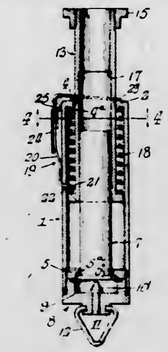
3. A fastening device comprising a hollow body member formed with an inwardly extending upper flange, a manipulating member rotatably and slidably secured to said body member for projection and retraction with respect thereto, said manipulating member being formed with an upper flange portion normally spaced from said body member and being additionally provided with a plate normally underlying and engaging the inner surface of the upper flange of said body member to limit the upward movement of said manipulating member, and a pin member fastened to said manipulating member and normally positioned within said hollow body member but being capable of projection beyond said body member when said upper flange portion of said manipulating member is advanced into contact with said body member.

2,001,402
FLOOR BOARD
Paul R. Weitzel, Newtown, Pa.
Application November 4, 1932, Serial No. 641,130
3 Claims. (Cl. 20—6)



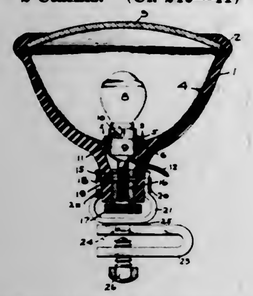
1. As a new article of manufacture, a wooden board having charred portions forming borders on its top surface extending along its longitudinal edge portions and contrasted with portions of the board between such borders and continuing down the adjacent portions of the longitudinal sides of the board, said borders being depressed below the top surface of portions of the board between such borders.

2,001,403
REFRIGERATOR DOORLOCK
Leroy E. Williams, Edgerton, Wis., assignor to Highway Trailer Company, Edgerton, Wis., a corporation of Wisconsin
Application March 24, 1933, Serial No. 662,476
6 Claims. (Cl. 70—74)



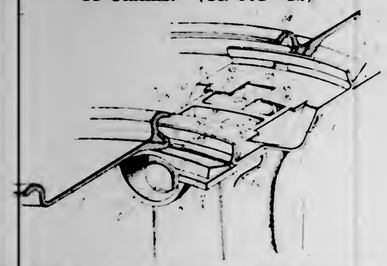
2. In a refrigerator, in combination, cooperating closure parts including a hinged door and its jamb; locking means comprising cooperating elements on the door and jamb respectively, one of said elements being rotatable into and out of engagement with the other; a shaft carried by one of said cooperating closure parts between the planes of its inner and outer surfaces for rotating the locking element on said closure part into and out of said engagement; a wheel on said shaft adjacent one end thereof; means on said closure part arranged to engage said wheel against rotation of the shaft in the direction for disengagement of said locking elements when the door has been closed, and means operable at will exteriorly of the refrigerator for effecting said disengagement.

2,001,404
CARD HOLDER AND DISPLAY STAND
Elliott S. Yancey, Houston, Tex.
Application May 15, 1933, Serial No. 671,162
12 Claims. (Cl. 40—10)



5. In combination with a card holder, a lock to retain a card in fixed position on the holder comprising a pin passed thru the card and the card holder with the pin head drawn down against the card, and means to receive said pin to latch it in locking position.

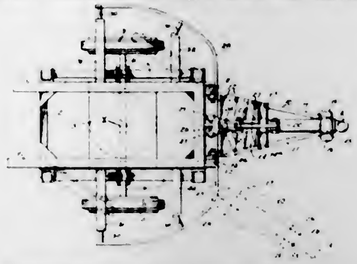
2,001,405
GAS CARTRIDGE FIRING DEVICE
Scott M. Abbott, Chicago, Ill.
Application September 28, 1932, Serial No. 635,214
8 Claims. (Cl. 42—2)



1. In a device of the kind described, a casing, a barrel partway withdrawable from and retractable into one end of said casing, means providing an external annular shoulder on said barrel positioned beyond said end of said casing when said barrel is so partway withdrawn therefrom, means movable transversely of said end of the casing for releasably engaging said shoulder, and means associated with fixed parts of said casing and barrel and operating when said barrel is thus released to cause a forceful retraction thereof into said casing.

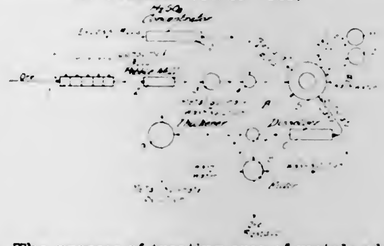
2,001,406
PORTABLE ELECTRIC LAMP
John W. Akers, Clarkston, Wash.
Application May 25, 1934, Serial No. 727,423
2 Claims. (Cl. 240—41)

1. The combination in an electric lamp with a reflector and a socket sleeve rigid therewith, a casing for the reflector and a resilient neck carried by the casing, of a lamp and its socket, said socket having a pair of exterior, longitudinally extending ribs fitted in and slidable in a pair of complementary grooves of the socket sleeve, a screw rigid with and extending rearwardly from the socket, a threaded nut on the screw within the neck, an exterior retaining ring on the nut engaged in a complementary groove in the neck, and an operating-head on the nut at the rear end of the neck.



2,001,407
SPACER MEANS FOR DUAL WHEELS
Frederick W. Burger, Niles, Mich., assignor to Clark Equipment Company, Buchanan, Mich., a corporation of Michigan
Application December 22, 1932, Serial No. 648,423
11 Claims. (Cl. 301—12)

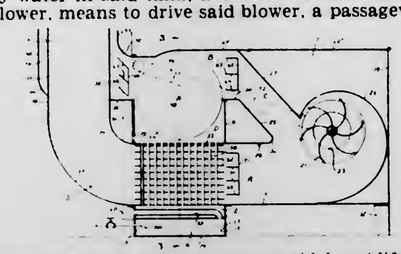
11. A spacer block adapted to be disposed between the rims of a felloe-less dual rimmed wheel, said spacer block comprising a section having marginal portions adapted to contact with the adjacent portions of the rims, and resilient end portions spaced in a circumferential direction relative to the wheel and adapted to engage opposide outer sides of a spoke end of the wheel for the purpose of accommodating relative movement between said rims while maintaining the spacer block in position on said spoke end.



2,001,408
AUTOMATIC EXTENSIBLE DRAWBAR
Robert N. Burton, River Forest, Ill., assignor to Highway Trailer Company, Edgerton, Wis., a corporation of Wisconsin
Application July 21, 1933, Serial No. 681,411
12 Claims. (Cl. 280—33.44)

1. In a trailer vehicle having a main frame and dirigible wheels associated therewith, draft means pivotally connected to said frame for lateral movement and connected for effecting steering adjustment of said wheels by such movement, said draft means including a draw bar having a

draft member mounted for longitudinal movement in the draw bar, and means arranged to control such longitudinal movement in response to steering movement of the draw bar.



2,001,409
PROCESS OF TREATING ORES WITH SULPHURIC ACID
Niels C. Christensen, Salt Lake City, Utah
Application January 4, 1933, Serial No. 650,200
27 Claims. (Cl. 23—125)

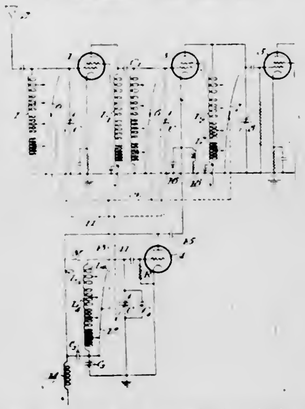
1. The process of treating ores of metals whose sulphates are characterized by a relatively high degree of solubility in water and a relatively low degree of solubility in sulphuric acid of a range of relatively high concentration, which consists in mixing said finely divided ore with a limited excess of relatively concentrated sulphuric acid sufficient in amount to form a fluid mixture with said ore but insufficient to dissolve more than a minor fraction of the sulphates of said metals, and treating said mixture in such manner as to convert said metal in said ore into the sulphate in solid form and to bring said excess of sulphuric acid in said mixture into the range of concentration in which the solubility of said metal sulphate is near the minimum, filtering excess acid away from said treated mixture and forming a filter cake of the metal sulphate particles and ore residue thus formed, and passing water through said cake in such proportion as to remove residual excess acid from said cake in relatively large proportion and metal sulphate in not more than relatively small proportion and leave the much greater part of said metal sulphate in said cake in solid form.

2,001,410
AIR CONDITIONING APPARATUS
Charles B. Cook, Los Angeles, Calif.
Application April 2, 1934, Serial No. 718,619
Renewed April 12, 1935
11 Claims. (Cl. 257—9)

3. In an air conditioning apparatus, a receptacle having a humidifying chamber therein, and having a heat exchange chamber therein, a tank in said air humidifying chamber, said tank having pipes communicating therewith, said pipes passing to said heat exchange chamber, a plurality of spaced members adapted to be wetted by water in said tank, a blower, an inlet to said blower, means to drive said blower, a passageway

extending from said blower to said humidifying chamber, a duct leading from said humidifying chamber, a second passageway leading from said blower to said heat exchange chamber, a second duct leading from said heat exchange chamber, said second duct being disposed within and surrounded by said first duct.

2,001,411
JACK FOR SEMITRAILERS
Durrel H. Davis, Edgerton, Wis., assignor to Highway Trailer Company, Edgerton, Wis., a corporation of Wisconsin
Application July 20, 1931, Serial No. 551,854
2 Claims. (Cl. 280—33.1)



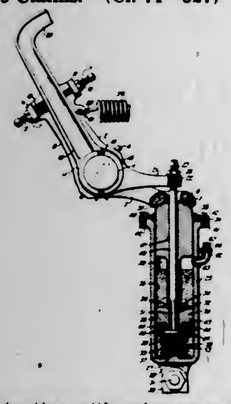
1. In combination with a tractor and a semitrailer detachably coupled thereto, temporary supporting means carried by the trailer adjacent its forward end and adjustable into and out of operative supporting position, an electric motor on the trailer, mechanism through which said motor is connected to the temporary supporting means for adjusting the latter into and out of operative position, a source of electrical energy on one of the vehicle units and a disengageable electric coupling to be disconnected when the vehicles are uncoupled, a reversing switch for said motor, and means cooperating with the said mechanism for actuating said switch when the supporting means arrives at either limit of its range of adjustment, together with a second switch in said circuit located on the tractor and adapted for opening and closing the motor circuit at will.

2,001,412
MANUFACTURE OF CHEWING GUM
Alfred Falk, Munich, Germany
No Drawing. Application March 24, 1933, Serial No. 662,529. In Germany April 19, 1932
1 Claim. (Cl. 99—16)

As a new article of manufacture a chewing gum, comprising a foundation of gum chicle, medicinal and flavouring ingredients of the usual character and an admixture of alpha-dammaroresene, thoroughly mixed with the former ingredients in the proportion of about 0.5–10% of the latter.

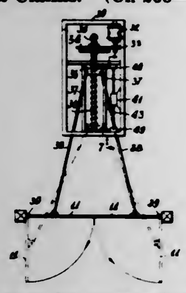
2,001,413
VACUUM TUBE OSCILLATOR
Paul O. Farnham, Boonton, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application February 16, 1932, Serial No. 593,335
7 Claims. (Cl. 250—36)

2. In an oscillator, a tuned circuit including a tapped inductance and a tuning condenser, a second circuit capacitively coupled to said tuned circuit, and means operative only when the tapped inductance is adjusted for resonating at the highest frequency bands to provide a second coupling of substantial magnitude for supplementing said first coupling.



2,001,414
INSECT EXTERMINATOR
William F. Folmer and Harrison L. Chapin, Rochester, N. Y., assignors to Folmer-Chapin Corporation, Rochester, N. Y., a corporation of New York
Application May 9, 1933, Serial No. 670,140
4 Claims. (Cl. 43—112)

1. In an electrified insect exterminator, the combination with a base frame, of a pair of spaced frames together constituting a unit offset therefrom and embodying screens composed of positive and negative high tension wires, high tension electric connections to the respective



screens, and insulated supports connecting the screen frames to each other and one of them to the base frame, the spacing of the frames being maintained at the bottom to allow insect bodies to fall clear of the base frame.

2,001,415
LEVER LOCK
Walter R. Freeman, Jay, Okla., assignor of one-fourth to John D. Freeman, Tulsa, Okla., and one-fourth to Claude D. Freeman, Dallas, Tex.
Application February 6, 1932, Serial No. 591,425
5 Claims. (Cl. 74—527)

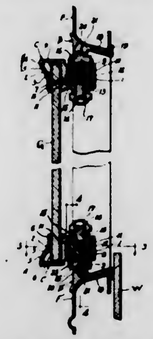
1. In combination with primary and secondary levers, locking means including a cylinder, a piston in the cylinder and yielding means for urging the piston into engagement with the primary lever for locking the primary lever in response to a joint movement of the levers in one direction, and valve means operable in response to release of the secondary lever for permitting return movement of the primary lever.

2,001,416
AUTOMATIC GARAGE DOOR OPENER
James Frezzolini, New York, N. Y.
Application September 14, 1932, Serial No. 633,056
2 Claims. (Cl. 268—33)

1. An operator for garage doors comprising a rectangular frame having a cross piece intermediate the ends thereof, a threaded shaft journalled in said cross piece and in one end of said frame, said shaft extending through said cross piece, a friction clutch mounted on the free end of said shaft, an electric motor mounted in said frame adjacent said clutch, gearing connecting said motor to said clutch to drive said shaft, guide members in said frame extending from said cross piece on opposite sides of said shaft to the end of said frame, a follower having a portion engaging said shaft and in guided relation with said guide members, means connecting said follower to said doors to operate same, means in said frame to control said motor comprising a snap action switch connected to said motor to drive the same in opposite directions located within said frame between one of said guide members and the side of said frame, a bar extending parallel with said shaft and operatively connected with said snap action switch to operate the same, the ends of said bar being bent at right angles to said shaft, and adjustable fingers on the ends of said bent portions of the bar extending into the path of said follower to be engaged thereby to operate said switch.

2,001,417
VACUUM EXTRACTOR
David Gessner, Worcester, Mass.
Application October 30, 1933, Serial No. 695,945
4 Claims. (Cl. 34—48)

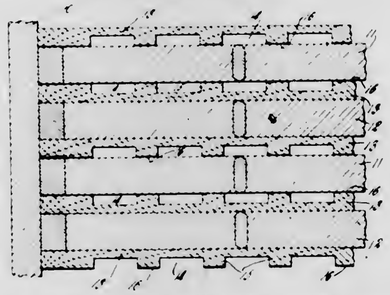
4. In an extractor, a vacuum member having a longitudinally extended slot, a continuous section of soft rubber tube overlying each end portion of said slot, fixed supports having openings therein for the outer end portions of said rubber tube sections, and clamping devices effective to hold said tube sections tensioned against said supports, each tube section having a longitudinally extended plug within its outer end portion to oppose the pressure of its clamping device and said plugs and clamping devices increasing the downward pressure of said tube sections on the end portions of said slot.



2,001,418
ACRIDONE DIANTHRIMIDE VAT DYESTUFFS AND THEIR PRODUCTION
Ivan Gubelmann and Robert J. Goodrich, South Milwaukee, and William Dettwyler, Milwaukee, Wis., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, a corporation of Delaware
No Drawing. Application April 30, 1931, Serial No. 534,134
17 Claims. (Cl. 260—37)

1. The process of preparing a 1,2-acridonyl alpha-alpha'-dianthrimide containing halogen in the Bz nucleus which comprises heating an alpha amino anthraquinone with a poly-halogen anthraquinone-1,2-acridone having halogen in the Bz nucleus and in an alpha position on the anthraquinone nucleus.

2,001,419
ANTHRAQUINONE ACRIDONE VAT DYESTUFF
Ivan Gubelmann and Robert J. Goodrich, South Milwaukee, and William Dettwyler, Milwaukee, Wis., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, a corporation of Delaware
No Drawing. Application April 30, 1931, Serial No. 534,135
8 Claims. (Cl. 260—36)

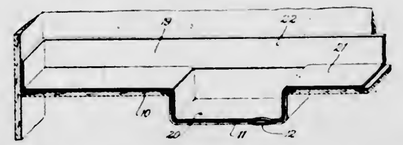


1. In the process of producing a novel dyestuff, the step which comprises condensing a Bz-halogen-1,2-acridonyl-alpha-alpha'-dianthrimide by the aid of an acid condensing agent.

2,001,420
AUXILIARY WINDSHIELD FOR MOTOR CARS
Leo M. Harvey, Los Angeles, Calif.
Application April 18, 1932, Serial No. 605,968
10 Claims. (Cl. 296—84)

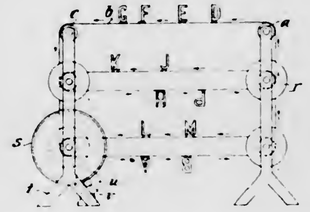
1. A windshield comprising a shield, clamps mounted on opposite extremities of said shield, a pair of brackets frictionally attachable to opposite portions of a supporting member, and adjustable attaching devices frictionally connecting said clamps with said brackets respectively, said attaching devices including means for stressing said brackets and holding the same in operative position and additionally holding said shield in adjusted positions for use, said clamps provided with sockets, said attaching devices including expansible barrels held in said sockets, and means for adjusting said barrels to vary the friction between said clamps and said brackets.

2,001,421
BATTERY SEPARATOR
Charles F. Haunz, Buffalo, N. Y.
Application July 21, 1933, Serial No. 681,590
12 Claims. (136—145)



1. A separator for storage batteries, comprising a thin board of wood having portions only of a face thereof coated with a metallic substance.

2,001,422
LIQUID COATING COMPOSITION
Hermann Heckel, Cincinnati, Ohio, assignor, by mesne assignments, to Emery Industries, Inc., Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application March 1, 1930, Serial No. 432,565
10 Claims. (Cl. 134—23)



1. An aqueous solution of a water soluble adhesive of the class described, white oil, and mahogany sulphonic bodies in proportions adapted to form a hard but flexible composition upon drying.

2,001,423
SINK AND DRAINBOARD CONSTRUCTION
Albert Horner, Kapaa Kauai, Territory of Hawaii
Application February 13, 1932, Serial No. 592,807
2 Claims. (Cl. 4—189)

1. A covering for drainboards, sinks and the like which comprises a continuous sheet of rubber and re-enforcing material molded to cover the entire working surface of a drainboard and to extend down into and form a complete lining for a sink, the margin of said sheet of material being upturned along certain of its edges to provide a protecting apron for the adjacent wall of a room along which the sink is built.

2,001,424
DISPLAY SIGN
Leonard John Huggett, London, England
Application October 28, 1933, Serial No. 695,584
In Great Britain October 29, 1932
4 Claims. (Cl. 40—32)

1. A display sign incorporating an endless band, a bank of pulleys consisting of two rows, each row comprising a plurality of pulleys arranged side by side on a single shaft, the band passing backward and forwards from one row to the other in a manner such that it passes over consecutive pulleys of the two rows in the course of its traverse from end to end of the bank, and provision for returning the band from one end to the other of the bank of pulleys, the band being adapted to receive characters such as letters or advertisements arranged to upstand therefrom.

2,001,425
PULL CHAIN SOCKET
Frank E. Johnson, New Bedford, Mass., assignor to John I. Paulding, Inc., New Bedford, Mass., a corporation of Massachusetts
Application November 17, 1933, Serial No. 698,444
5 Claims. (Cl. 173—354)

1. In a device of the character described, the combination of an actuating member, a spring for holding said member in normal position, a pull chain, comprising balls and connecting links, for moving said actuating member against the tension of said spring, a chain guide and means

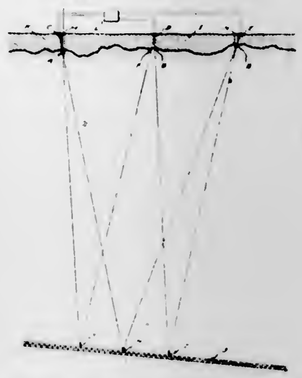
mounted on said actuating member and adapted, when said actuating member is in normal position,

to project between the two balls of said chain adjacent the inner end of said guide to prevent further inward movement of said pull chain.

2,001,426
BOTTLE CLOSURE
Frank J. Kaps, New York, N. Y.
Application December 4, 1933, Serial No. 700,767
3 Claims. (Cl. 215—43)

1. In a bottle closer, a member for the neck of a bottle and having a substantially cylindrical outer surface connecting with a top flat shoulder from which a threaded portion projects, and a cover for engagement over said member and having a portion threadedly engaging said threaded portion and connecting with a bottom flat shoulder having resilient elements adapted to engage niches upon the top flat shoulder for releasably holding said cover screwed upon said member.

2,001,427
ART OF COLORING ALUMINUM ARTICLES
James Francis Leahy, Fairhaven, Mass., assignor to Atlas Tack Corporation, Fairhaven, Mass., a corporation of New York
No Drawing. Application May 14, 1930, Serial No. 452,525
11 Claims. (Cl. 148—6)



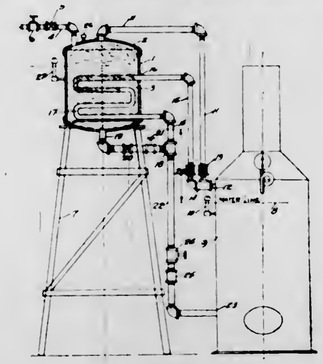
5. A process of coloring oxide-coated aluminum, which comprises treating the oxide-coated surface with a dye solution containing a weakly ionized acid.

2,001,428
STRUCTURAL UNIT
Edward H. McClintock, West Springfield, Mass.
Application August 3, 1934, Serial No. 738,313
6 Claims. (Cl. 189—40)

1. A composite structural unit, comprising, a strip of nailing medium presenting a pair of opposed wedge-shaped portions, a pair of load-bearing angle bars of metal one for each said wedge-shaped portion, each angle bar having the legs thereof engaged one with each of the two faces of its wedge-shaped portion and throughout substantially the entire length thereof and having the corner of the angle bar located adjacent the narrow part of the wedge, and means acting on the angle bars along the corners thereof for drawing said bars together to compress said strip therebetween.

2,001,429
METHOD OF MAKING DIP DETERMINATIONS OF GEOLOGICAL STRATA
Elton V. McCollum, Ponca City, Okla., and George C. McGhee, Eunice, La., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Application July 9, 1934, Serial No. 734,268
2 Claims. (Cl. 181—0.5)

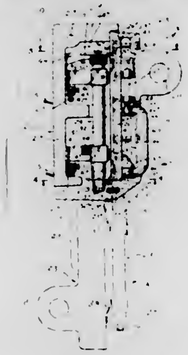
1. A method of determining the amount and direction of dip of buried geological strata including the steps of generating vibrations at spaced points below the weathered layer of the earth's surface, and receiving the vibrations after they have traveled through the earth at a point intermediate the vibration generating points.



2,001,430
RESINOUS PRODUCT AND PROCESS OF MAKING SAME
Joseph V. Melgs, Hastings upon Hudson, N. Y., assignor to Plastix Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Original application January 15, 1927, Serial No. 161,468. Divided and this application July 14, 1932, Serial No. 622,458
2 Claims. (Cl. 260—2)

1. In a process for making a carbohydrate phenol resin, the improvement which comprises reacting the carbohydrate and phenol mixture with an ingredient selected from the group consisting of free fatty acids, cotton seed pitch, stearine pitch, candle pitch and palm oil pitch in a quantity sufficient to combine with the other ingredients to form a resin of increased water resistance, impact strength and transverse breaking strength.

2,001,431
WATER LOCK BOILER FEED SYSTEM
Waldo D. Nore, North Pitcairn, Pa.
Application March 9, 1934, Serial No. 714,859
3 Claims. (Cl. 122—458)

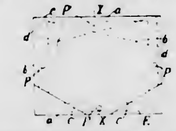


1. In a device of the class described comprising a tank positioned above a water line of a steam boiler, a valve controlled water inlet pipe for said tank, steam line connections between said steam boiler and said tank, an outlet means for

allowing water within said tank to flow downwardly by gravity and enter said steam boiler, a steam line leading from said steam boiler to

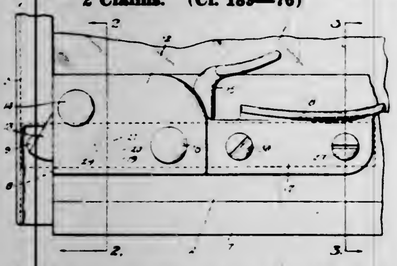
said tank and provided with a coil within said tank and extending out of said tank and connected to said outlet means leading to said steam boiler.

2,001,432
CIRCUIT CONTROLLING AND INDICATING DEVICE
Bror G. Olving, Hamden, Conn., assignor to Products Protection Corporation, a corporation of Delaware
Application March 11, 1933, Serial No. 660,379
21 Claims. (Cl. 200—121)



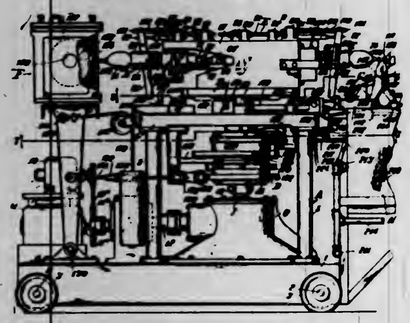
1. In apparatus of the character described, in combination, an open box-like container carrying therein contact members, closure means for said container, said means being shaped to have therein a chamber, circuit-controlling means positioned and enclosed within said container when said closure means is in closing position but being mounted on that side of said closure means facing inwardly of said container, said controlling means having contact means for engaging said contact means within the container when said closure means is moved into closing position and for disengaging therefrom when said closure means is moved into container-opening position, said closure means having a window communicating with said chamber, a gaseous conduction tube mounted within said chamber and exposed through said window, an impedance device mounted within said chamber and serially connected with said tube, and contact means forming the terminals of said serially arranged impedance and tube, said contact means being exposed on that face of said closure means that faces the inside of said container and being in electrical connection with said circuit-controlling means.

2,001,433
COMBINATION WEATHER-STRIP AND WINDOW FRAME
Hermann J. Schubert, Hackensack, N. J.
Application August 10, 1933, Serial No. 684,481
12 Claims. (Cl. 20—45)



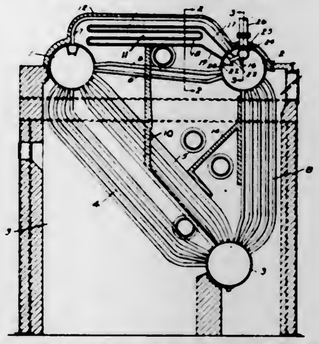
1. In a mechanism of the class described, the combination with window sashes and a frame having channels in which the sashes slide, of strips on the sides of the channels, some of which are stationary and others of which have stationary and movable sections, an angular weather-strip on one sash engaging and slidable on one of the two-part strips, and an angular weather-strip on the other sash, together with an angular strip on the other two-part strip engaged by the aforesaid angular strip on the other sash, and means for locking together the two parts of the latter strip, comprising a pin on one strip entering a slot in the other.

2,001,434
SAFETY CLOSURE FOR LETTERS
Albert Schülze, Neustadt-on-the-Tafelfichte, Czechoslovakia
Application June 30, 1932, Serial No. 620,139
In Czechoslovakia February 22, 1932
2 Claims. (Cl. 229—68)



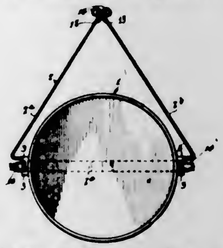
1. A safety closure for letters, more particularly letters containing valuable enclosures, comprising in combination: an envelope having a plurality of end and side flaps; a separate protecting sheath for the reception of the letter, said sheath being removably arranged within said envelope; reinforcing strips at the sides and bottom of said sheath; and sealing means passing through all the flaps of said envelope and through said reinforcing strips, whereby said sheath and said envelope are fastened together.

2,001,435
BUS OR CAR WINDOW CONSTRUCTION
Joseph Schunk, Newark, N. J., assignor to National Lock Washer Company, Newark, N. J., a corporation of New Jersey
Application August 24, 1933, Serial No. 686,533
2 Claims. (Cl. 189—76)



1. In a window construction, a glass panel, a horizontal rail of channel form receiving a horizontal edge of said glass panel, said rail having a vertical end and its channel including an upper glass receiving portion and a lower portion forming a horizontal passage below said glass panel and open at said vertical end, a removable vertical side strap of channel form receiving a vertical edge of said glass panel having a horizontal extension member permanently secured thereto, said extension member being removably engaged longitudinally within said lower portion of the channel of said rail, the vertical inner edge of said side strap engaging the vertical end of said rail, a lock casing engaged upon one side of said rail, and unitary fastening means extending between the sides of said rail and securing said lock casing exteriorly of said rail and said extension interiorly of said rail, said fastening means adapted to draw said sides of the rail toward each other into binding relation with said extension and with the sides of the glass panel within said rail.

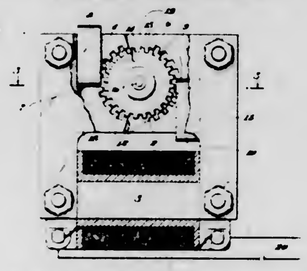
2,001,436
MACHINE FOR FLARING GLASS ARTICLES
Harold R. Schutz, Ottawa Hills, Ohio, assignor to The Libbey Glass Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Application March 25, 1933, Serial No. 662,767
22 Claims. (Cl. 49—7)



1. In a machine for flaring glass articles, means for supporting and rotating the article to be flared, a backing tool and a flaring tool bodily movable toward and from one another, means for supporting the tools and moving them as a unit toward the axis of rotation of the article and into position at opposite sides of the glass article to be flared, means for moving the flaring tool into engagement with the article so that one end of the tool is positioned substantially in the axis of rotation of the article, and means for swinging the flaring tool about the first mentioned end toward a position perpendicular to the axis of rotation of the article.

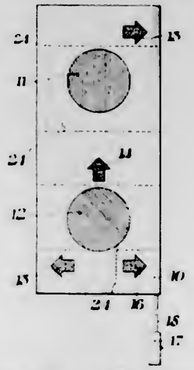
2,001,437
STEAM GENERATOR
Mark E. Smith, Erie, Pa., assignor to Union Iron Works, Erie, Pa., a corporation of Pennsylvania
Application July 19, 1934, Serial No. 736,005
5 Claims. (Cl. 122—478)

1. In a steam generator, the combination of a discharge steam drum; circulating tubes leading to and from said drum; a chamber in the steam discharge drum; steam tubes leading through the drum shell into the chamber; a steam collecting conduit in the steam discharge drum; and tubes in the steam discharge drum connecting the chamber and the conduit.



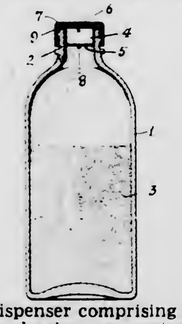
2,001,438
TRAY
William R. Stuck, Los Angeles, Calif.
Application November 30, 1932, Serial No. 644,991
12 Claims. (Cl. 65—53)

2. A tray having a body with a pin projecting outwardly from the side thereof, a supporting member pivotally mounted on the pin, yieldingly pressing itself against the tray body, and shoulders projecting from side portions of said tray cooperating with the opposite side edges of the supporting member to hold the same against rotation and enabling the supporting member to be disengaged from the shoulders by an outward movement while maintained on the pin and enabling the supporting member to be moved into a folded position on the outside of the tray.



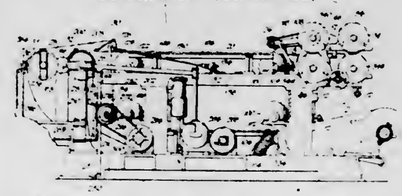
12. A tray having a body with a pin projecting outwardly on one side of the same and having another pin projecting outwardly on the opposite side of the body and in axial alignment with the first-named pin, supporting means comprising arms pivotally mounted on the pins, a head placed on the outer end of each pin, said arms being yieldingly pressed against the sides of the tray body, fixed shoulders on the tray for normally holding the supporting means against rotation from a position at right angles to the tray body, other fixed shoulders capable of cooperating with the supporting member to hold the same in a folded position, said pins having a length sufficient to enable the supporting member to be disengaged from the shoulders without being disengaged from the pins, all of the above mentioned parts cooperating to enable the arms to be disengaged from the shoulders by an outward movement on the axis of the pins.

2,001,439
SYNCHRONOUS MOTOR
Milton E. Thompson, Ridgway, Pa.
Application March 17, 1933, Serial No. 661,218
9 Claims. (Cl. 172—278)



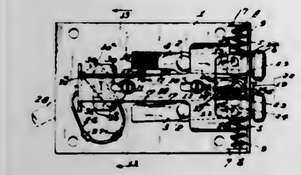
1. A single phase synchronous motor having a rotor and a field structure with two pole faces, each pole face comprising a shaded section having a plurality of teeth thereon and an unshaded section likewise having a plurality of teeth thereon, the teeth of the shaded section of each pole face being advanced relatively to the teeth on the unshaded section of that pole face.

2,001,440
TRAFFICE SIGNALING SYSTEM
Ethrea Charles West, Rochester, N. Y.
Application September 22, 1931, Serial No. 564,297
7 Claims. (Cl. 177—329)



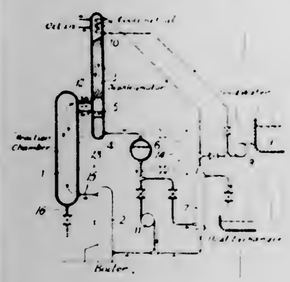
7. In a program traffic signaling system, a signal of one character indicating the permissible passage of traffic, a signal of another character indicating that traffic shall not pass, turn indicators positioned adjacent one of said signals, circuits for controlling the operation of said signals and said indicators, timing means for controlling the completion of said circuits according to a prearranged schedule, and manually operated means for selectively disabling the circuits of any of said indicators.

2,001,441
POWDER DISPENSER
Leslie D. Whitney, Palo Alto, Calif.
Application November 3, 1934, Serial No. 751,365
1 Claim. (Cl. 221—61)



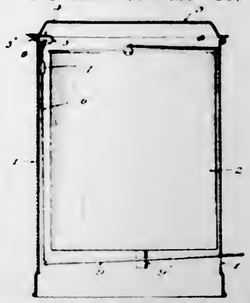
A powder-dispenser comprising in combination a glass-bottle having an externally-threaded neck with a full-open throat; a metal sleeve in said throat of a length proportioned to that of the neck-throat and of a diameter adapting it for readily insertable and removable frictional contact throughout its length with the throat wall, said sleeve having a full-open top with a penetration-limiting flange resting on the top of the neck and a partially open, relatively stiff bottom-wall of less discharge capacity than the full-open top; and a flat-top screw-cap fitted upon the neck of the bottle to lie closely upon and cover the full-open top of the sleeve.

2,001,442
MACHINE FOR AND METHOD OF MANUFACTURING BAG TUBES
Frank G. Wikstrom, Brooklyn, N. Y., assignor to Arkell & Smiths, Canajoharie, N. Y., a corporation of New York
Application July 18, 1928, Serial No. 293,738
34 Claims. (Cl. 93—81)



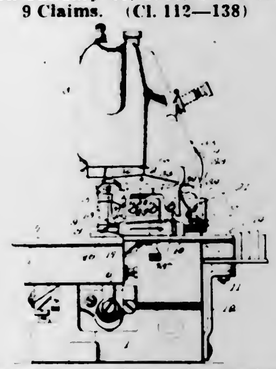
1. A machine for use in the manufacture of bag tubes having, in combination, means for feeding a strip longitudinally, means for applying adhesive to one end of the strip, means for winding the strip upon itself a plurality of times so as to form a tube with the outer end of the strip secured by said adhesive, means for removing the tube from said winding means, and means for flattening the tube when removed from said winding means.

2,001,443
AUTOMOBILE DOORLOCK
Harry Williams, Detroit, Mich.
Application March 2, 1934, Serial No. 713,696
3 Claims. (Cl. 292—333)



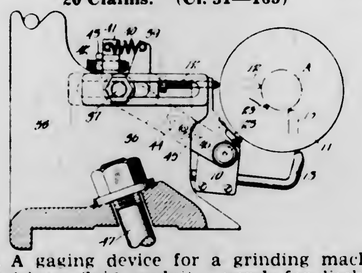
2. In a vehicle door lock, a lock casing; a pair of rocking locking arms pivoted to the casing, having sockets to receive the arms of a spring actuated latch member, with one end of each rocking locking arm extending through slots in the casing to engage a keeper; a lug projecting from each rocking locking arm; a slidable bifurcated bar having inclined notched tines adapted to coordinate with the lugs of the rocking locking arms, whereby said arms may be held in locking engagement with a keeper adapted to coordinate with the rocking locking arms to lock a door; and a spring actuated latch member having laterally extending arms adapted to automatically maintain the rocking locking arms in unlocked relation to the keeper, said latch member having a thrust finger, extending through the wall of the casing, whereby it may contact a keeper to snitt the latch on closing the door, that the arms of the latch member may enter the sockets in the rocking locking arms, thereby releasing the arms that they may interlock with the keeper.

2,001,444
PROCESS OF REFINING OILS AND THE LIKE BY STEAM TREATMENT
Georg Zotos, Charlottenburg, Germany
Application July 2, 1931, Serial No. 548,427
In Germany March 3, 1930
3 Claims. (Cl. 196—63)



1. A process of cracking mineral tar oils and similar substances, comprising feeding the initial substance through a dephlegmating zone into a reaction zone, generating steam at a pressure of about 200 atmospheres, feeding said steam at such pressure and at a temperature of about 500° C. through the reaction zone into the dephlegmating zone, condensing the major portion of the steam in the dephlegmating zone into water under pressure, and utilising said water under pressure in the steam generation.

2,001,445
RECEPTACLE
Theodore J. Abele, Peoria, Ill., assignor to Stuber & Kuck Co., Peoria, Ill., a corporation of Illinois
Application January 24, 1934, Serial No. 708,070
1 Claim. (Cl. 220—36)



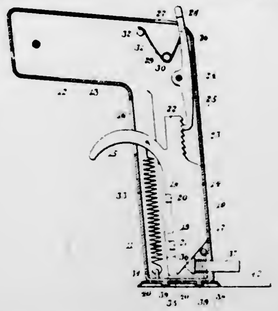
The combination with a receptacle having a hinged cover, of a member extending from the said cover adjacent the hinge thereof and having a free extremity directed away from said hinge toward the opposite edge of the cover and recurved forming a hook whose terminus is directed back toward the wall to which the cover is hinged, in any position of said cover, the recurved terminus lying in spaced relation to the last named wall and directed in a line lying at right angles to said wall directly below the hinge in the closed position of the cover, and a rod shiftable substantially parallel to the said wall adapted to pass between the latter and the said terminus and to enter the bight of said hook in the wide open position of the cover, the hook enclosing the end of the rod in the named position.

2,001,446
BINDER SUPPORT FOR SEWING MACHINES
Frank A. Kucera, Chicago, Ill., assignor to Union Special Machine Company, Chicago, Ill., a corporation of Illinois
Application January 20, 1934, Serial No. 707,575
9 Claims. (Cl. 112—138)

1. In a sewing machine, the combination of a supporting bed, a standard carried thereby, a work support spaced from said standard, a binder for directing a binding strip about the edge of the fabric section being stitched, means for supporting said binder on said standard whereby the same may be moved to a set operative position and to an inoperative position including a pivotally supported latch engaging the binder support for holding the binder in a set position, said latch having a handle member disposed so that a movement thereof in a direction for releasing the latch will also move said binder away from operative position.

2,001,447
AUTOMATIC CONTROL MECHANISM
Harold E. Balsiger, Waynesboro, Pa., assignor to Landis Tool Company, Waynesboro, Pa., a corporation of Pennsylvania
Application March 12, 1932, Serial No. 598,498
20 Claims. (Cl. 51—165)

10. A gaging device for a grinding machine, comprising a fluid conduit, a nozzle for discharging the fluid therefrom, means responsive to a change in size of the work for varying the flow of fluid from the nozzle, said conduit having a restricted passage for production a velocity change in the flow of the fluid, said velocity change varying in response to a change in the flow of fluid through said nozzle, and means connected to said conduit at said restricted passage and controlled by the velocity change at the restricted passage for controlling the action of the grinding machine.



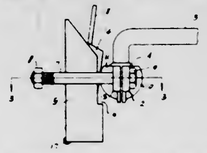
2,001,448
MANUFACTURE OF ARTIFICIALLY COLORED GRANULES
Milton R. Beasley, Norwood, Mass., assignor to Bird & Son, Inc., East Walpole, Mass., a corporation of Massachusetts
No Drawing. Application May 2, 1934, Serial No. 723,545
9 Claims. (Cl. 91—70)

1. The method of coloring granules of the class described which consists in first coating the same with a hydrous plastic clay, then applying to the granules thus coated, a second coating including sodium silicate, one of said coatings having therein a coloring pigment, and finally heating said granules to a temperature sufficently high to react said coatings in situ inter se and produce on said particles an insoluble colored exterior glaze.

7. The method of coating granules of the class described which consists in first coating the same with a hydrous plastic clay, then applying to the granules thus coated a second coating including sodium silicate, and finally heating said granules to a temperature sufficiently high to react said coatings in situ inter se and produce on said particles an insoluble exterior glaze, the major portion of which glaze consists of the reaction product of said clay and said silicate.

2,001,449
TOY PISTOL
Ernest H. Bergstrom, Dorchester, Mass.
Application April 18, 1934, Serial No. 721,120
12 Claims. (Cl. 273—129)

1. In a device of the class described, an elongated chambered housing; a plunger perpendicular to and near one end of said housing; a spring surrounding and normally retaining said plunger



in retracted position; and movable means in said housing for forcing said plunger outwardly against the tension of said spring.

2,001,450
TRANSMITTING CIRCUIT
Clarence A. Boddie, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application September 16, 1926, Serial No. 135,791
7 Claims. (Cl. 177—352)

1. In a power system employing a plurality of sources of signal energy at different signalling frequencies for duplex communication thereover, a plurality of conductors, apparatus interposed between said conductors of a type through which the signalling energy cannot be transmitted and means for by-passing said signalling energy about said apparatus, said means comprising coupling means between said conductors of a type having the property of an electrical impedance that is large for the frequencies of said signalling energy and a plurality of electrical impedances coupled to said coupling means and forming with said coupling means a network of resonant and anti-resonant circuits which network is resonant at a plurality of the frequencies of said signalling energy.

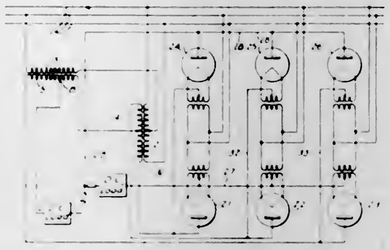
2,001,451
TRAILER HITCH
Fritz J. Boehler, Houston, Tex.
Application December 9, 1933, Serial No. 701,652
3 Claims. (Cl. 280—33.15)

1. A trailer hitch comprising a guide, a pair of rods between which the guide is secured, said rods forming means for attaching the guide to a draft vehicle, a socket joint member on said

rods formed of complemental sections one of which is movable relative to the other and a wedge member in the guide normally wedging against said movable section.

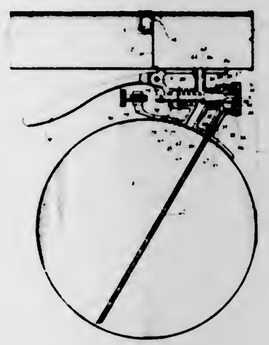
2,001,452
READY MADE TIE
Isidor Bronshvaig, Bronx, N. Y.
Application May 23, 1934, Serial No. 727,185
2 Claims. (Cl. 2—150)

1. For use in preparing a ready made necktie, a pre-shaped metallic shell having the shape of a necktie knot, said shell tapering from a curved upper edge to a straight lower edge, and being open at its rear from the top to the bottom, a plurality of stitch receiving apertures adjacent the rear edges of said shell, and a downwardly extending tongue struck inwardly from said shell adjacent its bottom edge to assist in holding slip portions of a tie therein, said tongue ending within the confines of said shell.



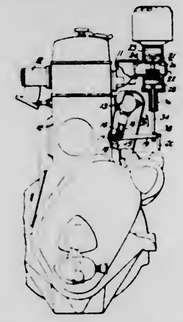
2,001,453
VALVE CONTROL
Robert W. Crossen, Jr., Plainfield, Ill., assignor to Farrell Manufacturing Company, Joliet, Ill., a corporation of Illinois
Application August 3, 1931, Serial No. 554,653
8 Claims. (Cl. 137—21)

1. In a dispensing system, the combination of liquid reservoirs, a discharge connection to each of said reservoirs, means for selectively permitting and preventing flow from said reservoirs to said discharge connections, a unitary assembly remotely located from said first named means, said assembly comprising a single housing having means disposed therein for selectively operating a single one of said first named means, an expansible member in said first named means for effecting operation thereof, and an expansible member in said housing in pressure communication with said first named expansible member whereby operation of said second named expansible member operates said first named expansible member.



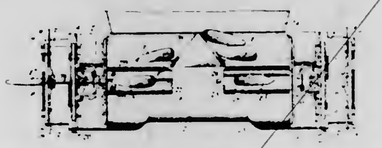
2,001,454
THREE-PHASE RECTIFIER TRANSFORMER
Robert L. Davis, Grand Rapids, Mich., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application June 27, 1933, Serial No. 677,839
7 Claims. (Cl. 175—363)

2. In a power supply system, a source of polyphase current, a plurality of groups of transformers and rectifiers, each group including pairs of rectifiers, one pair for each phase, each group having two conductors, one conductor uniting the cathodes of one member of each pair, the other conductor uniting the anodes of the other member of each pair, said two conductors constituting the direct-current terminals of their group, means connected to said conductors for uniting said



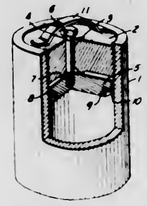
groups into a cooperative system for delivering direct-current power, the transformers in each of said groups being T-connected and thereby affording neutral points and means connected to said neutral points for cooperating with said first-named means for delivering direct-current power at voltages less than the full voltage of the system.

2,001,455
SPRAYING DEVICE
Nicholas W. De Frees, Hastings, Minn., assignor to H. D. Hudson Manufacturing Company, Chicago, Ill., a corporation of Minnesota
Application June 16, 1932, Serial No. 617,570
2 Claims. (Cl. 299—89)



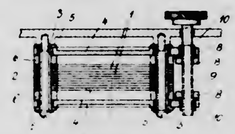
2. A spraying device comprising a cylindrical tank and an air pump having a barrel, the long axis of the tank and barrel being substantially at right angles to one another, a casting as the principal means connecting the barrel to the tank, said casting having opposed spaced plate-like foot portions respectively conforming to the configuration of and secured to tank and barrel by soldering, said casting having a bore axially parallel with the barrel and terminating in a spraying orifice, a valve seat and valve cooperative with the seat and adapted to control the orifice, passages in said casting and tank and barrel establishing communication between the pump barrel and tank across the bore and at one side of the valve and seat, passages in said casting establishing communication between said tank and bore adjacent said orifice, said casting being of less width than the diameter of the barrel and having its orificed end lying at the inside of a plane tangent to the tank and cutting the end of the barrel, and means for operating the valve.

2,001,456
INTERNAL COMBUSTION ENGINE
Torbjörn Viktor Dillström, Stockholm, Sweden, assignor to Hesselman Motor Corporation, Ltd., London, England, a corporation of Great Britain
Application September 27, 1932, Serial No. 635,003
In Germany October 5, 1931
21 Claims. (Cl. 123—139)



1. Charge-forming apparatus for internal combustion engines comprising a pump for supplying fuel to the engine, a valve for controlling flow of air to the engine for combustion with said fuel, said valve comprising a valve member arranged to be opened by the pressure of air controlled by the valve, a loading spring for closing the valve, regulating means adjustable to concomitantly determine the quantity of fuel delivered and the force required to open the valve and means for absorbing the reaction of the loading spring independently of the valve regulating means.

2,001,457
CORN CUTTING MACHINE
Frank W. Douthitt, Ortonville, Minn.
Application April 8, 1931, Serial No. 528,690
17 Claims. (Cl. 130—9)

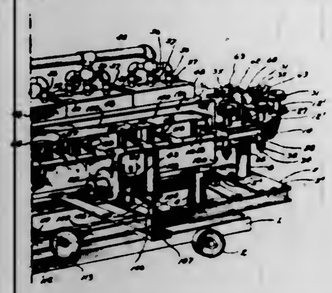


1. A machine for cutting corn comprising a cutting head, a plunger for forcing the ear through the head, means for receiving and guiding the ear including clamping members, an ear supporting device associated with each clamping member, a shaft on which the clamping member and associated supporting device are mounted, the supporting device being rigid with the shaft and the clamping member free thereon, said shaft having an arm projecting therefrom, and said clamping device having a projecting arm, an actuating shaft, an arm carried thereby, a link connecting said last-named arm to the arm connected with the ear supporting device, a link connecting the arm on said actuating shaft with the arm attached to the clamping member whereby said clamping member and supporting device are interconnected, a spring for moving the actuating shaft to cause the clamping member to engage the ear, a cam supporting member, and cams carried thereby and operating upon the shafts for actuating the respective clamping members and associated ear supporting devices.

2,001,458
SAFETY PLUG
Irwin L. Dunn, Tulsa, Okla.
Application March 20, 1933, Serial No. 661,781
7 Claims. (Cl. 220—46)

1. A safety plug for a tubular body including a retainer adapted for removable, locked mounting in said body, and having a boss on its inner face, a follower, a bolt extended loosely through the retainer and threadedly attached to the follower, and a packing ring on the follower including a flexible member compressible against the wall of said body by fluid under pressure in said body.

2,001,459
ELECTRIC VARIABLE CONDENSER
Peter Grassmann, Berlin, Germany
Application October 24, 1933, Serial No. 695,023
In Germany August 10, 1932
5 Claims. (Cl. 175—41.5)



1. An electric variable condenser comprising two rigid frames so mounted as to permit one to rotate within the other, and condenser vanes mounted in each of said frames, said vanes being so thin as to be non-rigid and incapable of supporting their own weight and being in stretched condition so as to lie in parallel planes within said frames.

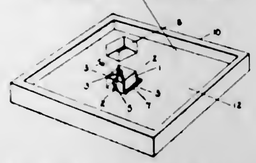
2,001,460
APPARATUS FOR FORMING PLATES
George R. Haub, Washington, Pa., assignor to Hazel-Atlas Glass Company, Wheeling W. Va., a corporation of West Virginia
Application August 27, 1931, Serial No. 559,797
5 Claims. (Cl. 49—7)

1. Apparatus of the class described including a plurality of traveling shapers, a sprocket chain

and sprocket wheels for imparting movement to the shapers, and guide means associated with

one sprocket wheel for properly centering articles placed in the shapers.

2,001,461
SHIRRED TUBING AND METHOD OF PREPARING THE SAME
Alfred G. Hewitt, Chicago, Ill., assignor to The Visking Corporation, Chicago, Ill., a corporation of Virginia
Application June 8, 1934, Serial No. 729,728
8 Claims. (Cl. 17—45)



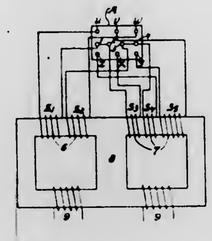
1. A method of preparing an artificial sausage-casing for shipping and handling which comprises: preliminarily shirring the casing; and then subjecting the shirred product to a compressing operation which forces the folds into close mutually supporting relation, thus forming a self-sustaining product.

2,001,462
INDEX CARD
Friedrich Hiller, Cologne-on-the-Rhine, Germany
Application October 1, 1932, Serial No. 635,801
In Germany October 12, 1931
9 Claims. (Cl. 129—16.5)

1. The combination with a series of index cards each having on opposite side edges a row of spaced openings, said rows extending parallel to said side edges, and a pair of flexible strands each extending through one of the openings of a respective row, the openings of successive cards receiving said strands being successively offset upwardly from the bottom of the rearmost card of the series whereby like marginal top portions of the cards are displaced upwardly from the front to the rear of the series upon tensioning said strands, said strands being each free from knots between its ends.

2,001,463
BEE FEEDER
Adam Carl Kehrle, Buckfastleigh, England
Application October 11, 1933, Serial No. 693,188
In Great Britain March 27, 1933
10 Claims. (Cl. 6—5)

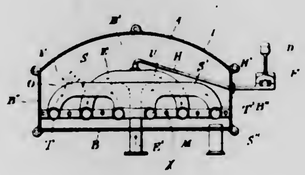
1. In a bee feeder of the kind specified, a block to upstand from the surface of the food and formed with a passageway for the bees leading from the interior of the hive to the exterior of the block at the surface of the food, and a cap to fit over the block and occupy thereon a plurality of positions selectively, which cap is adapted, according to its position, differentially to control the effective width of the passage-way at the surface of the food from a width permitting a plurality of bees to feed at said surface simultaneously to a width permitting one bee only to feed thereat at a time.



2,001,464
CONTAINER
Mary D. Kerr, Columbia, S. C.
Application January 22, 1934, Serial No. 707,826
20 Claims. (Cl. 206—56)

1. A lipstick container comprising a casing for reciprocably receiving a lipstick, a spring for urging the stick outward, means for preventing the outward movement, said means including a member carried by the stick, and a cover reciprocably receivable by said casing, the proximate surfaces of the casing and cover being substantially cylindrical whereby the casing and cover are relatively rotatable, a projection on one of said surfaces and a transverse slot in the other whereby said cover is rotatable into and out of locking engagement with the casing, said cover adapted to engage said member for releasing the preventing means when locked on the casing by rotation in one direction and for locking the preventing means when unlocked from the casing by rotation in the opposite direction.

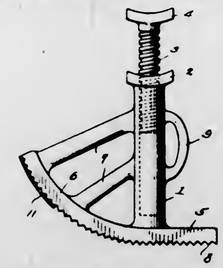
2,001,465
TRANSFORMER FOR THE CONVERSION OF POLYPHASE CURRENTS
Hendrik Abraham Wijnand Klinkhamer, Eindhoven, Netherlands, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application April 20, 1934, Serial No. 721,636
In The Netherlands May 17, 1933
3 Claims. (Cl. 172—238)



1. A transformer assembly to convert polyphase currents in accordance with the "Scott connection", said assembly comprising at least two windings, the first winding being divided into two individual sections and the second winding

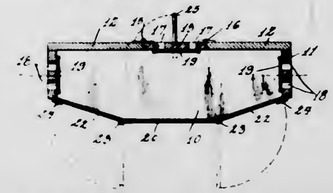
into three individual sections, the ratio of the induced voltages of the five sections being approximately:

$$1:1:\tfrac{1}{2}\sqrt{3}:\tfrac{1}{2}\sqrt{3}:\tfrac{3}{2}\sqrt{3}$$



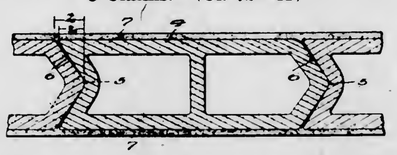
2,001,466
FUEL CHARGE HEATING MEANS FOR AUTOMOTIVE VEHICLES
Carlos Laugier, Mexico, D. F., Mexico, assignor of thirty per cent to Marcos Odriozola and thirty per cent to Thomas Reyes Retana, both of Mexico, D. F., Mexico
Application March 8, 1933, Serial No. 660,060
In Mexico July 22, 1932
4 Claims. (Cl. 123—122)

1. The combination of the intake and exhaust manifolds of an internal combustion motor operated from a low burning fuel, a structure enclosing said manifolds and providing a heat chamber, said exhaust manifold being closed at its discharge end and formed with an opening remote from said end for discharging the products of combustion received from the motor directly into said chamber for heating the fuel charge passing through said intake manifold to enhance the expansive power of said charge, and said structure being provided with means at a point remote from said opening for the discharge of the products of combustion from the heat chamber.



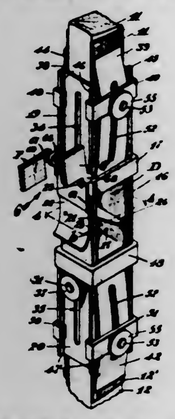
2,001,467
VEHICLE JACK
Joseph M. Madigan, Detroit, Mich.
Application September 13, 1934, Serial No. 743,906
5 Claims. (Cl. 254—94)

2. A jack including a rocker having a straight end portion and a bottom recess in the other end portion, a standard upstanding from said end portion, means thereon for engaging an axle, and a pad seated within and normally extending from the recess in the rocker for frictional engagement with a supporting surface when the jack is in one extreme position, said pad being



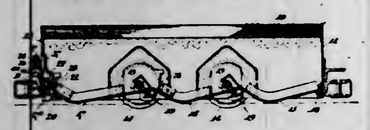
expansible laterally into gripping engagement with the walls of the recess when the pad is subjected to pressure from a supported load.

2,001,468
BAIT OR MINNOW BOX
Emil E. Moutoux, Riverhead, N. Y.
Application August 4, 1934, Serial No. 738,521
3 Claims. (Cl. 43—55)



1. A floatable bait box having a generally rectangular body including side and end walls and a top and base, said top comprising two end sections and an intermediate hinged section forming a door by means of which access may normally be had to the interior of the body, said door and said end walls having screen covered openings, and said base comprising a permanent central horizontal screen section, and upwardly, outwardly inclined screen sections hinged at their inner edges to said central section and forming drop doors to permit thorough discharge from the box and cleaning of its entire interior, and latches normally holding said top door and bottom drop doors in position.

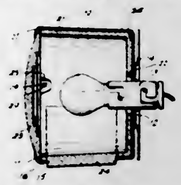
2,001,469
BUILDING WALL
Luther S. Munson, West Riverdale, Md., assignor to Munlock Engineering Company, Washington, D. C., a corporation
Application September 14, 1933, Serial No. 689,471
5 Claims. (Cl. 72—41)



1. In a wall construction formed of interfitting tile elements having interfitting end portions consisting of V-shaped protrusions and recesses, the walls of the protrusions being of less angularity than the walls of the recesses, the apices only of the protrusions impinging against the walls of their complemental recesses.

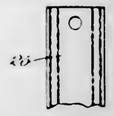
2,001,470
ARCHER'S BOW
Yngve J. Nyvall, San Pedro, Calif.
Application May 9, 1932, Serial No. 610,006
12 Claims. (Cl. 273—107.5)

1. In an archer's bow, an intermediate bow section having an arrow receiving opening leading therethrough formed with a side wall slot through which an arrow may be laterally passed, and means for closing said slot.



2,001,471
LATCH FOR AUTOMATIC DUMPING VEHICLES
Hugh W. Sanford, Knoxville, Tenn.
Application December 3, 1932, Serial No. 645,603
15 Claims. (Cl. 105—253)

1. A dump vehicle including a body and a dumping door, a latch for securing said door in closed position, a latch controlling member located adjacent the center of the width of the vehicle, and means having a plurality of parts pivotally connected to said member and exposed for conjoint operation by a plurality of elements located along the route of said vehicle for actuating said member to release said latch, said means moving pivotally relative to said member and being inoperative upon movement of less than all said parts for causing the release of said latch.



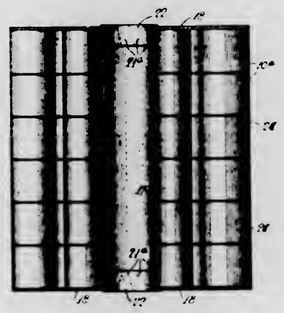
2,001,472
LAMP
Henry J. Sauer, Fairfield, Conn., assignor to The Kilborn-Sauer Company, Fairfield, Conn., a corporation of Connecticut
Application January 9, 1935, Serial No. 1,008
12 Claims. (Cl. 240—8.3)

1. In a lamp, a cuplike casing having an inturned flange at its forward open end, said casing having a split opening extending from its forward edge rearwardly and whereby the forward open end may be opened bevond its normal opening, means within said casing forming a shoulder inwardly spaced from said inturned flange, a lens having an outside diameter larger than the inside diameter of said inturned flange in its normal position and having its peripheral edge disposed and held between said shoulder and said flange, said lens being insertable in said cas-

ing by said opening of the forward end of said casing beyond its normal opening, and means securing said split open end to normally retain said normal opening.

2,001,473
DOUBLE WALL STRUCTURE
Wallace W. Smith, Chicago, Ill., assignor to Inland Steel Company, Chicago, Ill., a corporation of Delaware
Application January 29, 1934, Serial No. 708,904
10 Claims. (Cl. 61—34)

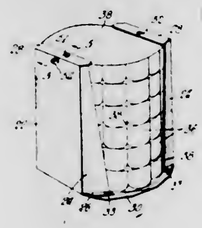
1. A structure of the character set forth, comprising walls spaced apart, and tension means for preventing spreading of said walls comprising members located at intervals along said walls and each extending crosswise thereof from one to the other of said walls, said members having swinging connection with one of said walls, about substantially vertical axes.



2,001,474
PROCESS OF TIN PLATING
Francis H. Snyder, Niagara Falls, N. Y., and Stanley F. M. Maclaren, Niagara Falls, Ontario, Canada, assignors to Industrial Research, Limited, Niagara Falls, Ontario, Canada, a corporation of Ontario
No Drawing. Application November 10, 1931, Serial No. 574,226
3 Claims. (Cl. 91—70.2)

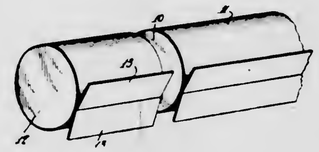
3. The process of manufacturing plated light guage metal sheets to be used in the manufacture of cans and the like which comprises cleaning the surface of the metal sheet under treatment, and applying a metal coating to the cleaned sheet by immersing the same in a molten bath of an alloy consisting of cadmium and tin, the cadmium constituting approximately from 1 to 10 per cent. by weight of said alloy.

2,001,475
PACKAGING AND HANDLING FROZEN COMESTIBLES OR THE LIKE
Clarence W. Vogt, Louisville, Ky., assignor, by mesne assignments, to Vogt Processes, Incorporated, Louisville, Ky., a corporation of Delaware
Application January 9, 1932, Serial No. 585,745
1 Claim. (Cl. 206—46)



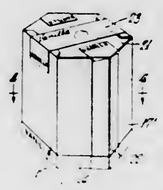
A shipping package of ice cream or other frozen comestible, including a plurality of substantially

cylindrical blocks of the frozen ice cream, each having substantially flat top and bottom end walls, wrapping material extending around the periphery of each block, a plurality of interleaves of non-absorbent sheet material disposed between successive layers and in direct contact with the top and bottom ends of the individual blocks, a casing enclosing all of said blocks and holding



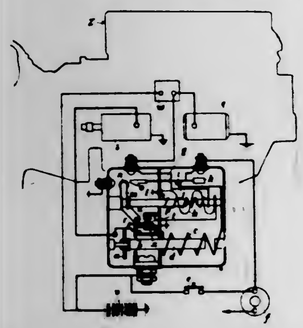
them in predetermined relative positions, said casing including a central tube of a diameter approximately equal to the diameter of one of said blocks and extending through the series of layers, end walls secured to the ends of said tube, and a wrapper encircling all of said blocks and having its opposite edges secured to said end walls to hold said blocks in assembled relationship between said end walls.

2,001,476
PACKAGE AND CONTAINER FOR ICE CREAM AND THE LIKE
Clarence W. Vogt, Louisville, Ky., assignor, by mesne assignments, to Vogt Processes, Incorporated, Louisville, Ky., a corporation of Delaware
Application August 22, 1932, Serial No. 629,776
9 Claims. (Cl. 206—46)



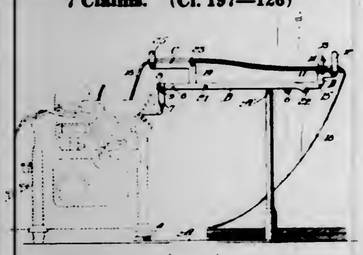
1. A container including a substantially hexagonal base of stiff sheet material and a pair of columns at opposite edges of said base, each column including a wall portion integral with said base and extending vertically therefrom, a pair of flanges integral with each wall at opposite side edges thereof and disposed in vertical planes at an angle of approximately 120° to the plane of the side wall and forming substantial portions of the other four walls, and means for securing the lower end of each flange to said base.

2,001,477
FROZEN COMESTIBLE PACKAGE
Clarence W. Vogt, Louisville, Ky., assignor, by mesne assignments, to Vogt Processes Incorporated, Louisville, Ky., a corporation of Delaware
Original application January 9, 1932, Serial No. 585,745. Divided and this application April 22, 1933, Serial No. 667,329
5 Claims. (Cl. 206—56)



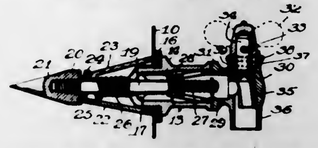
1. A new article of manufacture, comprising a substantially solid block of ice cream or the like, and a paper wrapper of greater length than the perimeter of the block and wrapped completely therearound, the two ends of the wrapper being folded away from each other and in opposite directions to form a pair of manually graspable spaced tabs.

2,001,478
SHIPPING PACKAGE
Clarence W. Vogt, Louisville, Ky., assignor, by mesne assignments, to Vogt Processes Incorporated, Louisville, Ky., a corporation of Delaware
Application February 1, 1934, Serial No. 709,245
15 Claims. (Cl. 206—46)



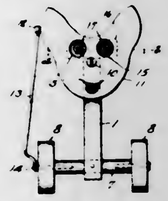
1. A shipping package of ice cream or other frozen comestible consisting of a plurality of superposed layers of blocks of frozen comestibles, each having a peripheral wrapping, a plurality of interleaves between the successive layers and serving as end walls for the wrappings of said blocks, and a casing enclosing all of said blocks and holding them in predetermined relative positions in said layers, and including a base member upon which said stack may be supported, a pair of oppositely projecting extensions integral with the base member and adapted to be folded upwardly into engagement with opposite sides of the stack to form side walls, each extension having side flanges bendable inwardly toward each other to form the remaining side walls, and a cover member upon the top of the stack secured to the upper ends of all of said side walls to prevent outward movement of the side walls and hold them in firm engagement with the stack.

2,001,479
AUTOMATIC STARTING MECHANISM FOR INTERNAL COMBUSTION ENGINES
Ernest Ansley Watson, Birmingham, England, assignor to Eclipse Machine Company, Elmira, N. Y., a corporation of New York
Application January 24, 1935, Serial No. 3,297
In Great Britain December 30, 1933
4 Claims. (Cl. 290—36)



1. An automatic starting system for internal combustion engines, including a battery, a starting motor circuit embodying an electromagnetic switch, a control circuit for said switch, a circuit in parallel with the starting motor circuit embodying electromagnetic means effective to open said control circuit, said last named circuit including a normally closed switch which opens and disconnects the electromagnetic opening means from the battery during cranking operation and is caused to close when the engine is running under its own power to cause energization of the opening electromagnetic means from the battery to open the control circuit and thereby open the electromagnetic switch.

2,001,480
TYPEWRITER ATTACHMENT
Charles L. Winter, Chicago, Ill., assignor to United Autographic Register Co., Chicago, Ill., a corporation of Illinois
Application September 19, 1934, Serial No. 744,716
7 Claims. (Cl. 197—126)

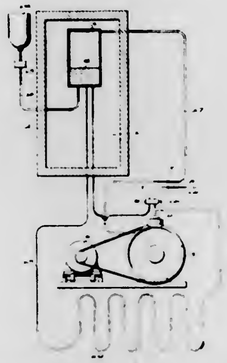


1. In combination with a typewriting machine equipped with strip-feeding mechanism: a forwardly movable carbon-holder disposed in rear of the strip-advancing mechanism; means for holding said carbon-holder in retracted position; and release-means for permitting forward movement of the carbon-holder, said release-means being depressible by the pressure of strips tensioned by said feed-mechanism.

2,001,481
DISPENSING ATTACHMENT FOR CANS
Scott M. Abbott, Chicago, Ill., assignor to Crane Packing Company, Chicago, Ill., a corporation of Illinois
Application July 16, 1934, Serial No. 735,508
14 Claims. (Cl. 221—23)

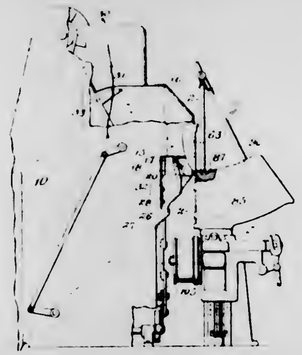
1. A dispensing attachment comprising a hollow body having a sharp inner end whereby said body may be pushed part way into a container when said sharp end is forced through the wall of said container, a movable abutment associated with the portion of said body which penetrates said wall and means on the outer portion of said body for moving said abutment away from and toward the longitudinal axis of said body, independently of the inward movement of said body through said wall, and after the completion of said movement.

2,001,482
ANIMATED TOY
Martin Beerline, Findlay, Ohio
Application November 9, 1934, Serial No. 752,345
1 Claim. (Cl. 46—40)



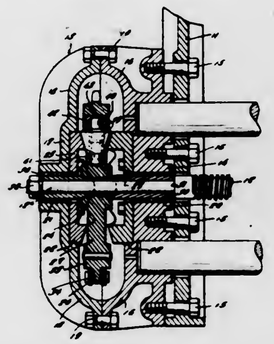
An animated toy including a wheel supported body, a head mounted for oscillation on one end of the body and extending transversely of the body, there being eye openings within the head, means fixedly mounted on the body for closing the openings, there being representations of eyeballs on said means, and means operated by one of the wheels when rotated for oscillating the head.

2,001,483
METHOD OF MAKING JEWELRY CHAINS
Frederick W. Bopp, Providence, R. I.
Application February 4, 1935, Serial No. 4,979
1 Claim. (Cl. 59—35)



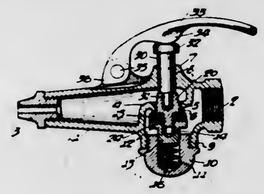
The herein described method of forming a tube chain consisting in placing a long tube over a chain, then cutting the tube into short lengths by spinning operations which press the metal at the ends of the short lengths inwardly to form interior projections at the ends of the short lengths, said projections engaging portions of the chain.

2,001,484
SYSTEM FOR TEMPERATURE CONTROL
Henry Holland Buckman, Jacksonville, Fla., assignor to Buckman and Company, Jacksonville, Fla., a corporation of Florida
Application March 14, 1931, Serial No. 522,759
3 Claims. (Cl. 62—1)



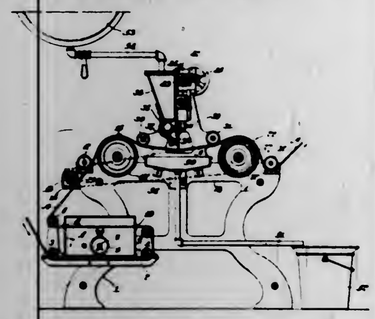
1. In a combined refrigerator and gas generator, a refrigerating unit, a gas generator unit, a common fluid supply means for operating both units, and means for varying the supply of fluid to one of said units independently of the operation of the other of said units.

2,001,485
SPILLAGE DEVICE FOR BAG FILLING MACHINES
Austin S. Chandler, Fitchburg, Mass., assignor to The Brown Bag Filling Machine Company, Fitchburg, Mass., a corporation of Massachusetts
Application October 3, 1934, Serial No. 746,733
7 Claims. (Cl. 226—49)



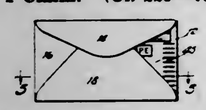
1. A charge spiller for bag filling machines and the like comprising a charge delivering means, bag presenting means to move part of an open bag into receiving relation thereto, a charge diverter movable into receiving relation to the charge delivering means, yielding means to hold the diverter in receiving position, said diverter being located in the path of a bag part to receiving position, whereby the diverter will be moved out of receiving position by such bag.

2,001,486
WARP-BEAMING MACHINE
Victor J. Diefenderfer and Alphonse C. Lova, Allentown, Pa.
Application February 26, 1934, Serial No. 713,038
2 Claims. (Cl. 28—37)



1. In a warp-beaming machine, a beam core, a driving member mounted on one end of the beam core, said beam core being mounted for rotation and for longitudinal reciprocatory movement in its bearings, relatively fixed cam plates at opposite sides of the driving member, and roller means carried by the driving member on axes disposed at right angles to the beam core and engaging in alternations successive cams for causing the beam core to reciprocate a number of times during each rotation thereof.

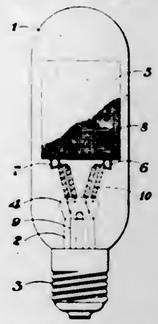
2,001,487
THROTTLE VALVE
Harold F. Doherty, Bridgeport, Conn., assignor to Jenkins Bros., New York, N. Y., a corporation of New Jersey
Application May 5, 1933, Serial No. 669,601
5 Claims. (Cl. 251—134)



1. A throttle valve, comprising a casing having an apertured diaphragm forming a valve seat, a valve head guided in said casing and cooperable with the valve seat, a spring normally seating the head, a stem guided in said casing for moving the head away from the seat, and an adapter interposed between the stem and the head, said adapter being displaceable laterally with respect to the stem and head to accommodate itself to the aperture in the diaphragm and being of a form to provide a restricted opening between its periphery and the wall of said aperture during the first part of the opening movement of the head and to afford an increasingly larger opening during the latter part of the opening movement of said head.

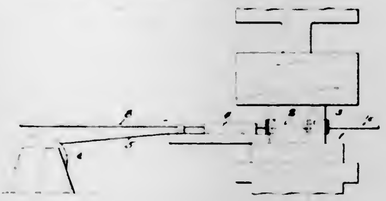
2,001,488
APPARATUS FOR COATING FABRICS
Albert W. Drobile, Cynwyd, Pa.
Application March 7, 1930, Serial No. 433,907
8 Claims. (Cl. 91—53)

1. Apparatus of the character described comprising a humidifier, a brush to which fabric passes from said humidifier, a plurality of card clothing rollers to which fabric passes from said brush, a blade disposed between such card clothing rollers for engaging a fabric supported thereby, and a presser disposed between said blade and one of said card clothing rollers.



2,001,489
COMBINED MAILING AND RETURN ENVELOPE
Harry Elbaum, New York, N. Y.
Application September 5, 1934, Serial No. 742,746
1 Claim. (Cl. 229—73)

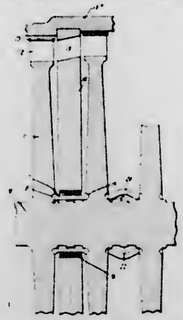
A combined mailing and return envelope comprising two individual envelopes formed of a single blank, each of said envelopes including a body and flap portions, said mailing envelope being larger for receiving the return envelope, the body portions of said envelopes being connected along one edge and provided with a row of perforations forming both the line of severance and line of fold of said envelopes for folding the return envelope in the mailing envelope, one of the flaps of said return envelope being sealed adjacent the line of perforations, the flaps of the mailing envelope cooperating when folded upon its body to cover the major portion of the return envelope and to seal the same in the mailing envelope, the uncovered portion of the return envelope providing a finger gripping area to facilitate its removal in unsevered condition upon the opening of either the top or bottom flaps of the mailing envelope.



2,001,490
GASEOUS ELECTRIC DISCHARGE DEVICE
Georg Gaidies, Berlin-Pankow, Germany, assignor to General Electric Company, a corporation of New York
Application June 27, 1932, Serial No. 619,575
In Germany July 13, 1931
4 Claims. (Cl. 176—124)

1. An electric discharge device consisting of a container, electrodes sealed therein, a gaseous atmosphere therein, at least one of said electrodes being a metal plate anode, another of said electrodes being a wire net in front of said anode cathode, said electrodes being flat and in parallel

positions in said container and supporting a luminous electric discharge in said gaseous atmosphere and means for charging said plate anode positively and said net cathode negatively.



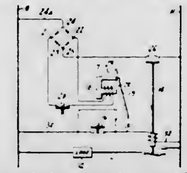
2,001,491
PROCESS OF AND APPARATUS FOR MARKING
Fred Hendey, Passaic, N. J., assignor to The Okonite Company, Passaic, N. J., a corporation of New Jersey
Application December 23, 1932, Serial No. 648,568
6 Claims. (Cl. 18—13)

1. The method of applying discontinuous markings to the insulation of electric cables, cords and the like insulated with a soft compound, which method comprises enveloping the article in a strip of smooth material having the desired discontinuous marking impressed therein in definite spaced relation and then extruding a lead sheath with a smooth interior surface about the enveloped article to provide discontinuous markings to the insulation of the article in predetermined spaced relation to each other.

2,001,492
METHOD OF ASSEMBLING PACKING RINGS IN TURBINE ROTORS
Fritz Herrlinger, Berlin, Germany, assignor to General Electric Company, a corporation of New York
Application November 14, 1933, Serial No. 697,934
In Germany May 16, 1933
2 Claims. (Cl. 29—156.8)

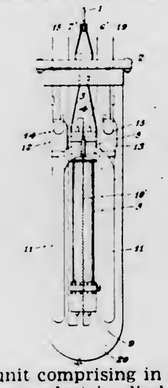
1. In an elastic fluid turbine having a rotor with wheels integrally formed with the shaft and a diaphragm intermediate adjacent wheels, the method of assembling a packing ring intermediate the shaft and a packing surface on the diaphragm which method comprises inserting a plurality of ring segments in V-shaped form in opposite grooves in the adjacent sur-

faces of the wheels and forcing the V-shaped portions of the segments inwardly whereby the segments assume a cylindrical shape.



2,001,493
LATCHING MEANS FOR LOCKERS AND THE LIKE
Samuel N. Hope, Wauwatosa, Wis., assignor to Dudley Lock Corporation, Chicago, Ill., a corporation of Illinois
Application April 20, 1931, Serial No. 531,431
11 Claims. (Cl. 70—14)

11. The combination with a door and door frame, of a movable latching member for securing the door in closed position, and a lock having means to automatically secure the latching member in latching position upon said member being moved to such position, said means including a bolt having a portion to directly engage said latching member, said bolt being spring-projected to maintain it in operative relation to the latching member, so that movement of said latching member will move said bolt to unlocked position when released, and return of the latching member to latching position will permit return of the bolt to locking position.

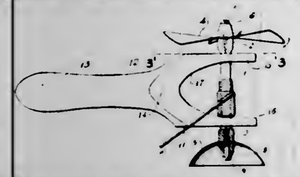


2,001,494
TIME DELAY UNDERVOLTAGE PROTECTIVE SYSTEM
Benjamin W. Jones, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application October 19, 1933, Serial No. 694,275
13 Claims. (Cl. 175—294)

1. An undervoltage protective system for an alternating current device, comprising a relay provided with a magnetizable frame and a magnetizable armature normally biased from an attracted to an unattracted position, an operating coil for said relay, a rectifier, connecting means for connecting said coil and said rectifier in series in an energizing circuit for operating said armature to its attracted position, and connecting means also providing a normally closed circuit for said

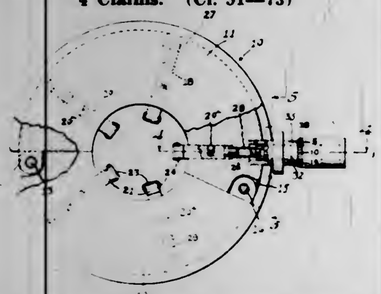
coil for maintaining said armature in said attracted position a predetermined time after the occurrence of a predetermined reduction in the voltage of said energizing circuit, means for opening said coil circuit for instant operation of said relay, and means responsive to the operation of said armature from one to the other of said positions for controlling the energization of said alternating current device.

2,001,495
LAMP UNIT
Hermann Krefft, Berlin-Friedrichshagen, Germany, assignor to General Electric Company, a corporation of New York
Application March 5, 1934, Serial No. 714,161
In Germany March 15, 1933
4 Claims. (Cl. 240—11.4)



1. A lamp unit comprising in combination, two or more gaseous electric discharge lamps, one of said lamps being a low pressure metal vapor lamp and another of said lamps being a high pressure metal vapor lamp, said low pressure lamp surrounding said high pressure lamp, said lamps being mounted in adjacent, parallel positions, said high pressure lamp heating said low pressure lamp.

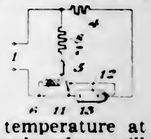
2,001,496
FLYING TOY MECHANISM
Walter Kroelling, Cleveland Heights, Ohio
Application January 23, 1934, Serial No. 707,899
1 Claim. (Cl. 46—51)



An apparatus of the character described having in combination a shaft having a central portion of reduced cross section providing spaced circumferential beveled shoulders at intermediate positions on said shaft, a propelling member secured

to one end of said shaft, a stabilizing member secured to the other end of said shaft, a launching device adapted to be engaged over said reduced central portion of said shaft in equally spaced relation to the propelling member and the stabilizing member, said launching device providing

a handle section at one end and a shaft engaging section comprising members formed with two intersecting slots at right angles to each other, the arms on each side of said respective vertical slots engaging at their outer edges against said intermediate beveled shoulders on said shaft.

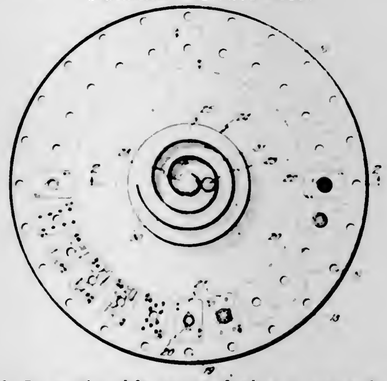


2,001,497
GRINDING DEVICE
Ervin F. Lawhorn and Sherman R. Brenaman, Lanark, Ill.
Application June 15, 1934, Serial No. 730,694
4 Claims. (Cl. 51—73)

1. A rotatable grinding device for shafts comprising arcuate holder sections arranged to be placed around the shaft to be ground, means for securing said sections in ring form about the shaft, a plurality of radially disposed slots opening in the inner periphery of said holder, a slidable member disposed in each of said slots and retained thereby against relative rotation therein and having grinding means at the inner ends thereof, threaded means for adjusting said slidable members axially and into contact with the surface of the shaft and a gauging-actuating device for actuating said threaded means to effect the adjustment of said grinding means to predetermined and indicated radial positions.

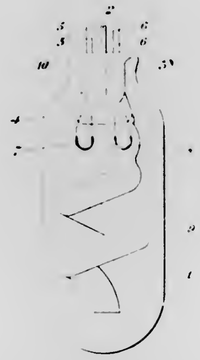
2,001,498
ELECTRIC TRANSLATING DEVICE
Wilfried Meyer, Berlin-Steglitz, and Erwin Weise, Berlin, Germany, assignors to General Electric Company, a corporation of New York
Application December 7, 1934, Serial No. 756,438
In Germany December 22, 1933
6 Claims. (Cl. 176—124)

6. In combination, an electric gaseous discharge device having a thermionic cathode, a heater therefor, and another electrode, means to connect said device to a source of energy through said heater, a by-pass connection between said cathode and said other electrode whereby the potential is reduced to a value less than that necessary to initiate a discharge therebetween and a heating current is passed through said heater, and means to open said by-pass after said cathode



has reached a temperature at which the free electron emission therefrom will support the normal discharge current.

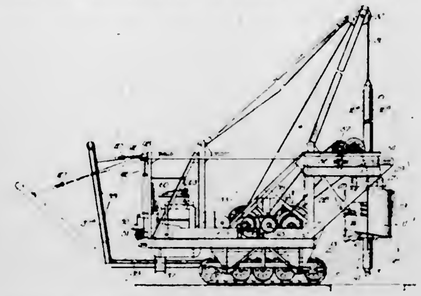
2,001,499
DISPLAY DEVICE
Richard Eaton Paige, Flushing, N. Y.
Application December 4, 1934, Serial No. 755,859
13 Claims. (Cl. 40—126)



1. A display device comprising in combination, a main display element, a prop for said main display element, and a circumflexed secondary display element embracing a portion of said prop and having interlocking engagement therewith to maintain the secondary display in circumflexed form.

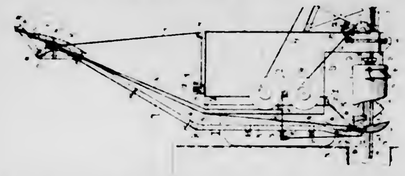
2,001,500
GAME DEVICE
Charles J. Rothen, New York, N. Y.
Application October 9, 1934, Serial No. 747,544
3 Claims. (Cl. 273—138)

1. In a pinochle game device, a game board, the top of which constitutes a playing area, an upstanding wall extending about said game board, an annular series of openings or recesses provided in the playing area identified by different playing card value indicia identical to that of the respective cards of a set of pinochle playing cards, a rotary ball projector mounted centrally of said game board, and a set of play balls adapted to be individually propelled over the playing area by said rotary ball projector, one of said set of play balls being distinguishable from the other and adapted to be placed upon said rotary projector before the others and projected therefrom over said play area to enter any of said openings to determine the trump suit during the succeeding individual projection of the other play balls.



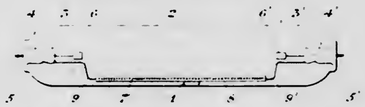
2,001,501
GASEOUS ELECTRIC DISCHARGE DEVICE
Alfred Rüttenauer, Berlin-Halensee, and Otto Fritze, Berlin, Germany, assignors to General Electric Company, a corporation of New York
Application February 23, 1934, Serial No. 712,651
In Germany March 10, 1933
1 Claim. (Cl. 176—122)

A gaseous electric discharge device comprising an elongated, tubular container having substantially the same diameter throughout the length thereof, one end of said container being hemispherical and a stem at the other end of said container, a gaseous atmosphere in said container comprising a vaporizable material, a pair of thermionic electrodes sealed into said stem, said electrodes being adjacent each other and a helically shaped, light transmitting tube fused to said stem and surrounding one of said electrodes, the inside diameter of said tube being substantially smaller than the inside diameter of said container and opening adjacent the spherical end of said container, the outside of the helix formed by said tube closely approaching the wall of said container.



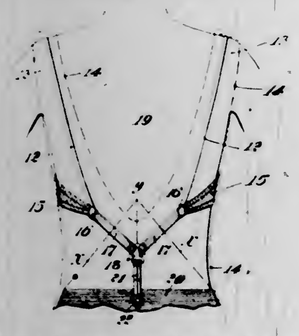
2,001,502
EXCAVATING, HOISTING, DUMPING, AND CONVEYING APPARATUS
Hilmar E. Satre, Chicago, Ill., assignor, by mesne assignments, to Spencer, White & Prentis, Incorporated, New York, N. Y., a corporation of Connecticut
Application May 5, 1934, Serial No. 724,129
12 Claims. (Cl. 255—21)

1. In a machine for digging caisson holes and the like, the combination of an earth auger adapted to dig the hole and receive the excavated earth, means for lifting said earth auger with a charge of excavated earth to a distance above the surface of the ground, a conveyor for receiving said charge of earth and delivering it at a remote point of disposal, and a single power unit for



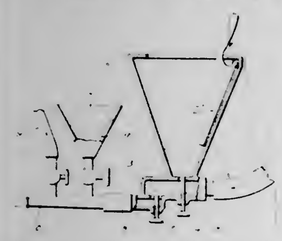
operating said auger and conveyor in timed successive and concurrent relation.

2,001,503
EXCAVATING AND CONVEYING MACHINE
Hilmar E. Satre, Chicago, Ill., assignor, by mesne assignments, to Spencer, White & Prentis, Incorporated, New York, N. Y., a corporation of Connecticut
Application May 5, 1934, Serial No. 724,131
6 Claims. (Cl. 255—21)



3. In an excavating machine, the combination with a digging device for digging and dumping excavated material, and a lead shaft therefor, of a conveyor device including a car movable along a track to and from a position beneath the elevated digging device, said car when beneath the elevated digging device occupying a position above the open mouth of the excavation against the entry thereto of material discharged by the digging device.

2,001,504
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Rudolf Schmidt, Weisswasser, Germany, assignor to General Electric Company, a corporation of New York
Application February 23, 1934, Serial No. 712,617
In Germany March 8, 1933
6 Claims. (Cl. 176—122)

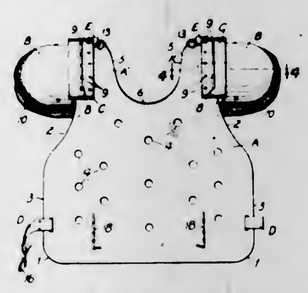


1. An electric discharge lamp device comprising a container, electrodes sealed therein, a gaseous atmosphere therein consisting of mercury vapor, said container consisting of a glass comprising 4 to 18% boric acid, 3 to 10% alkali earth material and 15 to 22% alkali material, more than two-thirds of said alkali material being potassium oxide.

2,001,505
BRASSIÈRE BACK CONNECTIONS FOR EVENING ATTIRE
Henry Schottenfels, West New York, N. J.; Monroe Schottenfels and Fred A. Mack, executors of said Henry Schottenfels, deceased, assignors to Monroe Schottenfels, West New York, N. J.
Application December 16, 1933, Serial No. 702,657
4 Claims. (Cl. 2—42)

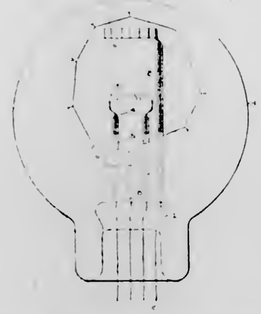
1. Brassière back connections adapted to be hid behind the material of an evening gown and to be held out of the open-back area of such gown, in combination with a girdle foundation, comprising shoulder straps and underarm side pieces connected with the body of the brassière and having at their back ends permanently connected elastic strip terminals common thereto, a central coupling device having adjacent its top portion downwardly and oppositely inclined hook arms with which the strip terminals are detachably connected under definite tension, and a pull-down connection between the lower portion of the coupling device and the girdle foundation below it, said hook arms being effective to establish tensioned strip terminals in definitely balanced equilibrium and prevent movement of the parts into the open back area of the gown.

2,001,506
ARSENIC-CONTAINING CEMENT
Gösta Johan Jakob Smitt, Vasteras, Sweden, assignor to Bolidens Gruvaktiebolag, Stockholm, Sweden
Application October 28, 1933, Serial No. 695,666
In Sweden November 2, 1932
4 Claims. (Cl. 106—24)



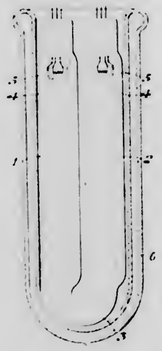
1. Process for treating cement or a mixture thereof, which consists in ejecting said cement or cement mixture by means of gas pressure in order to apply the same, and simultaneously adding to the cement or mixture during ejection thereof, a supply of material including a compound of arsenic capable of reacting with part of said cement and preferably in a finely divided form immediately adjacent to the point of ejection of said cement or cement mixture.

2,001,507
LATCH MECHANISM
John W. Stribling, Detroit, Mich., assignor to George Hunt, Detroit, Mich.
Application August 16, 1934, Serial No. 740,105
10 Claims. (Cl. 217—60)



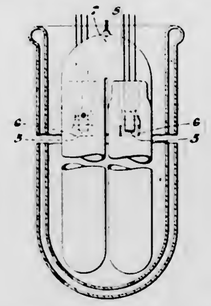
1. A latch mechanism comprising, in combination, a pair of members connected together for movement relative to each other, ratchet teeth fixed to one of said members, and a dog pivotally mounted on the other of said members in a position to be engageable with said teeth within a predetermined range of movement between said members, means acting on said dog tending to move it toward a neutral position, the first mentioned member having means so constructed and arranged relative to said dog and ratchet teeth as to cause said dog to pivot between operative and inoperative positions upon reversal of movement of said members after relative movement thereof in either direction beyond said predetermined range of movement.

2,001,508
PROTECTING DEVICE FOR BASEBALL UMPIRES
Claude R. Tobin, St. Louis, Mo.
Application April 30, 1934, Serial No. 723,055
7 Claims. (Cl. 2—2)



1. An athletic protecting device, comprising a substantially rigid and inflexible shield formed by a single member that extends unbrokenly across the user's chest and downwardly over the user's abdomen, substantially rigid collar bone protectors at the upper end of said shield that extend over the user's collar bones and terminate at the rear side of same, shoulder cap guards hinged or pivotally connected to said collar bone protectors, and means for holding said shield in operative position on the user's body.

2,001,509
ELECTRIC DISCHARGE APPARATUS
Willem Uyterhoeven, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York
Application July 3, 1933, Serial No. 678,952
In the Netherlands June 30, 1932
7 Claims. (Cl. 176—122)

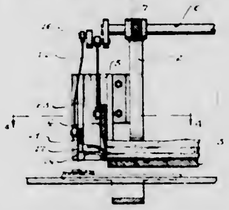


1. An electric discharge device comprising an envelope containing a cathode coated with electronically active material, an anode and an ionizable material, said anode being circular and having a corrugated surface, said anode and said cathode being separated an appreciable distance, the length of the corrugations in said anode extending toward said cathode to collect the material emanating from said cathode.

2,001,510
LAMP UNIT
Willem Uyterhoeven and Cornelis Verburg, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York
Application March 16, 1934, Serial No. 715,951
In Germany April 4, 1933
4 Claims. (Cl. 176—122)

1. A lamp unit comprising in combination, a gaseous electric discharge lamp device comprising an elongated, tubular sealed container, a gaseous atmosphere therein comprising a metal vapor, electrodes sealed therein, a heat conservator in operative relation to said lamp device, said container having straight parts and a curved part connecting said straight parts, the inside diameter of said curved part being less than the internal diameter of said straight parts.

2,001,511
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Willem Uyterhoeven and Mari Johan Druyvesteyn, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York
Application March 30, 1934, Serial No. 718,241
In Germany April 3, 1933
4 Claims. (Cl. 176—122)



1. A lamp unit comprising in combination, a heat conservator, a gaseous electric discharge lamp device mounted in said conservator, said lamp device comprising an elongated, tubular container having parallel parts, electrodes sealed therein and a gaseous atmosphere therein comprising the vapor of a difficultly vaporizable material, the distance between the parallel parts of the container and the distance between the container and said conservator being such that the utilization factor is greater than

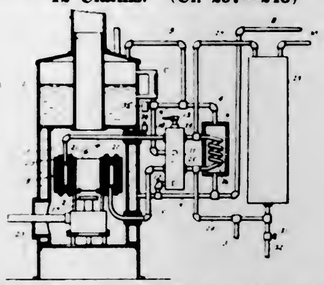
$$\frac{1}{n}$$

where n represents the number of parallel parts.

2,001,512
SLICING MACHINE
Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
Application September 29, 1932, Serial No. 635,382
21 Claims. (Cl. 146—159)

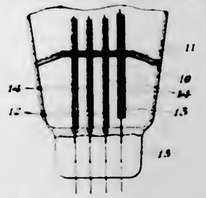
19. In a meat slab slicing machine, the combination with means for the feed of a slab of meat, a cutting element, and a receiving means for cut slices of the slab, of means to control the motion of a cut slice from the slab from the time the knife starts to cut it from the slab until it comes to rest on the receiving means, including a deflecting member carried by the knife to deflect and move the slice as it is being cut to a substantially horizontal slightly curved position, and an ejecting means operable from above the deflecting member to engage the cut slice to transfer the same to said receiving means.

2,001,513
CIRCUIT BREAKER
Ernest Zurcher, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application June 27, 1933, Serial No. 677,795
14 Claims. (Cl. 200—124)



10. A circuit controlling device comprising a base member formed of insulating material and provided with ledges laterally spaced apart one from the other, a pair of fixed contacts spaced apart from each other and fastened to each of said ledges, an arc housing formed of insulating material and provided with partitions extending between said ledges and with side walls overlapping said ledges on all four sides thereof to provide flame-proof chambers for each pair of said contacts, a bridging contact mounted on said arc housing between said partitions and said side walls for movement therewith into and out of bridging circuit controlling positions with said fixed contacts, and means for operating said arc housing between said positions.

2,001,514
HIGH FREQUENCY TRANSMISSION SYSTEM FOR RAILWAYS
Ernst F. W. Alexanderson, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application August 20, 1931, Serial No. 558,288
11 Claims. (Cl. 177—352)

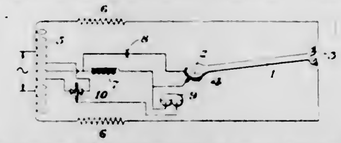


1. The combination, in a railway signal system, of a track, a continuous conductor extending along the track, a plurality of impedance means of substantially equal value permanently connecting said conductor with a rail of said track at substantially uniformly spaced intervals along the track, and means for transmitting energy from a vehicle to said rail and for receiving energy from said rail, said impedance means being so designed with relation to the distributed line constants that substantially all of the energy transfer between said rail and conductor occurs through said impedances.

2,001,515
WATER HEATER
James T. Barrow, New York, N. Y.
Application June 18, 1934, Serial No. 731,214
12 Claims. (Cl. 257—248)

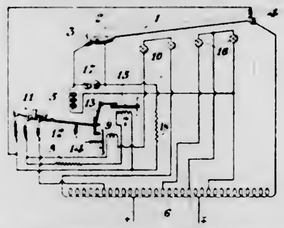
1. A heating element for a water heating system, comprising two hollow semicircular members, angular lugs on the ends of said members, the lugs on one end of each member being smaller than the lugs on the other end, the larger lugs being adapted to slidably fit over the smaller lugs, thereby joining together said members into a ring-shaped container with an annular chamber inside, closing members for the sides of said ring at the joints formed by said lugs, means to tighten said closing members against said joints thereby rendering said joints leakproof, means for supporting said heating element inside of the furnace of a boiler above the burner of said furnace, and an inlet and an outlet in said container for connection with water pipes.

2,001,516
GASEOUS ELECTRIC DISCHARGE DEVICE
Cornelis Bol, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York
Application May 16, 1933, Serial No. 671,318
In the Netherlands June 30, 1932
7 Claims. (Cl. 176—122)



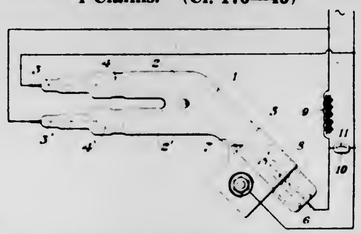
5. An electric discharge device comprising a container, electrodes and electrode leads sealed therein, a gaseous atmosphere therein, a stem fused to said container, a septum between the part of said container surrounding the discharge path between said electrodes and the stem part of said container, a tube of small diameter extending through said septum, said tube surrounding one of said electrode leads and having an inside diameter larger than the diameter of said lead.

2,001,517
METHOD OF AND APPARATUS FOR STARTING ELECTRIC DISCHARGE DEVICES
Leroy J. Buttolph, Grantwood, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey
Application October 24, 1931, Serial No. 570,959
17 Claims. (Cl. 176—45)



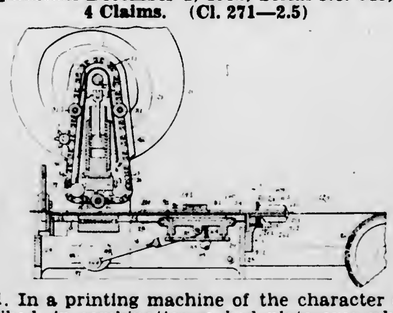
1. In combination, an electric gaseous discharge device having electrodes, means to apply

an operating potential between said electrodes, an inductance connected to one of said electrodes, a source of uni-directional current connected across said inductance independently of said dis-



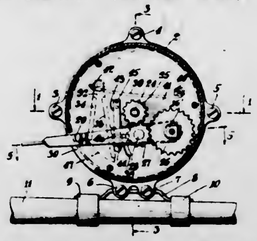
charge device, the potential of said source being materially less than that applied between said electrodes, and means to interrupt current flow from said source through said inductance.

2,001,518
METHOD AND APPARATUS FOR STARTING AND OPERATING GASEOUS ELECTRIC DISCHARGE DEVICES
Leroy J. Buttolph, Grantwood, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey
Application July 26, 1932, Serial No. 624,838
10 Claims. (Cl. 176—45)



1. In combination, an electric gaseous discharge device, a ballast resistance connected in series therewith, an incandescent lamp, means to substitute said lamp for said resistance, and means to preheat the filament of said incandescent lamp before it is connected in series with said device.

2,001,519
ELECTRIC DISCHARGE DEVICE AND METHOD OF OPERATING SAME
Leroy J. Buttolph, Grantwood, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey
Application May 12, 1933, Serial No. 670,772
4 Claims. (Cl. 176—45)

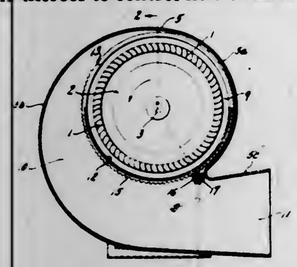


1. In combination, an electric gaseous discharge lamp of the rectifying type having an elongated arc tube, a cathode at one end thereof, and a pair of anodes at the opposite end of said arc tube, the paths from said cathode to said anodes being of unequal length, means to connect a source of alternating current between said anodes, and a connection including an inductance between said cathode and the anode which is nearer said cathode.

2,001,520
PRINTING MACHINE
Johan A. Carlson, Ashland, Mass., assignor to Lucy F. Pratt, Ashland, Mass.
Application December 1, 1932, Serial No. 645,210
4 Claims. (Cl. 271—2.5)

1. In a printing machine of the character described, in combination, a bed plate over which is fed a strip or web strung with strings and provided with notches, a feed mechanism having means movable into and out of said notches for effecting intermittent feed of said strip or web, and a cover plate co-operating with said bed plate to form a guideway for said strip or web, said cover plate being provided with an opening with which a notch in the strip or web is capable of being registered to position the notches in the strip or web in proper position to be entered by said feeding means.

2,001,521
FISHING REEL
Edward C. Cattley, Brooklyn, N. Y.
Application December 3, 1934, Serial No. 755,684
11 Claims. (Cl. 242—84.5)



2. In a reel, a spool having a flange, a rod, a winding apparatus and a control therefor, a device for rendering at will the winding apparatus effective or ineffective, a braking means for engaging the surface of said spool flange, a single control lever for operating said device and said braking means adapted to be operated by the same hand employed in supporting the rod.

2,001,522
CENTRIFUGAL BLOWER
Thomas Chester, Detroit, Mich.
Application May 3, 1932, Serial No. 608,950
14 Claims. (Cl. 230—114)

14. In a blower of the class described and having a rotatable impeller with radially-shallow curved forwardly-inclined blades having their cavities in the direction of impeller rotation and a housing therefor having a volute collector part leading to a discharge mouth, cylindrical mask means disposed in said housing to provide an annular vortex chamber of substantial radial dimension about said impeller, said mask means

having port means and being arranged for adjustment thereof to control flow from said vortex

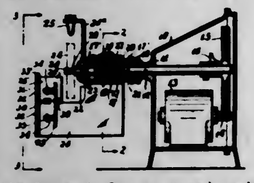
chamber to said volute collector part of the housing.

2,001,523

HYDROXY DIPHENYL INTERMEDIATES

Walter G. Christiansen, Glen Ridge, N. J., and Sidney E. Harris, Lynbrook, N. Y., assignors to E. R. Squibb & Sons, New York, N. Y., a corporation of New York

No Drawing. Application June 3, 1933, Serial No. 674,212
1 Claim. (Cl. 260—143)



2-hydroxy 4'-nitro diphenyl.

2,001,524

ATTACHMENT FOR MEAT GRINDING MACHINES

David Cohen, New York, N. Y.

Application February 12, 1934, Serial No. 710,765
11 Claims. (Cl. 146—77)

2. An attachment for a meat grinding machine, comprising a tubular member for attachment on the body of the grinding machine axially with the drive shaft, a shaft rotative through said tubular member and having its inner end equipped with a coupling element for connection with said drive shaft and having its outer end equipped with an element for receiving and holding a tool, a platform having a tubular portion on one edge thereof engaging said tubular member, and means for holding said tubular portions in various fixed positions for holding the platform in various or inoperative positions, clamping screws threadedly engaging said tubular member for engaging against the body of the grinding machine to clamp the tubular member in position.

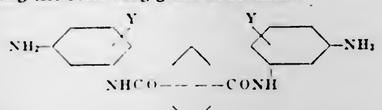
2,001,525

RESINOUS AND VARNISH COMPOSITION AND PROCESS FOR PREPARATION THEREOF

Roy E. Coleman, Meriden, Conn., assignor to General Electric Company, a corporation of New York

No Drawing. Application October 27, 1932, Serial No. 639,847
2 Claims. (Cl. 134—26)

1. The process of making a varnish composition which comprises heating China wood oil at an elevated temperature with about 2 to 10% by weight of boric acid, adding an oil-soluble synthetic resin of the class consisting of oil-soluble phenolic and alkyd resins, and continuing the heating until a homogeneous blend is obtained.



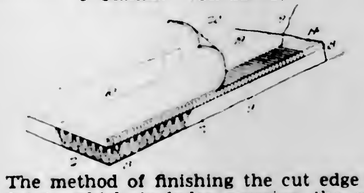
2,001,526

AZO DYES AND METHOD FOR THEIR PREPARATION

Miles Augustinus Dahlen, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 30, 1933, Serial No. 663,551
12 Claims. (Cl. 260—77)

6. A process for making insoluble azo dyes which comprises tetrazotizing and coupling a diamine having the following general formula:



in which Y represents a hydrogen, halogen, alkyl or alkoxy group, with an arylamide of 2,3-hydroxy-naphthoic acid, wherein the arylamide is derived from an arylamine selected from the group consisting of amino-benzenes and amino-naphthalenes.

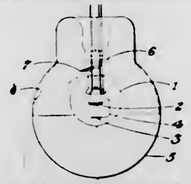
2,001,527

CONSTRUCTION OF RUGS OF PILE FABRICS

Charles Herbert Davison, Edgerstoune, Princeton, N. J.

Application January 11, 1935, Serial No. 1,313
5 Claims. (Cl. 28—1)

1. The method of finishing the cut edge of a pile fabric which includes severing the entire fabric, both backing and pile tufts, without loss of the material of either; overcasting the backing wefts at and immediately adjoining said cut edge with stitches of thread extending over the backing at the roots ot the pile tufts, and encircling said wefts at the back and cut edge of the fabric so as to bind the edge of the fabric and prevent raveling thereof; coating the back of the fabric with elastic cement overlying said overcast stitches and an adjoining strip of the fabric backing; and covering said cement with a flat band of tough material secured parallel with the plane of the fabric by said adhesive and with one edge of said band flush with the cut edge of the fabric.



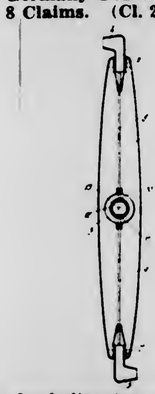
2,001,528

GASEOUS ELECTRIC DISCHARGE DEVICE

Willem de Groot and Mari Johan Druyvesteyn, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York

Application September 14, 1932, Serial No. 633,144
In the Netherlands September 18, 1931
5 Claims. (Cl. 176—122)

1. An electric discharge device comprising a container, electrodes sealed therein, a gaseous atmosphere therein comprising a condensible metal vapor, and an envelope surrounding said container, a film of metal interposed between the



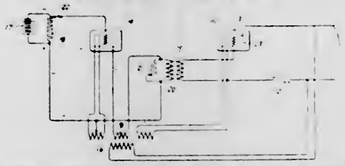
inner wall of said envelope and the outer wall of said container and adapted to reflect the infra-red radiations back to said container to prevent condensation of said metal vapor.

2,001,529

ROTOR FOR HELICOPTERS

Claude Dornier, Friedrichshafen-on-the-Bodensee, Germany

Application January 22, 1934, Serial No. 707,831
In Germany February 2, 1933
8 Claims. (Cl. 244—18)



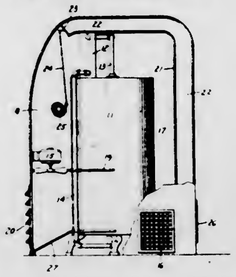
1. A rotor for helicopters comprising a pair of airfoils mounted for rotation about a common axis and formed with axial gas passages, a reaction nozzle mounted at the outer end of each airfoil for adjustment about an axis substantially parallel to the longitudinal axis of said airfoil, and means for adjusting each nozzle.

2,001,530

ELECTRIC DISCHARGE DEVICE SYSTEM

George W. Garman, Scotia, N. Y., assignor to General Electric Company, a corporation of New York

Application March 20, 1930, Serial No. 437,627
6 Claims. (Cl. 250—27)



4. The combination of a vapor electric discharge device provided with a grid for controlling the starting of current between its cathode and anode, a circuit for applying an alternating potential to said grid including a source of alternating current, and a space discharge device connected in series with one winding of a transformer, the other transformer winding being connected to said grid, and means for varying the impedance of said space discharge device variably to distort the wave form of said alternating potential.

2,001,531

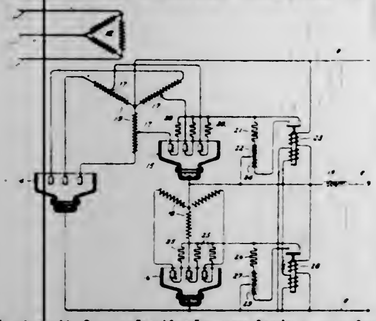
HEATING APPARATUS

Chester I. Hall, Philadelphia, Pa., assignor, by mesne assignments, to General Electric Company, a corporation of New York

Application February 18, 1932, Serial No. 593,785
2 Claims. (Cl. 237—2)

1. A room air heating unit comprising an enclosing casing having its bottom near the floor and provided with spaced apart openings adjacent the bottom thereof for admitting and exhausting air, a high temperature heat storage means mounted within said casing to provide a vertical dividing wall between said openings, a radiator mounted at the top of said heat storage means and connected to be heated thereby, means including a fan for circulating air through one of said openings at one side of said wall over said radiator to be heated to a high temperature and exhausted through the other opening, a mixing chamber for receiving the air after passing over said radiator, an air duct in the casing for conducting air at room temperature through an opening at said one side of said wall to said mixing chamber, a valve controlling the admission of said room temperature air through said air duct to said mixing chamber, and a thermostatic element responsive to the temperature of the air in said mixing chamber for controlling said valve to provide an air mixture of a predetermined temperature in said mixing chamber.

2,001,532



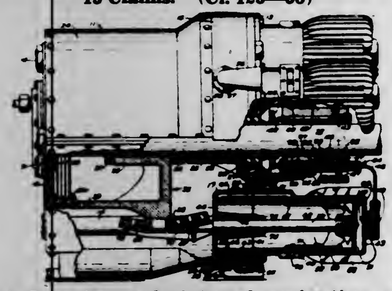
SYSTEM OF ELECTRICAL DISTRIBUTION

Helmut Hintze, Kopenich-Wendenschloss, Germany, assignor to General Electric Company, a corporation of New York

Application September 5, 1933, Serial No. 688,264
In Germany September 26, 1932
5 Claims. (Cl. 171—97)

5. In a system of electrical distribution, a three-wire Edison direct-current load circuit, a source of direct current connected to the outer terminals of said load circuit, a source of alternating current, an auxiliary full-wave rectifier including a transformer network energized from said alternating current circuit and provided with an electrical midpoint connected to the neutral of said load circuit, a group of electric valves interconnecting the several terminals of said network with the positive side of said direct-current circuit, a group of valves interconnecting the several terminals of said network with

the negative side of said load circuit, and means responsive to an electrical unbalance of said

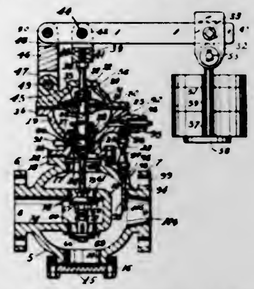


load circuit for selectively rendering conductive only one of said groups of valves.

2,001,533

INTERNAL COMBUSTION ENGINE

Herbert W. Houston, North Hollywood, Calif.
Application July 20, 1929, Serial No. 379,772
15 Claims. (Cl. 123—58)



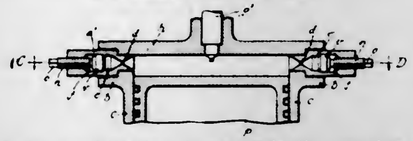
14. In a two-cycle internal-combustion cam-engine, the combination of: a crank shaft, a cylinder having an exhaust port and an intake port; a piston slidable in said cylinder parallel with said shaft through successive compression and power strokes and adapted to open said ports at the end of a power stroke and to close said ports at the beginning of a succeeding compression stroke; and a cam for controlling the movement of said piston, said cam having a power portion cooperating with said piston during an expansion stroke thereof, a compression portion for moving said piston through a compression stroke, and an intermediate exhaust portion having a dwell extending throughout a sufficient portion of the cam cycle to hold said piston stationary for a substantial length of time between the end of a power stroke and the beginning of a succeeding compression stroke to provide a prolonged scavenging interval.

2,001,534

FLUID PRESSURE REGULATOR

Ralph C. Hughes, Anderson, Ind., assignor to Reynolds Gas Regulator Co., Anderson, Ind., a corporation of Indiana
Application January 29, 1932, Serial No. 589,663
2 Claims. (Cl. 50—27)

1. In pressure regulators the combination with a valve casing of the bridge wall type formed with inlet and outlet ports and having a central opening in its upper wall and a vertical aperture adjacent said outlet port, of a valve mounted on the bridge wall, a diaphragm casing mounted on said valve casing and having a reduced guide aperture in its lower section registering axially with said central opening, and a lateral wall aperture, control means for said valve including a diaphragm in said diaphragm casing above said lateral wall aperture, the said diaphragm being responsive to pressure therebeneath, stem means movable through said guide aperture operatively connecting said diaphragm and valve, a tubular



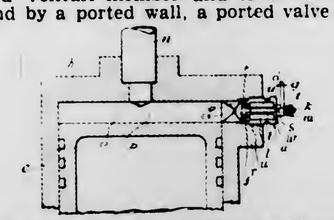
stem mounted in said vertical aperture of the valve casing and extending through the latter aperture and into the casing to a point spaced from the bridge wall and in a plane common with the inner end of said outlet port, and a detachable tubular connection between said tubular stem and said lateral wall aperture.

2,001,535

INTERNAL COMBUSTION ENGINE

Franz Lang, Munich, Germany, assignor to Lanova Aktiengesellschaft, Vaduz, Liechtenstein
Original application December 1, 1930, Serial No. 499,224. Divided and this application November 1, 1933, Serial No. 696,155. In Germany December 27, 1929
3 Claims. (Cl. 123—48)

3. In combination in an injection engine, a cylinder and a head therefor, a piston operating in the cylinder and, when in its position of maximum compression, defining with said head and the adjacent end portion of said cylinder a combustion space, an injection nozzle disposed to inject fuel directly into said space, a cylindrical air storage chamber opening into said combustion space through a Venturi nozzle defining a restricted orifice and two passages leading thereto, said passages leading from and flaring toward said combustion space and said air storage chamber, respectively, a cylindrical valve fitting snugly within said air storage chamber and forming a fluid tight closure with the circumferential wall thereof, and means for adjusting said valve lengthwise of said air storage chamber.



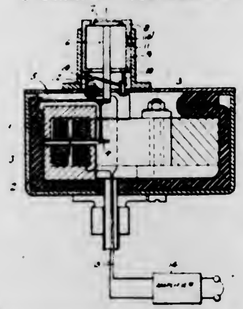
2,001,536

INTERNAL COMBUSTION ENGINE

Franz Lang, Munich, Germany, assignor to Lanova Aktiengesellschaft, Vaduz, Liechtenstein
Original application December 1, 1930, Serial No. 499,224. Divided and this application November 1, 1933, Serial No. 696,156. In Germany March 6, 1929
2 Claims. (Cl. 123—32)

2. In combination in an injection engine, a cylinder and a head therefor, a piston operating

in the cylinder, an injection nozzle disposed to inject fuel into the combustion space of the cylinder, an air storage chamber comprising a Venturi member opening into said combustion space and a casing extending from the outer end of said Venturi member and closed at its inner end by a ported wall, a ported valve at the

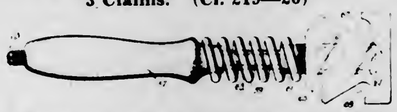


inner side of said wall and defining with said wall and the outer portion of said Venturi member an air storage chamber of fixed capacity, said casing also defining an air storage chamber of fixed capacity, and means for adjusting the valve and thereby controlling communication between said chambers of said air storage chamber.

2,001,537

STETHOSCOPE

Cyril Arthur Mason, Northampton, England, assignor to General Electric Company, a corporation of New York
Application March 3, 1934, Serial No. 713,903
In Great Britain March 6, 1933
5 Claims. (Cl. 181—24)

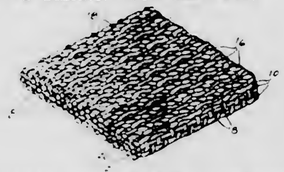


1. In a stethoscopic apparatus, a microphonic device including a movable member, a disc adapted to be pressed into contact with a body thereby to be vibrated by sounds to be transmitted from said body, means to transmit the vibrations of said disc to said movable member, and means to maintain substantially constant the pressure of said disc against said body.

2,001,538

HEATING TOOL

Oscar B. Mueller, Charles A. Hill, and John W. Tielking, Port Huron, Mich., and Gordon R. Jones, Rochester, N. Y., assignors to Mueller Brass Co., Port Huron, Mich., a corporation of Michigan
Application June 2, 1933, Serial No. 674,010
3 Claims. (Cl. 219—26)

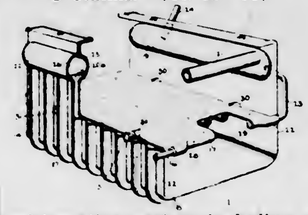


1. A soldering tool comprising an electrical resistance heating unit, and a head fitted to said unit and enclosing the same, said head comprising a block of metal of good heat conductivity, and at least one notch in said head, said notch being bottomed by a semi-cylindrical portion having a circular surface in excess of 180° of arc, whereby said notch is adapted to receive a pipe and closely surround the same over more than half of the circumference thereof.

2,001,539

BRAKE LINING WITH METALLIC LUBRICATION

William Nanfeldt, Clifton, N. J., assignor to World Bestos Corporation, Paterson, N. J., a corporation of Delaware
Application July 9, 1931, Serial No. 549,795
3 Claims. (Cl. 139—425)



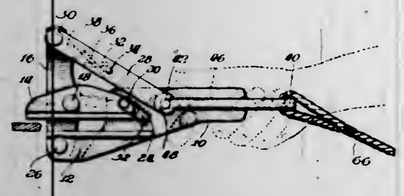
1. In a brake lining a plurality of layers of fabric composed of warp and woof threads, said threads being formed of felted short fibred asbestos yarn containing supporting filaments, and a plurality of binder threads positioned at spaced intervals across the lining and woven longitudinally of said lining over at least one of the woof threads in the uppermost layer down through the lining and under at least one of the woof threads in the lowermost layer and up again through the lining and over an adjacent woof thread of the uppermost lining, said binder threads being formed of long fibred asbestos yarn containing a lead wire.

2,001,540

EVAPORATOR FOR REFRIGERATING SYSTEMS

Delbert F. Newman, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application July 1, 1933, Serial No. 678,628
3 Claims. (Cl. 62—95)

1. A refrigerating system including a flooded evaporator having a header and a depending refrigerant-circulating portion, a cast metal shelf secured to said depending portion and having a refrigerant conduit embedded therein, means for circulating liquid refrigerant through said conduit and for then supplying said liquid refrigerant to said evaporator, and means for withdrawing gaseous refrigerant from said header.

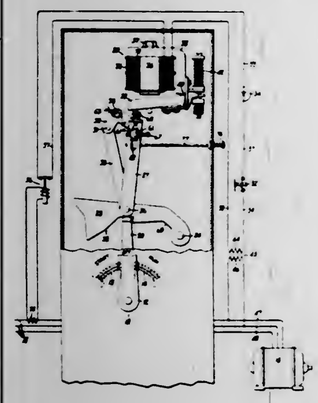


2,001,541

WIRE GRIPPING TOOL

Lorence O'Russa, Princeville, Ill., assignor to Mathias Klein & Sons, Chicago, Ill., a corporation of Illinois
Application June 5, 1933, Serial No. 674,337
7 Claims. (Cl. 24—134)

6. In a gripping tool, the combination of a pair of jaws, means for relatively moving said jaws,

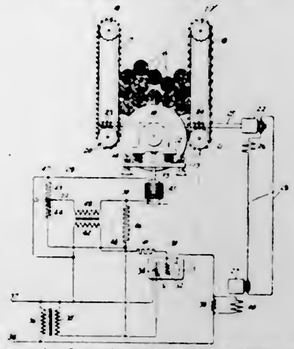


an element to maintain said jaws in substantial parallelism when moved relative to each other by said means, a clevis pivotally connected to said means for applying a force thereto, a spring tensioned to move said jaws to closed position, and an element connected to said clevis and operated by swinging movement thereof to cause said clevis to move laterally and by force applied to said element to separate said jaws.

2,001,542
UNDERVOLTAGE PROTECTIVE SYSTEM

Joseph W. Owens, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application October 19, 1933, Serial No. 694,273
9 Claims. (Cl. 175—294)

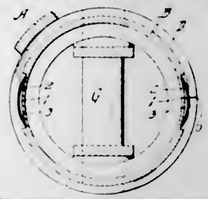


1. In combination, a switch biased to open position, means for holding the switch in the closed position comprising a relatively movable member operable into engagement with the switch in the circuit closing position and arranged to be moved by the switch upon operation thereof from the circuit closing position, locking means for said member for preventing said movement by said switch, an electromagnet provided with an armature and a normally closed magnetic circuit, means for biasing said armature from an attracted position into operative position with said locking means, means including a rectifier for energizing said electromagnet through a normally closed electrical circuit, and means for mechanically moving said armature to said attracted position, whereby said electromagnet maintains said armature in said attracted position a predetermined time interval after a reduction in its energization.

2,001,543
CONTROL SYSTEM

John H. Payne, Ballston Spa, N. Y., assignor to General Electric Company, a corporation of New York

Application January 28, 1930, Serial No. 424,053
11 Claims. (Cl. 83—75)

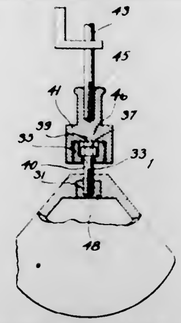


2. In a control system for a machine provided with a work performing member, a drive shaft supporting said member, resilient means mounting said shaft and providing for deflections of said shaft proportionally to the pressure of the load thereon, means for supplying a material to said work performing member, a control circuit including a compressible carbon pile resistance, means mounting said resistance so that a pressure is applied thereto in response to the deflection of said shaft so as to vary the current in said circuit in proportion to the magnitude of said deflections, and means responsive to the current in said circuit for controlling said material supplying means so that the supply of said material is proportional to the variations in said current.

2,001,544
ANTIPISTON SLAP MEANS

Harold P. Phillips, Maplewood, Mo.

Application July 13, 1931, Serial No. 550,374
3 Claims. (Cl. 309—5)

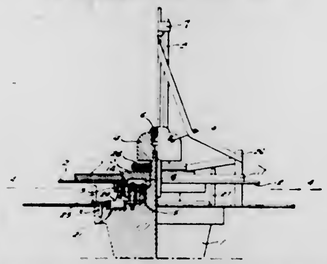


1. In combination with a piston and a one piece split ring fitted in the groove thereof, of a pair of piston centralizers each comprising a short strip of arc shaped resilient material with the ends thereof seated in grooves milled in the base of the ring groove and each pair of centralizers disposed diametrically opposite each other to exert an outward thrust against the fitted ring at diametrically opposite points and at a right angle to the longitudinal axis of the wrist pin carried by the piston.

2,001,545
VALVE

Jacob Podolsky, Dorchester, Mass.

Application June 20, 1929, Serial No. 372,380
25 Claims. (Cl. 4—56)



1. A valve having, in combination, two members, one a valve body and the other a lifting rod, one of the members having an internally threaded socket, a threaded sleeve threaded in the socket and having alined openings of different dimensions, and the other member having an enlarged portion in the larger opening, there being a universal connection between the other member and the sleeve, whereby the valve body is permitted universal play to become snugly seated upon a valve seat.

2,001,546
MACHINE FOR COVERING ELECTRICAL WIRES OR TAPES

Gaston Pourtier, Romainville, France

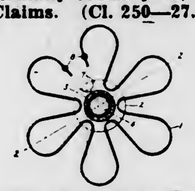
Application September 30, 1931, Serial No. 566,108
In France September 30, 1930
4 Claims. (Cl. 117—45)

1. In a wire-covering machine a rotatable winding head, a device for supporting a coil of covering material mounted to rotate coaxially with said head and driven thereby and also rotatable relatively to said head, a tension controlling device mounted for movement substantially about the axis of said head and having a guide for engagement with the material being wound, a pawl for holding said supporting device from rotation relatively to said head, a throw-out device movable with the guide for disengaging the pawl and a spiral spring surrounding the axis of rotation for controlling said guide.

2,001,547
METHOD OF OPERATING PLUNGER LIFT APPARATUS

Norman H. Ricker, Houston, Tex., assignor to Hughes Tool Company, Houston, Tex., a corporation of Texas

Application February 13, 1932, Serial No. 592,825
2 Claims. (Cl. 103—5)

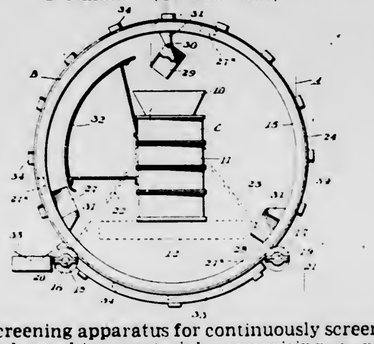


1. A method of raising liquid from wells having an eduction tube therein comprising introducing a barrier below a load of liquid in said tube, reducing the air pressure in said tube above said load, providing for full atmospheric pressure on the liquid outside said tube and below said barrier, and thus raising said barrier with its load by atmospheric pressure.

2,001,548
CATHODE FOR ELECTRIC DISCHARGE DEVICES

Edgar Römhild, Berlin-Steglitz, Germany, assignor to General Electric Company, a corporation of New York

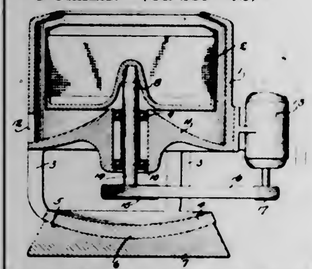
Application January 15, 1932, Serial No. 586,933
In Germany January 22, 1931
6 Claims. (Cl. 250—27.5)



3. A cathode for an electron discharge device comprising a metallic strip having recurrent loops which form in the aggregate; roughly a cylinder, a support member mounted in the axis of the cylinder, and extending over and secured to the edges of said loops.

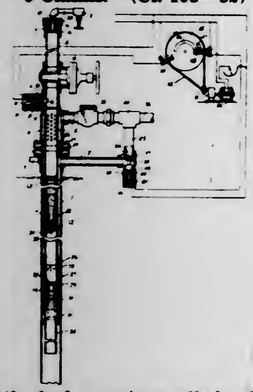
2,001,549
SCREENING APPARATUS

Thomas Sandy, Goderich, Ontario, Canada



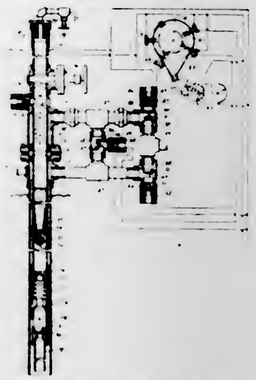
Application January 21, 1933, Serial No. 652,792
In Canada August 18, 1932
4 Claims. (Cl. 209—284)

1. Screening apparatus for continuously screening and crushing materials comprising a rotatably mounted screen, a crushing device cooperatively associated with the screen, a series of carrier buckets pivotally supported within the



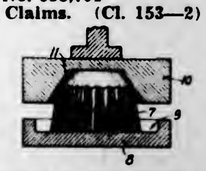
screen, guide means for retaining the carrier buckets and regulating the dumping movement thereof and trough means for collecting the screened materials.

2,001,550
CENTRIFUGAL
Fletcher Schaum, Philadelphia, Pa., assignor to Fletcher Works, Incorporated, Philadelphia, Pa., a corporation of Pennsylvania
Original application July 27, 1929, Serial No. 381,416. Divided and this application June 11, 1932, Serial No. 616,617
8 Claims. (Cl. 210—72)



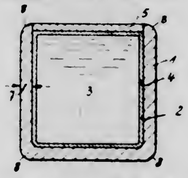
6. In a self-balancing machine of the open top type, the combination of a tub, a basket mounted for rotation within the tub, and a single sliding bearing concentric with the basket and constituting the sole support of the tub.

2,001,551
PLUNGER LIFT APPARATUS
Clarence N. Scott, Houston, Tex.
Application March 15, 1934, Serial No. 715,648
6 Claims. (Cl. 103—52)



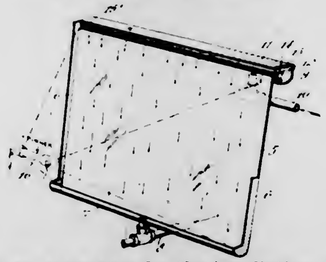
1. A method of pumping wells having a casing and an eduction tube and having gas under pressure therein, including releasing gaseous fluid pressure from the said casing and tubing to relieve the pressure in the well and in the producing formation adjacent thereto and permit the fluid to flow freely into the well and build up to the desired liquid level in said tubing and casing, dropping a freely moving plunger into said tube, interrupting escape of gas from and building up gaseous fluid pressure in the casing to depress the level of the liquid in said casing, introducing said built-up pressure fluid into said tube below said plunger, raising said plunger with its load of liquid to the surface and discharging said load, retaining said plunger at the upper end of said tube, and again releasing fluid pressure from said tubing and casing and repeating the operation.

2,001,552
PLUNGER LIFT CONTROL DEVICE
Clarence N. Scott, Houston, Tex.
Application March 15, 1934, Serial No. 715,649
3 Claims. (Cl. 103—52)



1. In a plunger lift apparatus including a well casing an eduction tube therein having a fluid outlet at its upper end and a plunger movable freely therein, the method of operation including accumulating a load of liquid above said plunger, employing gas pressure below said plunger to engage and to raise said plunger and its load of liquid to the surface and discharging said liquid, closing said outlet to prevent discharge of gas from below said plunger and trapping said gas in said tube, releasing the gas pressure in the casing outside the tube to allow fluid from the producing formation to freely enter the well and casing and build up liquid level in same, closing the casing against further release of gas, and allowing discharge of gas from said tube to said casing, closing off the passage of gas from said tubing to said casing, opening the said outlet from the tube to release gas pressure from same, and allow liquid to transfer from the casing as accumulating gas from the formation builds up pressure and depresses it in said casing and build up said liquid in the tubing to the desired level, dropping said plunger into said tube to a point below the level of liquid in same, and repeating the operation.

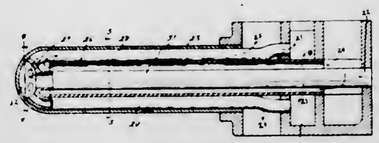
2,001,553
METHOD OF MANUFACTURING RADIALLY CORRUGATED DISKS
John A. Spencer, Newtonville, Mass., assignor, by mesne assignments, to General Plate Company, Attleboro, Mass., a corporation of Massachusetts
Original application June 26, 1930, Serial No. 463,961. Patent No. 1,895,590, dated January 31, 1933. Divided and this application January 26, 1933, Serial No. 653,701
3 Claims. (Cl. 153—2)



2. The method of manufacturing radially corrugated snap-acting disks which comprises preparing an endless blank, corrugating said blank and imparting to the individual corrugations a rounded contour, compressing the corrugations at one edge of the blank, while at the same time expanding the corrugations at the other edge of the blank, thereby imparting an approximately disk shape to the blank, and leaving the central portion of the disk shape slightly displaced from the peripheral portion.

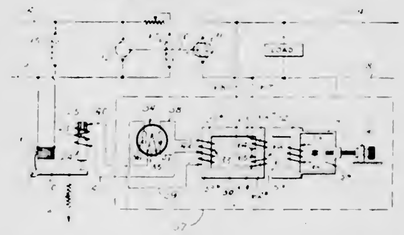
2,001,554
BEVERAGE PRODUCT
Karl Wilhelm Süssmuth, Langenau, near Ulm, Germany
Application July 15, 1933, Serial No. 680,557
In Germany July 22, 1932
1 Claim. (Cl. 99—11)

Preserved beverage comprising a closed shell of fine-grained compressed sugar, a body of a plant extract saturated with sugar enclosed in said shell, and a lining of crystallized sugar separated out from said body on the inner wall of said shell.



2,001,555
DEVICE FOR THE IRRADIATION OF MILK WITH ULTRAVIOLET RAYS
Henning A. Trebler, Baltimore, Md., assignor to Hanovia Chemical and Manufacturing Company, Newark, N. J., a corporation of New Jersey
Application March 15, 1934, Serial No. 715,577
9 Claims. (Cl. 99—2)

1. In an apparatus for the irradiation of flowing liquid films, one or more inclined or vertical surfaces over which said liquid flows, a trough connected to the upper edge of each of said surfaces, a knife edge at the junction between said trough and said surface, one or more baffles in said trough to disperse air or gas bubbles, and to hold back foam and suspended particles in the liquid before said liquid flows over the irradiation surfaces.

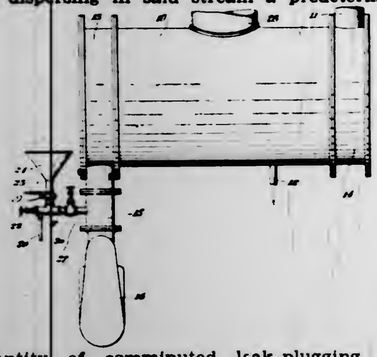


2,001,556
FLUID COOLED SUPERHEATER CONSTRUCTION
Charles S. Turner, Detroit, Mich.
Application May 2, 1931, Serial No. 534,490
7 Claims. (Cl. 122—481)

1. A fluid-cooled superheater tube unit, having, in combination with an outer shell adapted for inlet and outlet connection at the same end with an external steam supply source, the other end of said shell being closed, cooling fluid conducting pipes arranged within said outer shell in position to conductively receive heat units imparted to certain external surface portions thereof from an outside source and adapted in turn to modifyingly transmit the normally lower temperature of their contents to certain of the spaces

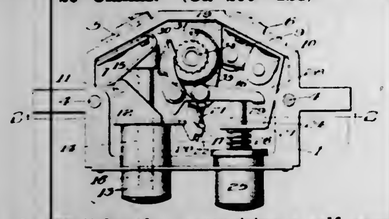
within said outer shell not occupied by such pipes, and an interiorly positioned steam pipe for introducing a supply of steam adjacent the closed end of said outer shell, whence it is adapted to emerge, while subjected to the thermal influences described, through the available lengthwise passages therein.

2,001,557
ELECTRIC REGULATION
Louis H. Von Ohlsen, New Haven, Conn., assignor to The Safety Car Heating & Lighting Company, a corporation of New Jersey
Application April 19, 1933, Serial No. 666,812
21 Claims. (Cl. 171—119)



12. In a system of the character described, in combination, a rotating member whose speed is to be controlled, electro-responsive means for controlling the speed of rotation thereof, means producing a varying E. M. F. whose frequency is a function of the speed of rotation of said member, reactance coupling means, means energizing said electro-responsive means through said reactance means at a certain current value corresponding to the speed at which said rotating member is to rotate, and means for varying the energization of said electro-responsive means with change in frequency comprising a separate and isolated resonant circuit inductively coupled to said reactance means, said resonant circuit having the characteristic of change in impedance with change in frequency of the current energizing said resonant circuit.

2,001,558
METHOD AND MEANS FOR TEMPORARILY PLUGGING CONDENSER LEAKS
Oscar J. Wheeler, Jersey City, N. J.
Application March 1, 1933, Serial No. 659,109
5 Claims. (Cl. 137—99)



1. The combination with a water-tube condenser including an inlet conduit for the cooling water, of means for injecting a stream of fluid

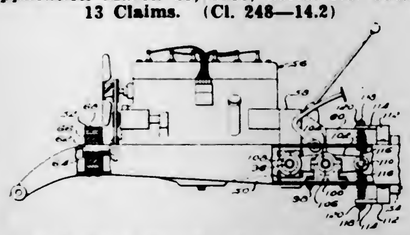
into said inlet conduit at high velocity, and means for dispersing in said stream a predetermined

quantity of comminuted leak-plugging solid material.

2,001,559
CIRCUIT BREAKER
Gustav O. Wilms, Milwaukee, Wis., assignor, by mesne assignments, to Allen-Bradley Company, Milwaukee, Wis., a corporation of Wisconsin
Application December 16, 1929, Serial No. 414,377
20 Claims. (Cl. 200—124)

1. A circuit breaker comprising a self-opening switch, a support, a catch carried by said support to hold said switch closed, thermally operated means arranged upon one side of said support to trip said catch and permit said switch to open, an electric heater arranged upon the other side of said support and connected in circuit with said switch to generate heat to operate said means, and manually operated means to trip said catch independently of said thermally operated means.

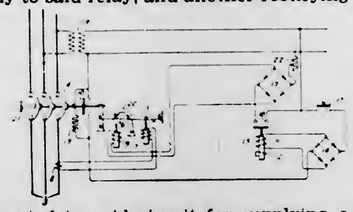
2,001,560
LISTER PLANTER
Herman E. Altgelt, South Bend, Ind., assignor to Oliver Farm Equipment Company, a corporation of Delaware
Application October 19, 1932, Serial No. 638,489
22 Claims. (Cl. 97—72)



1. A planter comprising a front frame, a rear frame pivoted to said front frame, press wheels for supporting said rear frame, adjustable gauge wheels for said front frame, a plurality of ground engaging tools carried by said front frame, and means associated with said frames and operatively connected with said press wheels for raising said front frame relative to said rear frame and for raising said gauge wheels off the ground and said tools out of the ground.

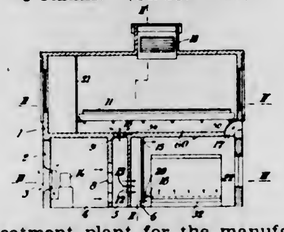
2,001,561
TRANSFER FILE CASE
Henry J. Anglin, Morristown, N. J.
Application August 24, 1932, Serial No. 630,304
4 Claims. (Cl. 229—19)

1. In a filing case, the combination with an outer containing case, of a drawer cradle member comprising side supporting walls and a swing supported from the upper parts of the side walls and a sliding drawer in the cradle.



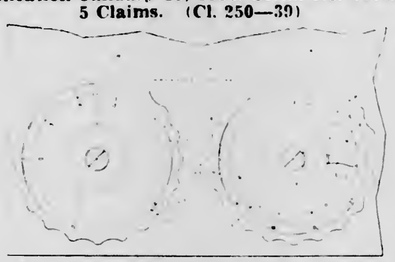
2,001,562
MOTOR MOUNTING
William Harold Bagley, Jr., Detroit, Mich., assignor of thirty per cent to James A. Bent and thirty per cent to Ralph J. Welch, both of Detroit, Mich.
Application March 25, 1933, Serial No. 662,685
13 Claims. (Cl. 248—14.2)

1. In a motor vehicle, the combination with a chassis frame and an engine mounted therein for driving the vehicle, of means for supporting said engine for limited vibratory movement around a line extending in approximately longitudinal relation with respect to the engine, and means for dampening said movement including an arm rigid with the engine and adapted to vibrate therewith, a movable member carried by said frame and connected with said arm to be vibrated thereby in a path transverse to the plane of vibration of said arm, and means interposed between said member and said frame for cushioning the vibrations of said member.



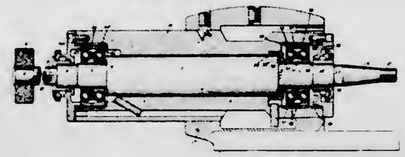
2,001,563
CONTROL OF CIRCUIT BREAKERS
Herman Bany, Lansdowne, Pa., assignor to General Electric Company, a corporation of New York
Application August 15, 1934, Serial No. 739,921
6 Claims. (Cl. 175—294)

1. In combination with an alternating current circuit, a circuit breaker for controlling said circuit and means for controlling the closing of said circuit breaker including a closing mechanism having an energizing winding and a relay having a delayed drop-out when deenergized subsequently to energization by a unidirectional current for controlling the circuit of said winding, rectifying means arranged to be connected to said circuit for supplying a unidirectional current directly to said relay, and another rectifying means



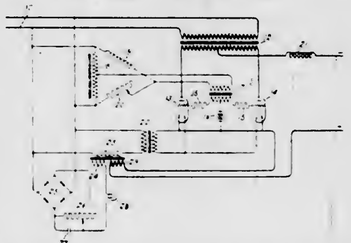
connected to said circuit for supplying a unidirectional current to said closing mechanism winding when said relay picks up.

2,001,564
APPARATUS FOR AERATING BEER WORT
Karl Barth and Karl Schuler, Munch, and Julius Wanger, Aubing, Germany
Application December 14, 1931, Serial No. 580,828
6 Claims. (Cl. 261—119)



1. A treatment plant for the manufacture of beer wort, comprising a room having a cooling floor for containing beer wort, a plurality of compartments beneath said room each in communication with the other, an air pressure fan in one compartment, for forcing air through the other compartment and room, and means intermediate the compartments for filtering air passed through said compartment and room, a valve-controlled conduit between the compartments in communication with the room, and air discharge means in the room controlling the escape of air therefrom, the air in said room being under positive pressure and distributed uniformly over the beer wort as a closed veil on said cooling floor.

2,001,565
INTERPOLATING DEVICE
Anatole P. Berejkoff, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application January 18, 1934, Serial No. 707,230
5 Claims. (Cl. 250—39)



1. The combination of means to produce a beat frequency between oscillations the frequency of which is to be indicated and other oscillations, means including a variable position device to control the frequency of said other oscillations to produce a zero beat in a certain position of said variable position device and a definitely recognizable beat when said variable position device is in positions on either side of said certain position and removed therefrom by equal distances, an index for said variable position device movable over a fixed calibrated scale, a movable calibrated scale cooperating with said fixed scale, having calibrations thereon representing values equal to the calibrations on the fixed scale and spaced apart by distances double the spacing of the calibrations on the fixed scale whereby the frequency of said oscillations may be determined by moving the index to a position on the fixed scale where said readily recognizable beat is produced, moving the corresponding calibration on the movable scale to the same position, then moving the index to the other position where the recognizable beat is produced and determining the frequency from the movable scale.

2,001,566
ANTIFRICTIONALLY MOUNTED SPINDLE
Harold E. Brunner, Larchmont, N. Y., assignor, by mesne assignments, to S K F Industries, Inc., Philadelphia, Pa., a corporation of Delaware
Application May 11, 1933, Serial No. 670,397
11 Claims. (Cl. 308—189)

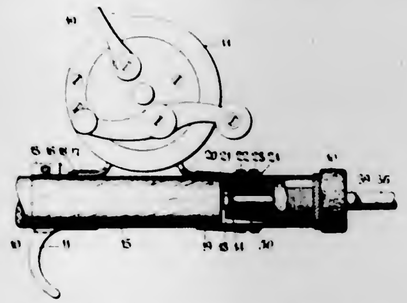
1. The combination with a spindle having at each end a neck formed on its perimeter with a cylindrical bearing seat, of a quill having hollow cylindrical bearing seats formed at its respective ends, and two self-aligning anti-friction bearings having cylindrical bores in their inner rings tightly fitted upon the bearing seats of the spindle necks, the end faces of each of such inner race rings being entirely open, clear and free, the outer race rings of such bearings being mounted in the bearing seats formed in the quill.

2,001,567
ELECTRIC VALVE TRANSLATING CIRCUIT
Byron A. Case, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York
Application December 22, 1933, Serial No. 703,565
3 Claims. (Cl. 175—363)

1. An electric translating system including a source of alternating current and an electric

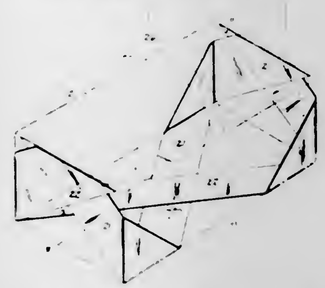
valve provided with a thermionic cathode, a circuit for energizing said cathode from said source including a saturable reactor, means for normally constantly saturating said reactor, and means responsive to an electrical condition of said system for modifying the saturation of said reactor to regulate the heating of said cathode.

2,001,568
LUBRICATING DEVICE
John L. Creveling, Tucson, Ariz., assignor to The Lubrication Corporation, South Bend, Ind., a corporation of Delaware
Application September 17, 1931, Serial No. 563,403
7 Claims. (Cl. 221—47.4)



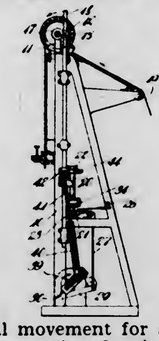
1. In combination, a lubricating gun including a pressure pump having a pump cylinder provided with an inlet passageway, a lubricant cartridge comprising an original lubricant package, said package being open at one end, a follower piston in said cartridge located between the opposite end of the cartridge and its lubricant contents, and a member providing a lubricant tight quick attachable-detachable friction type closure for said open end of said cartridge, said closure being substantially permanently fixed to said lubricant gun, said closure being disposed in a plane substantially perpendicular to the axis of said pump cylinder, said lubricant inlet passageway being located inwardly of the inner side of said lubricant cartridge closure member, said pump being so arranged with respect to said closure as to tend to tighten the closure during the normal pressure stroke of the pump.

2,001,569
BOBBIN
William E. Kiefer, Allentown, Pa.
Application July 8, 1933, Serial No. 679,549
5 Claims. (Cl. 242—118)



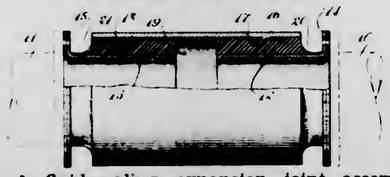
1. A textile bobbin having a head consisting of a laminated disk comprising layers of paper and textile fabric both impregnated with a hardened binder, said paper extending radially beyond the fabric to form the extreme peripheral section of the disk from which the fabric is excluded, said peripheral section providing a smooth bearing surface for yarn withdrawn axially from the bobbin over the edge of the head and preventing contact of said yarn with the fabric.

2,001,570
LINE DRIER
Albert S. Fenton, Buffalo, N. Y.
Application March 30, 1934, Serial No. 718,285
3 Claims. (Cl. 242—104)



3. A line drier for engagement with a rod butt having a socket in one end thereof comprising a rotatable hub, a plurality of arms connected to said hub for engaging a line, supporting means extending through said hub for rotation of the hub thereon at one end and a tapered resilient member carried on the other end of said means for engagement with a rod butt socket.

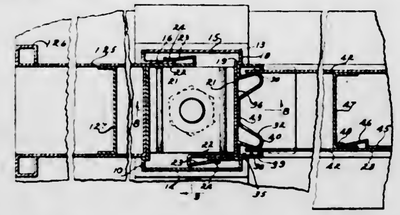
2,001,571
BASKET
William H. Grinfin, Cleveland, Ohio
Application March 31, 1934, Serial No. 718,467
6 Claims. (Cl. 217—122)



1. In a basket, a body comprising a bottom, end walls and side walls, and a pair of bracing members, the bracing members each extending diagonally across the bottom of the basket body, each end portion of each of the bracing members extending around a vertical corner between the bottom and a side wall of the basket body and around a vertical corner between the side wall and an end wall of the basket body, and being secured adjacent the upper margin of the end wall.

2,001,572
FEEDING DEVICE
Urban C. Haren, Akron, and John P. Sapp, Kent, Ohio, assignors to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application December 7, 1933, Serial No. 701,286
1 Claim. (Cl. 74—117)

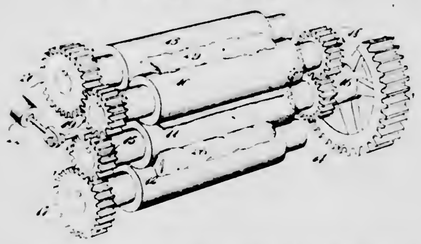
A mechanical movement for actuating a machine element in a series of reciprocal movements of successively different amplitude, comprising a driven crank shaft, a lost motion pitman, means operatively connecting said pitman with said machine element and said crank shaft for advancing the machine element positively in one direction, an abutment fixed to the machine element to limit its return movement, a series of stops arranged to be moved successively into the path of said abutment in paths perpendicular to the direction of movement of said machine element, and means actuated by the crank shaft for advancing the stops in succession.



2,001,573
FLUID SEALING EXPANSION JOINT
Fred L. Haushalter, Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application August 31, 1934, Serial No. 742,249
10 Claims. (Cl. 285—90)

1. A fluid-sealing expansion joint assembly comprising as a structural unit inner and outer sleeve structures arranged telescopically for relative axial movement, respective pipe-attaching elements in association therewith, and a body of rubber filling the radial space between said sleeve structures in fluid-sealing and non-slipping relation thereto and leaving the adjacent ends of the structures axially free and resisting relative axial movement of the sleeve structures by shear stress of the rubber.

2,001,574
METAL PARTITION
Ludwig G. Jacobson, Jamestown, N. Y., assignor to Dahlstrom Metallic Door Company, Jamestown, N. Y., a corporation of New York
Application November 8, 1929, Serial No. 405,643
16 Claims. (Cl. 189—34)

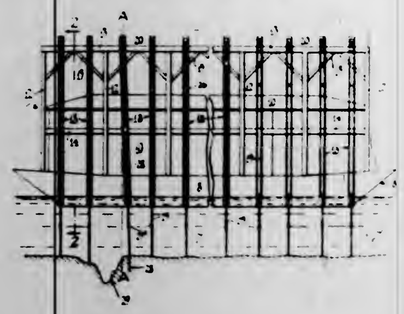


6. In partition construction, a pilaster comprising two elements, means removably engaging said elements, and an adjusting device engageable with said elements and adapted to move said elements laterally relative to each other while said partition is assembled.

10. In partition construction, a subcornice, a channel clip joined to one face of said cornice, a panel frame, walls defining a longitudinally extending recess in the outer face of said frame for receiving said clip and vertically aligning said cornice and said frame.

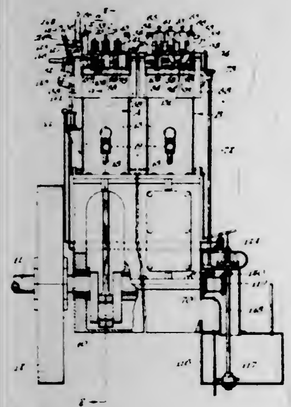
13. In partition construction, pilasters, panel frames supported by said pilasters, panels in said frames, and clips on the inner edges of said frames for frictionally and adjustably supporting said panels relative to said frames.

2,001,575
METHOD OF COATING CORD MATERIAL
James V. James, Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application March 23, 1934, Serial No. 717,006
3 Claims. (Cl. 154—2)



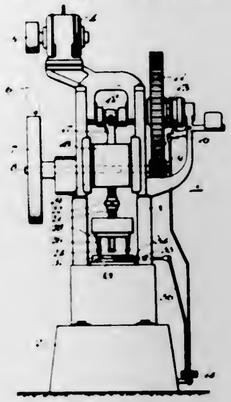
1. The method of coating and filling the interstices of a sheet comprising textile cords which comprises applying a layer of plastic material to one face of the sheet while the sheet is supported by a roll to hold the cords in the desired relation, and without removing the sheet from its support, wiping plastic into its interstices from the opposite face of the sheet and simultaneously forming a coating over the face of the sheet.

2,001,576
UNDERWATER DRILLING APPARATUS
Algot F. Johnson, Minneapolis, Minn.
Application February 6, 1935, Serial No. 5,243
5 Claims. (Cl. 255—51)



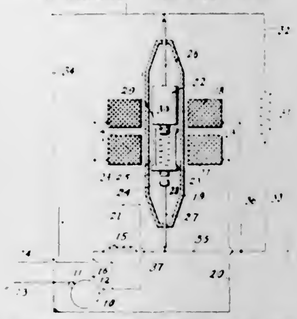
1. In an underwater drilling apparatus, the combination with a barge, of a guide-way vertically disposed in laterally offset relation to an edge of the barge, means for anchoring the guideway to the barge for limited pivotal adjusting movements in the plane of the said edge of the barge, a sand pipe mounted for vertical sliding movements on the guide-way, and a drill operating mechanism mounted for vertical sliding movements on said guide-way above the sand pipe and having a drill rod extending therefrom and

normally through the sand pipe but being removable from the sand pipe by sliding the drill mech-



anism on the guide-way in respect to the sand pipe.

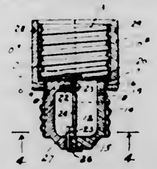
2,001,577
RECIPROCATING ENGINE
John H. Johnson, Buffalo, Minn.
Application July 23, 1932, Serial No. 624,232
7 Claims. (Cl. 60—16)



1. The combination with power driven mechanism and steam utilizing means, of a convertible engine driving said power driven mechanism and supplying exhaust steam to said steam utilizing means, said engine including means for operating it under internal combustion power, means for operating it under steam power and change over mechanism for converting said engine from operation under one source of power to operation under the other, pressure regulator control mechanism responsive to the requirements of said steam utilizing means and controlling the supply of steam to said engine and speed governing mechanism maintaining the speed of the engine substantially constant to meet fluctuating requirements of said power driven mechanism, said speed governing mechanism controlling the supply of combustible fluid to said engine and including means restraining said pressure regulator control mechanism from supplying more steam to said engine than necessary to maintain the speed of the engine proper for meeting the fluctuating requirements of said power driven mechanism.

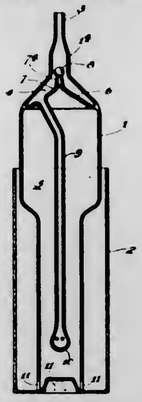
2,001,578
APPARATUS FOR MANUFACTURING TIE PLATES
John F. W. Kruse and Charles W. Dawson, Oakmont, and Andrew T. Richardson, Verona, Pa., assignors to Woodings-Verona Tool Works, Verona, Pa., a corporation of Pennsylvania
Application October 3, 1933, Serial No. 691,968
11 Claims. (Cl. 29—34)

10. Apparatus for forming tie plates from blanks having two spaced ribs on one side thereof comprising a die shoe for supporting a blank and having dies therein, a punch holder carrying punches for cooperating with said dies for making holes in said blanks, a block above said die shoe having recessed portions for receiving a blank therein and having apertures for permitting said punches to pass to said dies, two shears carried by said block for cutting each of said ribs longitudinally for a portion of its length, each of said shears comprising cooperating movable and stationary members on opposite sides of a rib, cams carried by said punch holder for actuating the movable shear members simultaneously in opposite directions to shear said ribs, and means for actuating said punch holder.



2,001,579
GENERATOR REGULATING DEVICE
Bennett M. Leece, Cleveland, and Dale S. Cole, Cleveland Heights, Ohio, assignors to The Leece-Neville Company, Cleveland, Ohio, a corporation of Ohio
Application November 28, 1931, Serial No. 577,836
3 Claims. (Cl. 200—90)

1. In a vibratory electromagnetic device of the character described the combination of an air-

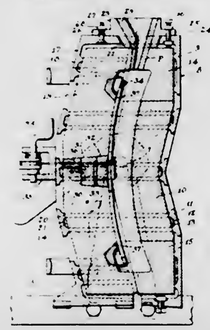


tight envelope, a magnet coil disposed around said envelope, a contact in said envelope, a core for said coil stationarily supported in said envelope, and a vibratory member in said envelope responsive to changes in the magnetization of said core and normally biased toward engagement with said contact for vibratory cooperation with the latter.

2,001,580
ELECTRIC FLASHER
Louis Ludwig, Brooklyn, N. Y.
Application May 24, 1933, Serial No. 672,551
4 Claims. (Cl. 200—115.5)

1. As an article of manufacture; an electric flasher consisting of an insulating body member containing an upper compartment, having openings in the bottom leading to the exterior, and a smaller lower compartment, having a supporting boss and also a slot leading to the lower outer end of the body member; a threaded metal shell, having downwardly extending lugs, secured in the upper compartment with the lugs projecting through the openings leading to the exterior of the body member; an upper center contact and a thermostatic element secured to the boss in the lower compartment; a lower center contact secured in the slot in bottom of the body member; and a threaded metal shell secured on the lower end of the body member and contacting with the lugs of the metal shell contained in the upper compartment.

2,001,581
GAS ABSORPTION PIPETTE
Maryan P. Matuszak, Pittsburgh, Pa., assignor to Fisher Scientific Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 23, 1933, Serial No. 694,763
9 Claims. (Cl. 23—292)



1. In a gas absorption pipette comprising a pair of containers connected at their lower ends, the combination with one of said containers of a gas inlet tube connected to the upper end of the container, a partition wall provided with a pair of openings lying within the container adjacent its upper end and dividing the container internally into an upper valve chamber and a lower absorption chamber, a short tube projecting upwardly into the valve chamber from one of said openings with its upper extended end concentric to said valve chamber and forming a valve seat, a gas conducting, or bubbling, tube extending downwardly from the other of said openings into the lower part of said absorption chamber, and a valve member disposed in said valve chamber for cooperation with said valve seat.

2,001,582
BELT TREATMENT
Ledru R. Parker, San Antonio, Tex.
No Drawing. Application June 1, 1932, Serial No. 614,851
1 Claim. (Cl. 134—17)

A substance for application to used leather and leather and rubber composition belts for the purpose of preventing wear of the belt and slippage of the belts on the pulleys, removing foreign substances collected on the belts before treatment, and keeping the pulleys clean, said substance consisting solely of rubber in fluid condition and only sufficient neat's-foot oil to maintain the rubber in fluid condition while on the belts and counteract the presence of oil and other belt deteriorating matter which may contact the belts while in use, the rubber and neat's-foot oil being present in the approximate proportions of 13 parts of rubber to 1 part of neat's-foot oil.

2,001,583
CASTING MOLD
Fred M. Poe, Suffern, N. Y., assignor to The American Brake Shoe and Foundry Company, New York, N. Y., a corporation of Delaware
Original application March 7, 1931, Serial No. 520,782. Divided and this application August 16, 1933, Serial No. 685,333
1 Claim. (Cl. 22—125)

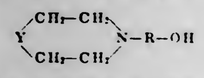
A repetition mold for casting brake shoes and the like and having an elongated mold cavity, a tapered pouring gate extending through one end of the mold in the direction of the length of the mold cavity and communicating with the adjacent end of the mold cavity, a tapered frangible core in said pouring gate, a wall of the mold cavity being made of refractory material and having recesses therein to form projections on the casting adjacent the ends thereof, and frangible cores in said recesses at the opposed ends thereof, the core in the pouring gate adapted to be crushed by the movement of the sprue as the sprue shrinks and the cores in the recesses

adapted to be crushed by the movement of the projections therein as the casting shrinks towards its middle, and thereby permitting the casting to shrink in its normal way from its ends towards its middle without damage to the refractory part of the cavity wall.

2,001,584

SUBSTITUTED MORPHOLINES AND METHOD OF MAKING THE SAME

Marion C. Reed, Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York



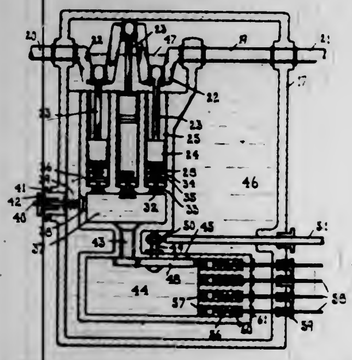
No Drawing. Application April 5, 1930, Serial No. 442,043
19 Claims. (Cl. 260—27)

1. The method of making a compound containing a hydroxy-aryl group substituted on the nitrogen atom of a heterocyclic nucleus, which comprises heating an aminophenol with a compound of the general formula

$$X—CH_2—CH_2—Y—CH_2—CH_2—X$$

wherein X is a halogen atom and Y is CH_2, O, S or N-aryl, and neutralizing the halogen acid formed, during the course of the reaction.

8. A compound having the general formula



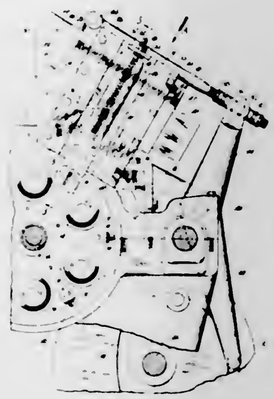
wherein R is an aromatic nucleus and Y is CH_2, O, S or N-aryl.

2,001,585

HYDRAULIC BRAKE

Clyde A. Roeder, Omaha, Nebr.

Application August 12, 1933, Serial No. 684,874
1 Claim. (Cl. 188—99)



A hydraulic brake for motor vehicles and the like comprising a fluid containing housing positioned between the motor and the propeller shaft of the vehicle, a crank shaft journalled in said housing and drivingly connected between said motor and propeller shaft, a cylinder carried by the housing, a piston mounted in the cylinder and adapted to be reciprocated by the crank shaft, a chamber carried by the housing and communicating with an end of the cylinder, a reservoir carried by the housing and in communication with said chamber and the other end of said cylinder, said piston provided with a valve adapted to close during the pressure stroke, a valve located between the cylinder and the said chamber adapted to open during the said pressure stroke, a manually operable valve between the chamber and reservoir for increasing pressure in the chamber and cylinder to brake the propeller shaft of the vehicle, and a safety valve situated between the chamber and the reservoir to relieve excessive pressure.

2,001,586

HEAD SLIDE FOR AUTOMATIC MACHINE TOOLS

Harry W. Rupple, Shaker Heights, Ohio, assignor to The Cleveland Automatic Machine Company, Cleveland, Ohio, a corporation of Ohio

Application April 5, 1932, Serial No. 603,406
2 Claims. (Cl. 29—57)

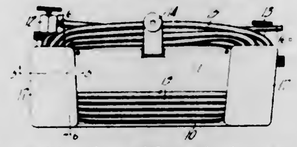
1. In a machine of the character described, the combination of a frame, a spindle rotatably supported by said frame, a tool slide slidably supported by said frame adjacent said spindle, a linearly reciprocable member slidably supported by said frame, an arcuate cam groove in said member, a cam roller carried by said slide in engagement in said cam groove, a shaft rotatably supported by said frame, a lever fixed to said shaft and operatively connected to said member, a walking beam supported by said frame, a lever on said shaft adjustably connected to one end of said walking beam, cam means operatively connected to the other end of said walking beam for controlling the movement of said slide, and resilient means for continuously urging said tool slide in one direction.

2,001,587

MANUFACTURE OF MERCAPTO ARYL THIAZOLES

Waldo L. Semon, Silver Lake Village, and Tirey Foster Ford, Akron, Ohio, assignors to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

No Drawing. Application October 3, 1933, Serial No. 692,028
4 Claims. (Cl. 260—44)



1. The process for preparing a mercapto arylene thiazole which comprises heating a mixture of a mononuclear arylamine and carbon disulphide with an organic oxidizing agent to a temperature in the neighborhood of 220° C.

2,001,588

PORTABLE TESTING INSTRUMENT

Philip T. Sprague, Long Beach, Ind.

Application March 7, 1932, Serial No. 597,286
5 Claims. (Cl. 242—96)

1. The combination with an instrument having a long flexible tube connected therewith, of a pair of spaced brackets each comprising a plate and a boss having a curved edge and a thickness less than the outer diameter of said tube projecting from one face of said plate, said bosses being secured to said instrument in spaced relation and adjacent the opposite ends thereof, said tube being wound around the curved faces of said bosses and being constrictively positioned between said plates and the instrument.

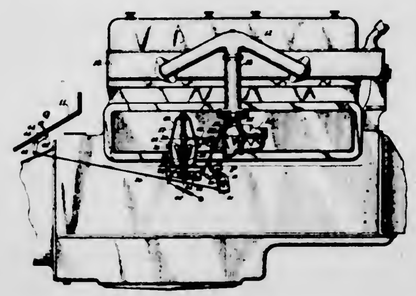
2,001,589

ARTIFICIAL EYEBROW

Anna Steiner, New York, N. Y.

Application January 31, 1934, Serial No. 709,206
1 Claim. (Cl. 132—1)

An artificial eyebrow comprising an elongated flattened suporting member curved to conform substantially to the shape of a human eyebrow, a plurality of hairs secured to one face of said member and confined within the area of the face to cover the same, and means on the other face of the member for attaching same at the eyebrow position on the human face.



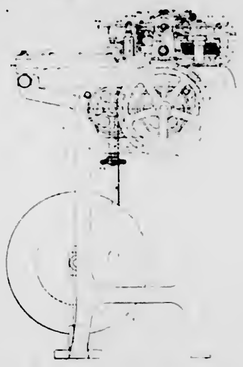
2,001,590

MECHANISM FOR CHANGING AND GOVERNING THE SPEED OF ENGINES

William R. Spiller, Cleveland, Ohio, assignor to The White Motor Company, Cleveland, Ohio, a corporation of Ohio

Application July 20, 1934, Serial No. 736,224
3 Claims. (Cl. 123—108)

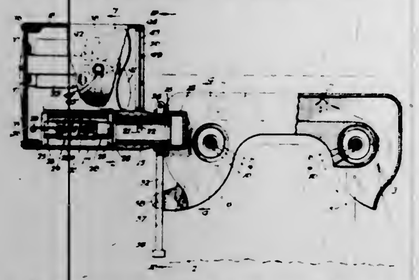
1. The combination in an internal combustion engine, of a throttle valve for said engine, a governor associated with said engine designed to transmit movement at a predetermined engine speed, a throttle actuating lever, a movable member operatively connected to said throttle valve, a second movable member operatively connected determined speed, a third movable member operatively connected to said throttle actuating lever arranged to move in the same direction as said first member in opening and closing the throttle valve, means carried by said first and third members designed for abutting engagement arranged in such a manner that movement of to said governor arranged to be moved thereby upon an increase of speed above the aforesaid predetermined speed in an opposite direction to said first member in causing an increase in speed, and being further arranged in such a manner that it is maintained out of engagement with said first named member at speeds below the aforesaid predetermined speed and brought into engagement with said first member as the engine speed is increased above the aforesaid presaid throttle actuating lever in a direction to open the throttle valve tends to cause separation of said means, and resilient means connecting said first and third members urging engagement of the engaging means carried by such members, said resilient means being designed and tensioned to maintain the aforesaid engaging means in en-



gagement in the absence of interference by said second member, but permitting separation of said engaging means following the point in movement of said first and third members in opening the throttle valve at which further movement of said first member is opposed by the actuating force of the governor acting through said second member.

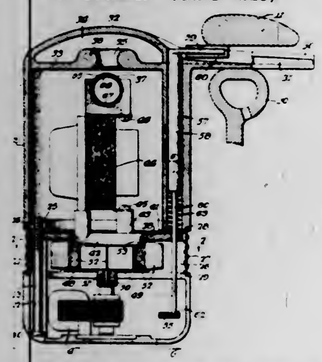
2,001,591

METHOD AND MACHINE FOR MAKING FASTENERS



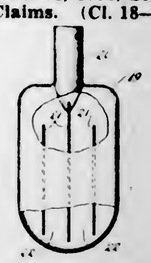
Gideon Sundback, Meadville, Pa., assignor to Hookless Fastener Company, Meadville, Pa., a corporation of Pennsylvania

Application July 13, 1929, Serial No. 378,104. Renewed March 14, 1934. In Canada February 12, 1929
44 Claims. (Cl. 113—1)



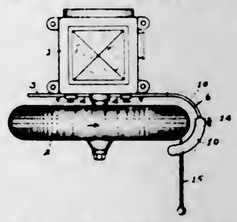
1. In a machine for making fastener stringers of the class described, the combination with a rotatable column having a plurality of dies, of means for revolving said column, means for feeding blanks to said dies, and means to form a blank in one of said dies, means to hold a blank in another of said dies while performing another operation on the member, and common operating means for said blank forming and blank holding means.

2,001,592
VENTILATOR ATTACHMENT FOR TOILET SEATS
Macy O. Teetor, Newcastle, Ind.
Application July 27, 1933, Serial No. 682,362
9 Claims. (Cl. 4—213)



1. In a structure of the class described, a toilet bowl and a seat therefor, a nozzle secured to said bowl, said nozzle having a journal extending therefrom, a housing having a sleeve formed therewith by which said housing is rockably supported on said journal, a chamber formed as a continuation of said sleeve and adapted to support an ozonizer therein, a suction device mounted within the housing and in communication with said nozzle and ozonizer, and means secured to said sleeve and operated by said seat for rocking said housing about said journal for operating said suction device and ozonizer for withdrawing the foul air through said nozzle and ozonizer and passing it to the atmosphere in an ozonized condition.

2,001,593
AIR PURIFYING VENTILATOR FOR TOILET BOWLS
Macy O. Teetor, Newcastle, Ind.
Application May 28, 1934, Serial No. 727,967
17 Claims. (Cl. 4—213)

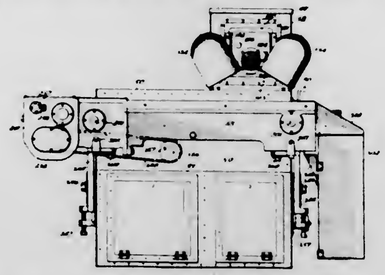


1. In a ventilator unit for attachment to a toilet bowl, a housing having a supporting arm therefor, said housing having an intake portion integral therewith and positioned adjacent the top of and in communication with the interior of said bowl, said housing extending downwardly from its intake portion and having an exhaust opening extending around the circumference thereof intermediate its ends for permitting communication with the outside atmosphere, and means within said housing for withdrawing air from said bowl and feeding it through said exhaust opening in a purified state.

2,001,594
PARTITIONED HOLLOW RUBBER ARTICLE AND METHOD OF MAKING THE SAME
Forest G. Tritt, Barberton, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application March 14, 1934, Serial No. 715,483
13 Claims. (Cl. 18—58)

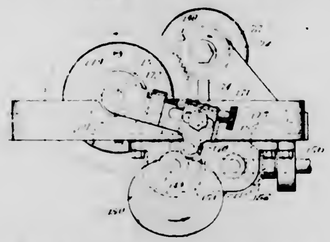
4. The method of making a partitioned hollow rubber article which comprises preparing a form having the shape of the article to be made and having a slot extending from a margin of the form inward along a line corresponding to the position at which a partition is desired in the article, filling a portion of the slot with a disintegrable plug of material which will maintain its integrity for a considerable time while in contact with a liquid dispersion of rubber, introducing a liquid dispersion of rubber into the unfilled portion of the slot and over the surface of the form, solidifying the dispersion to provide a continuous rubber deposit within the slot and upon the form, disintegrating the plug, and removing the form from the article.

2,001,595
TIRE TREAD REMOVER
Oscar H. Babcock, Jr., Pittsburgh, Pa.
Application March 13, 1934, Serial No. 715,383
5 Claims. (Cl. 164—38)



1. A device of the character described comprising, a supporting element, a socket member carried by the latter, a quadrant-shaped tool rest provided with a slot for the reception of the cutting tool, and a pair of connecting pins fixed to and depending from the respective ends of said tool rest for connecting the latter in position to said socket member.

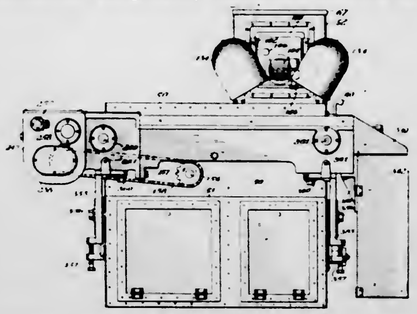
2,001,596
CAMERA
Arthur W. Caps and Paul Landrock, Rochester, N. Y., assignors to Photostat Corporation, Providence, R. I., a corporation of Rhode Island
Application December 21, 1931, Serial No. 582,361
10 Claims. (Cl. 88—24)



1. Photographic apparatus comprising a camera having a shutter, a movable conveyor including an elongated flexible belt-like element

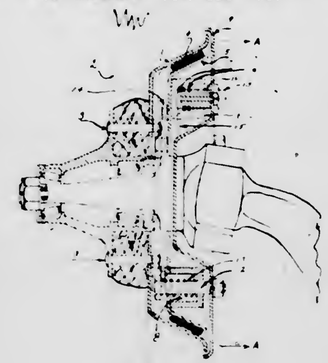
movable repeatedly through an endless path of travel, one portion of which path provides a substantially horizontal flat receiving bed on which pieces of sheet material to be copied may be successively laid, means for moving said conveyor intermittently across the photographic field of

said camera, guide means on said conveyor element for defining successive areas which will be properly placed in said photographic field when said conveyor stops between its intermittent movements, and mechanism for operating said shutter in timed relation to the intermittent movements of said conveyor.



2,001,597
CAMERA
Arthur W. Caps and Paul Landrock, Rochester, N. Y., assignors to Photostat Corporation, Providence, R. I., a corporation of Rhode Island
Original application December 21, 1931, Serial No. 582,361. Divided and this application November 22, 1932, Serial No. 643,872
5 Claims. (Cl. 88—18.2)

1. Photographic apparatus comprising a camera, roller means for feeding sensitized material in said camera, an arm mounted for oscillation and operatively connected to said roller means, cam means for oscillating said arm to operate said roller means, and means for varying the effective length of said arm to vary the amount of sensitized material fed by said roller means at each oscillation caused by said cam means.



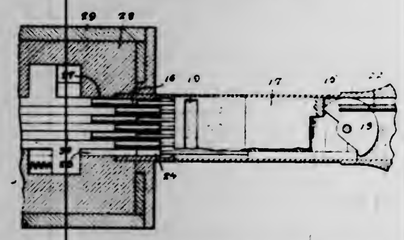
2,001,598
PHOTOGRAPHIC COPY CONVEYER
Arthur W. Caps and Paul Landrock, Rochester, N. Y., assignors to Photostat Corporation, Providence, R. I., a corporation of Rhode Island
Original application December 21, 1931, Serial No. 582,361. Divided and this application December 15, 1932, Serial No. 647,430
8 Claims. (Cl. 88—24)

1. Photographic apparatus comprising a copy conveyer for moving articles with relation to the photographic field of a camera, movable operating means, mechanism for driving said conveyer from said operating means, a plurality of different holding means for rendering said driving mechanism temporarily ineffective to drive said

conveyer notwithstanding continued movement of said operating means, and means for automatically rendering each of said different holding means ineffective after a different extent of movement of said operating means.

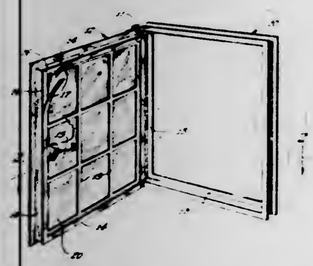
2,001,599
BRAKING APPARATUS
Abraham Cohen, New Haven, Conn.
Application November 23, 1932, Serial No. 644,108
20 Claims. (Cl. 188—71)

8. In a brake, a pressed steel brake drum, a pressed steel base, a pressed steel shoe, a cast iron member fastened to said shoe, means associated with said member responsive to a motive force for causing said shoe to engage said drum.



2,001,600
MULTIPLE UNIT GANG CONDENSER
Samuel Cohen, Brooklyn, N. Y., assignor to General Instrument Corporation, New York, N. Y., a corporation of New York
Application November 21, 1929, Serial No. 408,773
5 Claims. (Cl. 175—41.5)

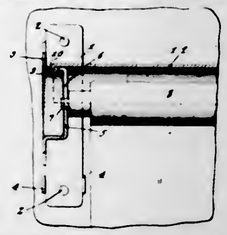
1. A device for engaging the rotor shaft of a multiple variable condenser comprising an elec-



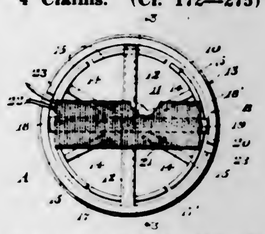
trically conducting yoke member having a forked portion deeper than the diameter of the rotor shaft and comprising a pair of flat metallic arms having their parallel surfaces frictionally engaging said shaft, and a metallic web extending between said metallic arms for supporting said yoke member from the condenser frame.

2,001,601
LOCK KEY
Leo E. Deutsch, Hammond, Ind.
Application June 25, 1934, Serial No. 732,345
6 Claims. (Cl. 70—9)

1. A lock key comprising a body having a bit portion provided with end openings, a plurality of permutation tumblers arranged within the bit portion and adapted for projection through the end openings, means automatically operated on the insertion of the key in a lock to selectively project certain of the tumblers for operation of the lock, and means for effecting the changing of the permutation action of the tumblers.



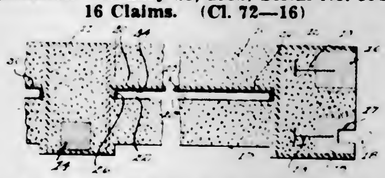
2,001,602
MEANS AND METHOD FOR WEATHER STRIPPING
Frank S. Dietz, Jamestown, N. Y.
Application August 12, 1931, Serial No. 556,682
1 Claim. (Cl. 189—65)



In a window sash and its associated frame each having a bedding contact, a resilient seal between the bedding contacts, said seal being pressed between the bedding contacts in a plastic condition, to mold the seal to the exact formation of the clearance between the bedding contacts.

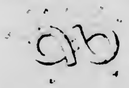
2,001,603
WINDOW SHADE FIXTURE
William H. Dellinger, Franklin, Ohio
Application August 6, 1934, Serial No. 738,705
2 Claims. (Cl. 156—24)

1. A shade fixture comprising an attaching plate, an extension integral with said plate and offset to form a cup-shaped portion slotted to receive a pintle of a shade, and means for supporting a shield to the cup-shaped portion over the shade.



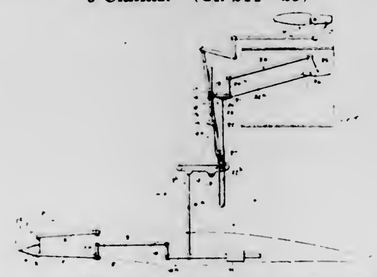
2,001,604
SELF-STARTING SYNCHRONOUS MOTOR
Clark Finch, West Palm Beach, Fla.
Application June 27, 1933, Serial No. 677,942
4 Claims. (Cl. 172—275)

1. In a motor of the class described, a rotor, a ring surrounding said rotor, means for supporting said rotor within said ring, offset oppositely extending curved arms of magnetic material conforming to the contour of said rotor and ring, one end of each arm being supported upon said ring, the opposite end of each arm being slightly spaced from the adjoining arms, both arms constituting a substantially circular casing, and a coil interposed between the arms.



2,001,605
BUILDING CONSTRUCTION
Thomas J. Foster, Ridgewood, N. J.
Application February 23, 1932, Serial No. 594,723
16 Claims. (Cl. 72—16)

1. A preformed heat and sound proof reinforced slab construction comprising a body of light weight heat and sound proof set plastic material reinforced with metal mesh, and having insulating air spaces formed adjacent to and defined by portions of said metal mesh reinforcement.



2,001,606
EMERGENCY LINK
Hyman Gerstein, Hartford, Conn.
Application May 17, 1934, Serial No. 726,127
2 Claims. (Cl. 59—85)

1. An emergency link for tire chains or the like comprising a length of wire bent into substantially S-shape having a relatively straight central body portion, and loops at the opposite ends of said body portion, the free end portions of said loops extending in opposite directions across their respective ends of said body portion and on the same side thereof in normal spaced relation therewith, whereby said end portions may be

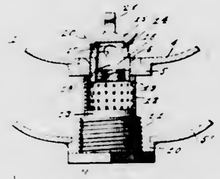
readily connected to adjacent chain ends and bent into substantial contact with the ends of said body portion, in which latter position the extremities of said loop end portions are upturned in opposite directions and so disposed as to be brought into cooperative abutting relationship, across the relatively straight central body portion, under abnormal strains applied to said loops.

2,001,607
AUTOMATIC STABILIZER FOR VEHICLES
Marcel Louis Gianoli, Neuilly-sur-Seine, France
Application December 26, 1933, Serial No. 704,009
In Germany December 31, 1932
9 Claims. (Cl. 244—29)

1. In an automatic stabilizing apparatus, a detecting device for indicating the variations of one at least of the characteristics of the movement of the vehicle, a control, connecting means between the detector and the control for causing the detector to set the control in the direction counteracting the detected variation, means for automatically restoring the control in proximity to its position of rest as soon as the detected variation tends to diminish.

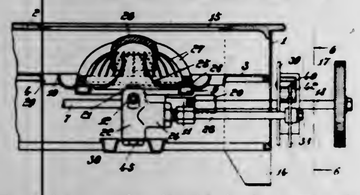
2,001,608
PORTLAND CEMENT PRODUCT
Chester G. Gilbert, Washington, D. C., assignor to Research Corporation, New York, N. Y., a corporation of New York
No Drawing. Application November 1, 1932, Serial No. 640,705
3 Claims. (Cl. 106—25)

2. An improved Portland cement product characterized in that the individual particles thereof are spherical.



2,001,609
BOTTLE STOPPER
Edgeworth Greene, Montclair, N. J.
Application February 11, 1932, Serial No. 592,209
15 Claims. (Cl. 215—21)

1. An independently assembled stopper unit for attachment to a bottle to render the same nonrefillable, comprising a casing adapted to extend within the neck of said bottle to form a valve compartment and having a valve seat with an opening therethrough at the bottom of said casing, a valve device in said compartment, spacing-means arranged circumferentially about said valve device effective between same and the inner walls of said valve compartment to provide longitudinal passageways for the egress of liquid, an orificed cover for said casing adapted to be secured thereto independently of said bottle, a part of said casing being arranged to extend transversely outwardly from the top thereof with



the top surface of same contiguous the bottom surface of said cover and with an included diameter greater than the bore in the neck of said bottle but substantially less than that of the cover to provide means for supporting the casing on the top of the bottle, and a gasket of greater diameter than said extending part of the casing adapted when the stopper unit is secured to the bottle with the gasket under compression, to engage the bottom surface of both the cover and said extending part of the casing.

2,001,610
GAS TANK
John J. Hildenbrand, New York, N. Y.
Application November 13, 1933, Serial No. 697,840
1 Claim. (Cl. 210—170)

A sediment trap including spaced trap walls having aligned inlet and cleanout openings, internally threaded bushings mounted in said openings, a valve seat formed on the bushing of the inlet opening, a cleanout plug threaded to the bushing of the cleanout opening and having a reduced portion defining a seat, a perforated sleeve engaging said seat at one end with the reduced portion of the plug projecting therein and having its opposite end abutting the bushing of the inlet opening, an external and internal threaded valve sleeve threaded in the bushing of the inlet opening and having one end closed and tapered to form a valve element for cooperation with the valve seat, said valve sleeve having openings adjacent the closed end thereof and provided with slots opening outwardly through the open end thereof, and an apertured expanding plug threaded into the open end of the valve sleeve.

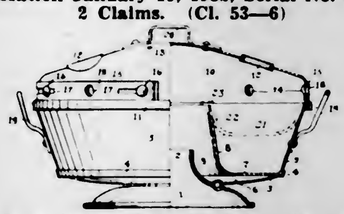
2,001,611
BURNER FOR LIQUID FUEL
Victor Ipsen, Vienna, Austria, assignor to Technik & Investment A.-G., Vaduz, Liechtenstein
Application January 31, 1933, Serial No. 654,515
In Austria May 12, 1930
5 Claims. (Cl. 158—69)

1. In a burner for liquid fuel, a vaporizer, a fuel valve for regulating the admission of fuel to the vaporizer, means for operating the fuel-regulating valve, a gas nozzle for ejecting the fuel which has been vaporized in the vaporizer, a conduit for conducting fuel vapor from the vaporizer to the nozzle, a valve for regulating the free sectional area of the nozzle, and mechanism operatively connected to said fuel-valve operating means for operating said nozzle-regulating valve and for limiting the movement of said means when the fuel valve is moved in a direction away from its seat.

2,001,612
PIPE FOR SMOKING
Marcel Charles Henri Jacquemin, New Barking, England
Application June 24, 1933, Serial No. 677,502
In Great Britain September 17, 1932
2 Claims. (Cl. 131—12)

1. A tobacco pipe comprising a hollow stem having a cylindrical collecting chamber therein, a mouthpiece removably arranged in the stem, a tubular extension of the mouthpiece disposed in said chamber and a resilient swab arranged substantially on the end of the tubular extension and peripherally contacting with the wall of the collecting chamber to form a fluid-tight joint with the said wall, said tubular extension having its peripheral surface spaced from said wall between said swab and the junction of said extension with the mouthpiece proper, and having at substantially the centre of its length an annular enlargement, into the upper and lower parts of which open passages extending to the bore of the mouthpiece and the end of the extension next to the bowl respectively.

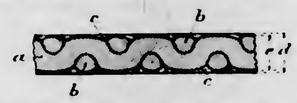
2,001,613
METHOD OF EXTRACTING THE PHENOLS OF TARS AND SIMILAR MIXTURES
Robert Marie Jarry, Paris, France
No Drawing. Application April 27, 1931, Serial No. 533,331. In France May 9, 1930
6 Claims. (Cl. 260—154)



1. A method of extracting the complex phenols of low temperature tars and similar mixtures, which consists in adding to the treated product liquefied ammonia gas of a quantity required for dissolving the complex phenols, effecting an intimate mixture, and then allowing two distinct phases to form, one of which is formed by the liquefied ammonia gas dissolving the complex phenols, to a physical state so that they can be separated mechanically, then finally separating these two phases mechanically and then extracting the complex phenols from the phase containing them.

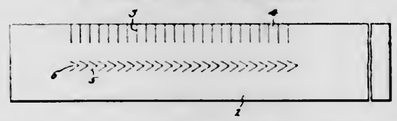
2,001,614
PACKING FOR PIPE JOINTS
Percy Graham Johnson, Letchworth, England, assignor to Victaulic Company Limited, London, England
Application January 6, 1933, Serial No. 650,571
In Great Britain January 22, 1932
3 Claims. (Cl. 288—1)

3. A packing ring for a pipe coupling of the kind having a sleeve extending over the surface of the joined pipe sections at their meeting ends and having internally coned ends into which the packing is held by mechanical pressure, the packing consisting of a ring of solid resilient material of wedge shaped cross section at each end of the sleeve having one of its wedge-shaped edges engaging the coned end of the sleeve and its other wedge-shaped edge engaging a gland provided with means for effecting pressure thereon axially, the wedge-shaped edges entering the coned end of the sleeve being provided therein with spaced lips and a reenforcing element on the adjacent surfaces of said lips acting in conjunction with said lips as a fluid pressure packing while the remaining portion of the double wedge-shaped packing ring is held tight by the means for effecting axial pressure.



2,001,615
BAKING VESSEL
William Theodore Karten, Pittsburgh, Pa.
Application January 19, 1932, Serial No. 587,461
2 Claims. (Cl. 53—6)

1. In a device of the kind described, a cover member having a cylindrical peripheral portion provided with spaced ventilation holes, a pair of arcuate bands slidably mounted on the cylindrical portion of the cover member and having spaced ventilation openings, said bands being movable to bring their ventilation openings into and out of registry with the openings in the cover member, said bands having adjacent ends, and out turned ears on said adjacent ends forming finger grips for simultaneous grasping between the thumb and the fore-finger of the same hand.

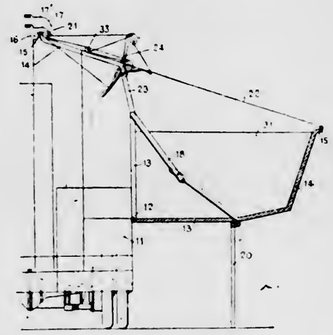


2,001,616
PACKING PLATE WITH SCREEN LINING AND PROCESS FOR MANUFACTURING SAME
Karl Klinger, Gumpoldskirchen, near Vienna, Austria, assignor to Naamlooze Vennootschap Irma Industrie en Ruwmaterialen Maatschappij, Rotterdam, Netherlands, a corporation of the Netherlands
Application September 30, 1932, Serial No. 635,707
In Germany January 30, 1932
1 Claim. (Cl. 91—70)

A process for the manufacture of packing plates having a wire grid coated with plastic mass comprising, rolling on a heated calender and under high pressure a thin layer of the plastic mass, introducing between the calender rolls along with more of said mass a grid of uncoated metal wires of narrow mesh and forcing said grid into

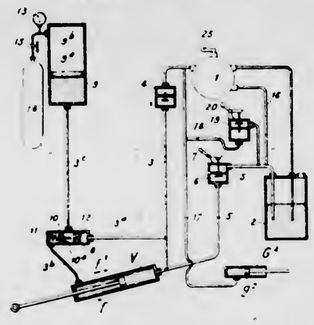
the thin layer of plastic mass, and rolling a thin layer of the plastic mass on top of the grid, the total amount of plastic mass being only sufficient to fill the meshes of the grid and convert its opposite faces into smooth surfaces.

2,001,617
COLLAR PROTECTING DEVICE
William Jacob Lanyon, Hanover, N. H.
Application July 2, 1934, Serial No. 733,505
1 Claim. (Cl. 223—18.6)



A collar protecting device comprising an elongated strip of bendable material having a straight end and a longitudinally extending row of spaced transverse slits in one side portion thereof, the slits extending inwardly from one side edge, each pair of slits forming a tongue adapted to be bent at right angles to the strip to form an abutment for said straight end of the strip to prevent contraction of the strip when the same is bent into substantially circular form to place in a collar, said strip also having a longitudinally extending row of substantially V-shaped slits in an intermediate part thereof, the V-shaped slits being spaced apart and forming substantially triangular-shaped tongues, any one of which is adapted to overlap said straight end of the strip.

2,001,618
BUCKLE
Alfred Laurain, Paris, France, assignor to Société du Caoutchouc Manufacturé, Paris, France
Application March 16, 1934, Serial No. 715,970
In France March 27, 1933
10 Claims. (Cl. 24—191)

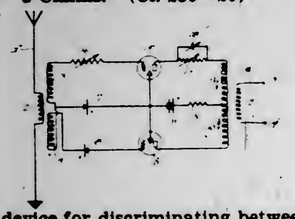


1. A buckle comprising a yoke, a flat anti-friction cross strip connecting the sides thereof and defining two contiguous co-planar slots for the respective engagement of two straps slidable through said yoke, said cross strip being intercalated flatly between the contiguous reaches of the straps located in the slots for preventing mutual contact of said strap reaches, and a flap pivotally connected at one end to the yoke sides, this flap freeing the strap engaged through the slot adjacent its pivotal connection in one angular position and clamping said strap in said slot in another angular position.

2,001,619
MOTOR CAR WITH TRAILER FOR CAMPING
Antoine Marie Louis Levoyer, Paris, France
Application April 1, 1932, Serial No. 602,578
In France, April 3, 1931
1 Claim. (Cl. 296—23)

A trailer having a lower portion, a cap and vertical sides and a solid roof, the side and half the solid roof being hinged to said lower portion to move as a unit, a roller near the middle of the top of the trailer beneath said cap and a canvas fabric carried by the roller and normally rolled up thereon but adapted to be unrolled from said roller and attached to the outer edge of the turned down side of the roof portion, when the side is turned to horizontal position said cap being movable to allow ventilation to said trailer.

2,001,620
RETRACTABLE LANDING GEAR FOR AEROPLANES
René Lucien Lévy, Montrouge, France, assignor to Societe d'Inventions Aeronautiques et Mechaniques S. I. A. M., Fribourg, Switzerland
Application August 8, 1934, Serial No. 739,043
In France March 27, 1934
7 Claims. (Cl. 244—2)



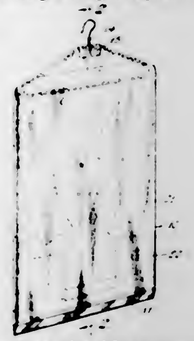
1. A system of landing gear for aeroplanes, comprising a generator of fluid under pressure, a hydraulic jack connected to the said generator and to an exhaust conduit, a connection between the landing gear and the movable element of this hydraulic jack, a pressure fluid accumulator connected to this hydraulic jack, a hydraulic blocking device interposed between said jack and said accumulator and connected to the pressure fluid generator.

2,001,621
TREATMENT OF ARTIFICIAL FIBROUS MATERIAL
Leon Lilienfeld, Vienna, Austria
No Drawing. Application September 26, 1928, Serial No. 308,589. In Great Britain November 21, 1927
19 Claims. (Cl. 8—20)

1. A process for increasing the extensibility and contraction of artificial fibers of regenerated cellulose, wherein the artificial fibers are treated with an alkali solution and carbon disulphide in the neck, a garment hanger comprising in part material to occur.

2,001,622
METHOD OF AND MEANS FOR REDUCING ELECTRICAL DISTURBANCES
David G. McCaa, Lancaster, Pa.
Application October 27, 1930, Serial No. 491,582
3 Claims. (Cl. 250—20)

1. In a device for discriminating between electrical waves of different amplitudes, two electrical paths operative with respect to the source of said waves, a thermionic device in each of said paths, means biasing one of said devices beyond output current cut-off an amount comparable to the peak value of waves of predetermined amplitude, and means for opposing to each other the waves passing through said paths, whereby waves of greater amplitude than said predetermined amplitude substantially cancel each other.



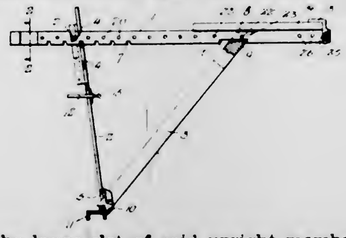
2,001,623
INSERT FOR UMBRELLAS
Hiram W. Montgomery, Topanga, Calif.
Application June 26, 1934, Serial No. 732,523
5 Claims. (Cl. 135—35)

1. A window opening insert comprising a pair of frames, screen means extending across the frames, means for clamping the frames together with the screen means therein, and a trough formed with one of said frames.

2,001,624
GARMENT BAG
William M. Moore, Maywood, Ill.
Application May 24, 1933, Serial No. 672,661
2 Claims. (Cl. 206—7)

1. In a "Cellophane" garment bag comprising a tubular body having a closed end provided with an open neck, a "Cellophane" reenforcing member fastened to the inside walls defining the neck and having an opening aligned with the opening in the neck, a garment hanger comprising in part a hook member and two angularly arranged reaches, a "Cellophane" covering for the load bearing parts of the garment hanger and shaped to conform to the angular reaches and having an opening receiving the hook member, the neck of said garment bag being shaped to conform to

the inclined reaches of said garment hanger, the said covering fitting snugly within the neck with the covering bearing against the inclined portions substantially throughout their entire length, and a "Cellophane" reenforcing strip slit to receive the hook portion and cemented to the outer surfaces of the neck, to reenforce the area surrounding the opening therein.

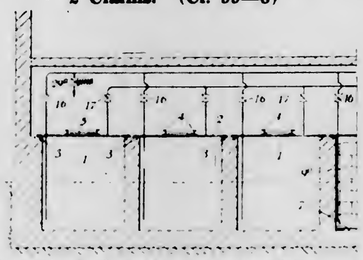


2,001,625
WHEELED TOY
Heinrich Müller, Nuremberg, Germany
Application February 23, 1935, Serial No. 7,919
In Germany September 17, 1934
14 Claims. (Cl. 46—48)

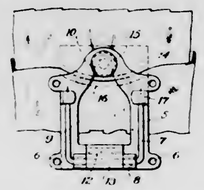
1. A wheeled toy having the form of an automobile, animal or the like, comprising a toy-body, a clock-work mounted therein, a pair of running wheels mounted on said toy-body, at least one of said running wheels being in driving connection with said clock-work, a turning wheel arranged in front of said running wheels positioned transversely with respect thereto and in driving connection with said clock-work, and a supporting finger with an obliquely ascending surface adapted to form a support for said toy-body and to lift said turning wheel off the running surface, said running wheel being made from rubber, leather or similar soft material adapted to provide sufficient adhesion to the running surface or at least being provided with a rim or tire made of such material.

2,001,626
WINDOW JACK
Menno Neinhouse, Muskegon, Mich.
Application December 6, 1934, Serial No. 756,339
4 Claims. (Cl. 304—33)

1. In a glazier's window jack, provided with a horizontal member, an upright member, and a strut member; said upright member having an upper slot and a lower slot, said horizontal member engaging said upper slot and having an outer notch, and an inner notch engaging said upright member, said strut member having an upper fork embracing said horizontal member and an upper tooth engaging the outer end wall of said outer notch, said strut member engaging the lower slot of said upright member and having a lower notch also engaging the upright member.

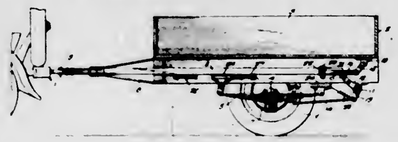


2,001,627
CLOSURE FOR DISPENSING CONTAINERS
William C. Nenstiehl, Wilmington, Del.
Application July 3, 1934, Serial No. 733,640
7 Claims. (Cl. 221—60)



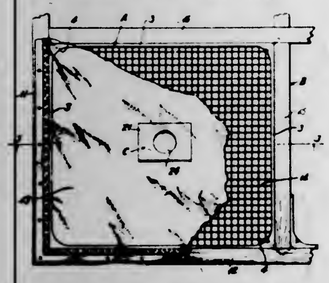
1. The combination with a container having a ported projecting portion constituting a discharge nozzle, of a closure element in the form of a hood secured to said container and embracing said nozzle, said hood being adjustable between alternative positions in one of which positions one side of the hood overlies and seals the discharge port of the container and in the other of which position uncovers said port for discharge of the contents of the container, said hood in the last named position of adjustment forming with said nozzle a substantially closed chamber embracing the discharge port and having an opening arranged for communication with said chamber to permit escape of the contents of said container through the chamber.

2,001,628
METHOD FOR PRESERVING FOODSTUFFS
Fernand Nierinck, Riverside, Chelmsford, England, assignor to Chelmsford Egg Supply Company (1934) Limited, London, England
Application December 16, 1931, Serial No. 581,480
In Denmark March 19, 1931
2 Claims. (Cl. 99—8)



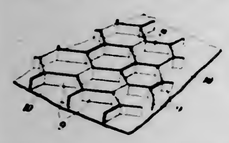
1. A method of preserving eggs which consists in placing them in an autoclave, evacuating the latter to remove the air from the eggs, replacing the evacuated air in the eggs by a preserving gas, removing the eggs through the atmosphere from the autoclave, and storing the eggs in the presence of a preserving gas at substantially atmospheric pressure, the eggs during the removal from the autoclave to the place of storage being protected from contained gas leakage solely by the inhibition of the shell of the egg to such leakage.

2,001,629
GARMENT SUPPORTER
Alfred D. Quasso, San Antonio, Tex., assignor of one-fourth to Stephen Paul Daily, Jr., New York, N. Y.
Application August 6, 1934, Serial No. 738,696
3 Claims. (Cl. 24—73)



1. A device of the character described comprising a first member adapted to be attached to a trousers, a second member hingedly attached to the lower end of the first member and including a flap at its upper end bent over toward the first member, the latter having a slot and the flap being provided with a button adapted to be held in said slot, said second member including a bead just below the end of said flap and on the same side of the second member, said bead and said flap being so related as to grip a portion of a garment when said button is engaged in said slot.

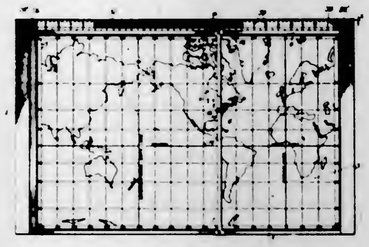
2,001,630
BRAKE
Percy Pepper, Fort Wayne, Ind.
Application May 1, 1934, Serial No. 723,383
2 Claims. (Cl. 188—112)



1. In combination with a trailer having ground wheels provided with brakes, a draft tongue mounted to the trailer for a limited sliding movement relative thereto, means for connecting the tongue to a motor vehicle, a shaft journaled to the trailer, depending arms integral with the shaft, means connecting the arms to the brakes, an arm integral with the shaft and arranged angularly to the first-named arms, and an operating mechanism between the tongue and the second-named arm and connected to the trailer for automatically applying and releasing the brakes during the increase or decrease of speed of travel of the trailer relative to the motor vehicle, and to maintain the brakes in released position during the backing of the trailer by said motor vehicle.

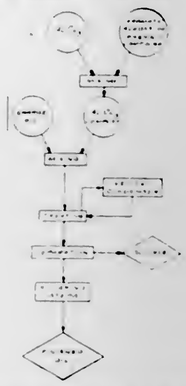
2,001,631
SIEVE LINER
Harry B. Rice, Houston, Tex., assignor to Vacuum Belting Cloth Cleaner Corporation, Houston, Tex., a corporation of Delaware
Application September 19, 1933, Serial No. 690,140
4 Claims. (Cl. 209—382)

1. A liner for sieves comprising an integral frame-like body of rubber composition adapted to be secured to the inner surface of a sieve frame, and having relatively thin flexible side and end walls and relatively thick corners rounded on their inner surfaces.



2,001,632
INSULATION AGAINST LOSSES OF HEAT AND COLD
Otto Schlichting, Berlin-Steglitz, Germany
Application March 27, 1934, Serial No. 717,584
In Germany November 20, 1930
7 Claims. (Cl. 154—45)

1. An insulation construction adapted for use as a spacing member, comprising a flexible body formed from an integral flexible sheet comprising thin metal having bright and reflective surfaces, said flexible body being cut and folded to form a reticulated structure having branches or arms and connecting bridges, the branches or arms being of substantially the same thickness as the integral sheet and the bridges being of substantially double the thickness of the sheet.

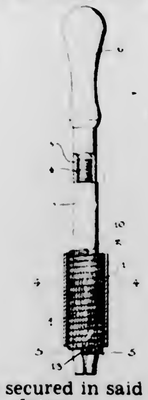


2,001,633
GEOGRAPHICAL CLOCK
Crispin B. Segovia, New York, N. Y.
Application September 22, 1934, Serial No. 745,147
2 Claims. (Cl. 58—43)

2. A geographical clock including a housing having an opening in one face, a map of the world carried by the housing and exposed through said opening, a top bar extending across said housing adjacent the upper end of said map, a bottom bar extending across said housing adjacent the bottom of said map, a slide bar slidingly mounted by said top and bottom bars so that said slide bar may freely slide back and forth over said map, a pointer slidingly mounted on said slide bar, a pointer carried by said slide bar at the upper end, an endless tape positioned to travel across said opening and near said last-mentioned pointer, said tape having sets of number and graduations indicating hours and parts of hours of several days, twenty-four

hours being disclosed in said opening at all times, and clock mechanism connected with said tape for driving the same at the proper speed.

2,001,634
PETROLEUM PRODUCT
Donald R. Stevens, Pittsburgh, and William A. Gruse, Wilkinsburg, Pa., assignors to Gulf Refining Company, Pittsburgh, Pa., a corporation of Texas
Application December 1, 1931, Serial No. 578,412
12 Claims. (Cl. 196—54)



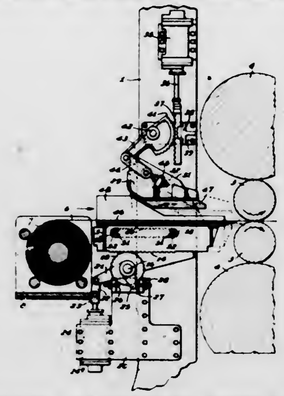
1. In the improvement of petroleum distillate and residual oils, the process which comprises treating such an oil at temperatures ranging from about 65° to 480° C. with a small proportion of a mixture of anhydrous aluminum chlorid and an added organic moderating agent selected from a class consisting of phenolic compounds and their homologues, said organic moderating agent being added in amount sufficient to substantially restrain the activity of said aluminum chloride.

2,001,635
REAMING TOOL
Charles E. Sturgis, Rochester, N. Y.
Application February 21, 1933, Serial No. 657,874
Renewed October 15, 1934
10 Claims. (Cl. 15—104.16)

1. A tool of the character described comprising a stem having a transverse perforation therein and also having a relatively long longitudinal slot spaced from and leading from adjacent said perforation to and through one end of the stem, and a metallic strand spirally wound around the

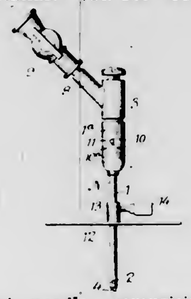
stem and over said longitudinal slot and having one end secured in said perforation and having

its opposite end secured in said slot adjacent the outer end of the latter.



2,001,636
TERMINAL FOR ELECTRICAL CONDUCTORS AND THE LIKE
Cecil W. Sward, Chicago, Ill., assignor to G & W Electric Specialty Co., Chicago, Ill., a corporation of Illinois
Application October 18, 1933, Serial No. 694,087
5 Claims. (Cl. 247—6)

1. A device of the class specified having an oil seal comprising a gasket member fitting between a tubular insulator and a tubular metallic member containing an end portion of said insulator, said gasket member having a tubular portion surrounding the insulator and a flange portion extending outwardly between shoulders on the insulator and metallic surrounding member, and cement material located in the space between the tubular insulator and surrounding tubular member below the tubular portion of the gasket.

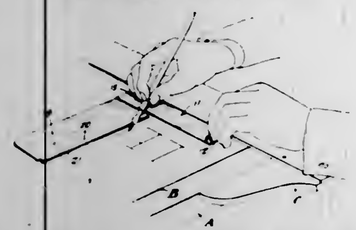


2,001,637
ROLLING MILL FEEDING APPARATUS
Howard H. Talbot, Pittsburgh, Pa., assignor to United Engineering & Foundry Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application January 11, 1933, Serial No. 651,153
27 Claims. (Cl. 80—43)

1. A combined sticker, drag and leveling apparatus for use with a rolling mill, comprising a table adapted to be reciprocably mounted in horizontal alignment with the roll pass of the mill, a plurality of transversely extending rolls mounted in spaced parallel relation in the top of said table, a roll-supporting frame mounted above said table, a plurality of transversely extending rolls mounted in parallel spaced relation in said frame with their axes lying between the axes of the rolls mounted in said table, forming a wave-like stock working pass between said two sets of rolls means for moving said frame toward and away from said table whereby adapting it to clamp a piece of stock when disposed between said rolls and resist the movement

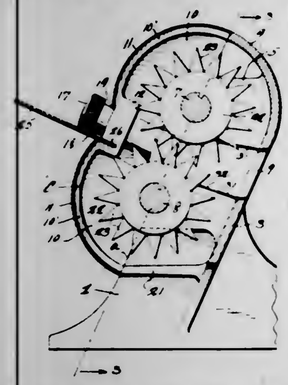
therethrough, and means for moving said table and frame toward the mill to forcibly feed stock so clamped and held by said sets of rolls to the mill, the mill after biting the material, pulling the same through said sets of rolls which then act as a drag and leveling apparatus.

2,001,638
SURGICAL NEEDLE
Gustaf Elof Tornsjo, Columbia, Mo., assignor to Research Foundation, Inc., Columbia, Mo., a corporation of Missouri
Application November 14, 1932, Serial No. 642,637
Renewed March 14, 1935
4 Claims. (Cl. 128—347)



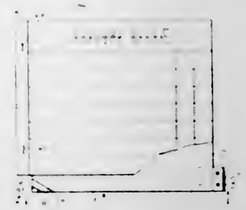
1. A surgical needle, comprising an outer tubular member having a perforation; an inner tubular member having a flesh cutting knife and having a perforation adapted to register with that in the outer member when the knife is retracted within the outer member.

2,001,639
SILVER SOLDER
Harold Turner, Sheffield, England, assignor to Johnson Matthey & Company Limited, London, England, a British company
No Drawing. Application January 26, 1934, Serial No. 708,499. In Great Britain March 17, 1933
3 Claims. (Cl. 75—1)



1. A silver solder especially suitable for joining tarnish-resisting silver alloys which consists of 60 to 85% of silver, the following metals in the proportions as stated: 1 to 9% of tin and 15 to 30% of zinc.

2,001,640
LETTERING GUIDE
Harry S. Van Heefen, St. Louis, Mo.
Application March 5, 1934, Serial No. 714,133
2 Claims. (Cl. 33—75)

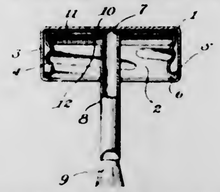


1. An instrument of the kind described comprising a pair of pivotally connected legs having straight guiding edges, one of said legs being formed with a crimp longitudinally thereof to present an elevated free end edge with respect to the plane of said legs, an offset ear formed on one of the legs to bring both legs in a common plane, a friction pivot swingingly connecting the legs together, and a rolled end formed on the other of said legs.

2,001,641
MEAT TENDERER
Frank W. West, Bellefonte, Pa.
Application June 21, 1934, Serial No. 731,775
4 Claims. (Cl. 17—26)

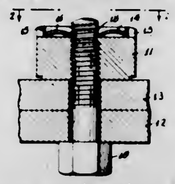
1. A device of the class described comprising a member having side plates, an interposed back plate connecting said side plates and provided between the side plates with a discharge opening, the forward edges of the side plates having their upper portions straight and disposed on an inward and upward angle with respect to the vertical, said straight edges at points spaced therealong being provided with bearing recesses, shafts engaging within said recesses and bridging the space between the side plates, a cap member having head plates having straight edges butting the straight edges of the side plates, said head plates of the cap member also having bearing recesses in the straight edges to engage over the shafts within the recesses of the side plates, means coacting with the head plates of the cap member and the side plates for holding the cap member in place, penetrating members carried by the shafts between the side plates and connected for unitary rotation, and means for rotating the shafts, the cap member having a feed opening.

2,001,642
MANIFOLDING SHEET
Walter R. Whitley, Methuen, Mass.
Application May 5, 1934, Serial No. 724,165
4 Claims. (Cl. 282—28)



1. A device of the character described comprising, in combination, a plurality of superimposed manifolding sheets, strips of relatively stiff material secured to one edge of said sheets and superimposed with relation to each other, said strips projecting beyond the manifolding sheets at one end and having their other ends disposed in progressively staggered relation, and means for securing the projecting ends of said strips together.

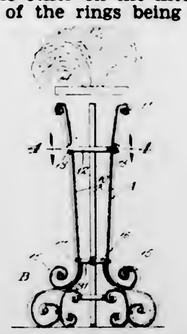
2,001,643
METHOD OF FORMING GOLF SHAFTS AND THE LIKE
Hallie M. Wilcox, Geneva, Ohio, assignor to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio
Original application October 3, 1930, Serial No. 486,178. Divided and this application January 17, 1933, Serial No. 652,184
8 Claims. (Cl. 29—156)



1. The method of forming a tubular shaft for golf clubs from a metal tube which includes infolding the wall of the tube to substantially uniform depth at circumferentially spaced intervals and longitudinally over a portion of the length of the tube proceeding from one end, and drawing the tube to taper it toward the said end and close up the folds to produce inwardly radially extending longitudinal ribs substantially continuous in cross-section.

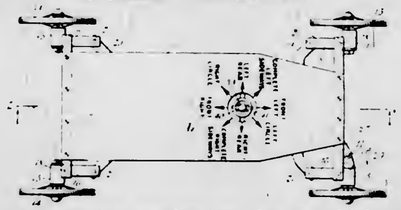
2,001,644
COMBINATION CAP AND SPREADER
John J. Williams, Wheeling, W. Va., assignor to Hazel-Atlas Glass Co., Wheeling, W. Va., a corporation of West Virginia
Application May 18, 1932, Serial No. 612,076
Renewed November 20, 1934
3 Claims. (Cl. 91—67.2)

1. A combination bottle cap and spreader including an inner shell having a top and a depending skirt, container engaging means provided on the skirt, an outer shell having a top and a depending skirt, the outer shell encompassing the inner shell and turned inwardly about the inner shell to hold the two shells against relative rotation, the outer shell being smooth throughout to simulate a molded cap, the top of the inner shell provided with an opening to receive the shank of the spreader, the spreader shank terminating within the shells, a flange provided at the top of the spreader shank, and said flange clamped between the tops of the inner and outer shell.



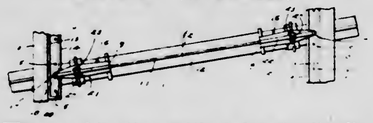
2,001,645
LOCKING DEVICE FOR NUTS, SCREWS, BOLTS, AND THE LIKE
Henry Clark Abell, Interlaken, N. J.
Application June 27, 1934, Serial No. 732,601
6 Claims. (Cl. 151—30)

1. In a lock nut construction, the combination of a bolt, a nut on said bolt having a counter-bore at its outer face, a curved washer slidable over the threads of said bolt and non-rotatively connected with said bolt, said curved washer being arcuate shape in radial cross section and having the inner and outer diameters initially on a common plane, and adapted to have its inner and outer diameters clamped against the walls of said bolt and bore respectively when pressed flat in said counter-bore.



2,001,646
DUPLEX STAND
George Abitsch, San Francisco, Calif.
Application October 3, 1934, Serial No. 746,742
3 Claims. (Cl. 248—41)

3. A stand of the character described comprising duplex article holding sections and adapted for interfitting one with the other, means for separably locking the sections when interfitted with each other and also functioning for the fastening of an article in one of the sections on the separation of said sections, and rings carried by the respective sections and one received in the other on the interfitting of the sections, one of the rings being provided with



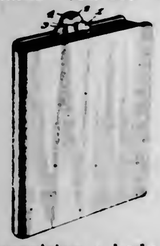
bayonet slots opening through one edge of said ring and removably receiving the locking means.

2,001,647
STEERING MECHANISM
Eugene C. Alt, Brooklyn, N. Y.
Application June 29, 1934, Serial No. 733,139
9 Claims. (Cl. 280—91)

1. In steering mechanism for a vehicle, the combination with front and rear traction and steering wheels of the vehicle, of steering gear connected with said wheels, said gear including slotted lever means, a manually operable control element, and means mounting said element for universal movement, the lower end of said element being slidably engaged in the slots in said lever means.

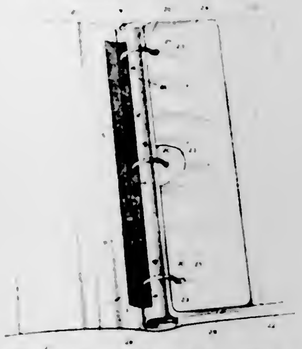
2,001,648
BLADE SUPPORTING MEANS FOR ROAD SCRAPERS
Franklin E. Arndt, Galion, Ohio, assignor to The Galion Iron Works & Mfg. Co., Galion, Ohio, a corporation of Ohio
Application August 26, 1930, Serial No. 477,876
6 Claims. (Cl. 37—143)

1. The combination with a longitudinally extending supporting beam having an outwardly projecting flange, a scraper disposed beneath the supporting beam, of means for clamping the scraper and the supporting beam comprising a clamping member having at one end a head engaging over the scraper and at the other end provided with an apertured head, a pin passing through the apertured head and engageable with said flange, and means on the clamping member for engaging the scraper and drawing it upward against the under face of the beam and flange and against the head of the clamping



member, said flange on the beam having an upwardly extending guard flange within which the apertured head of the clamping member is disposed.

2,001,649
SUBMERGIBLE ELECTRIC MOTOR
Armais Arutunoff, Bartlesville, Okla., assignor to Reda Pump Company, Bartlesville, Okla.
Application October 20, 1933, Serial No. 694,509
14 Claims. (Cl. 172—36)



12. In a submergible electric motor unit, a gas chamber, a motor in said gas chamber, bearings for said motor, a motor shaft, a protecting fluid chamber above said gas chamber and surrounding a portion of said shaft, stuffing boxes around said shaft adjacent the upper and lower extremities of said fluid chamber, means in said fluid chamber for creating therein a pressure greater than that of the submergence pressure, whereby there is a constant tendency for said protecting fluid to slightly exude along said shaft from both extremities of said fluid chamber, means interposed between said fluid chamber and gas chamber for intercepting any fluid exuded from the lower extremity of said fluid chamber, at least a portion of said shaft being hollow, said hollow portion being provided with radial passageways arranged adjacent said bearings, means for forcing a lubricating fluid through the hollow portion of said shaft to said bearings, and means for returning said lubricating fluid for recirculation.

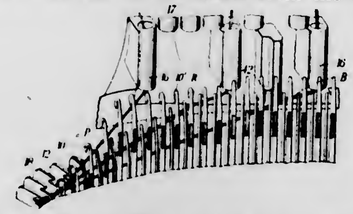
2,001,650
BOOKMARK
John N. Bane, South Boston, Va.
Application September 19, 1933, Serial No. 690,158
1 Claim. (Cl. 116—119)

A marker comprising a body shaped to form a finger grip at one edge thereof, relatively spaced and parallel fingers formed integrally with the edge of the body opposite to the edge having the finger grip and each divided into a series of spaces and the spaces of each finger bearing a different character, said fingers having pairs of oppositely arranged notches with the notches of each pair arranged at opposite edges of the fingers, and endless elastic elements surrounding the fingers and each movable from one pair of notches to another pair of notches.

2,001,651
PROTECTOR FOR COVERS OF LOOSE LEAF BINDERS
Frederick C. Bingham, New York, N. Y., assignor to Boorum & Pease Company, Brooklyn, N. Y., a corporation of New York
Application May 28, 1934, Serial No. 728,003
9 Claims. (Cl. 129—24)

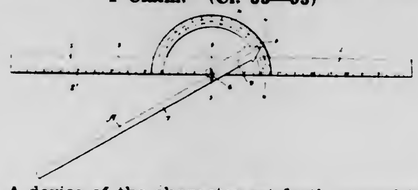
1. A device for protecting a cover of a loose leaf binder from rings of said binder, comprising strips hingedly connected, one strip being perforated to receive and fit closely about the circumference of the wire comprising rings of a loose leaf binder, and the other strip being somewhat rigid.

2,001,652
HOOK GUARD
James H. Bird, San Antonio, Tex.
Application August 14, 1934, Serial No. 739,830
2 Claims. (Cl. 43—46)



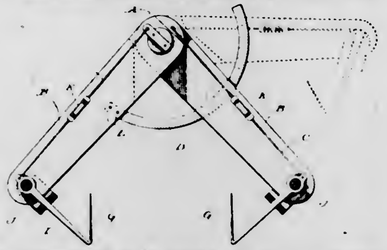
1. A hook guard for artificial bait, comprising a base member including apertured ears, an outer member including apertured ears and cooperating with the first mentioned ears for securing the guard to the body of the bait, means included in the outer member to pivotally receive the hook means, lugs formed on the base member to limit lateral and rearward movement of the hook means, and means included in the outer member to limit forward movement of the hook means so that the latter cannot contact the body.

2,001,653
REVERSE PLATING
John Howard Booton and Herman Booton, Leicester, England
Application February 14, 1934, Serial No. 711,252
In Great Britain July 30, 1932
19 Claims. (Cl. 66—90)



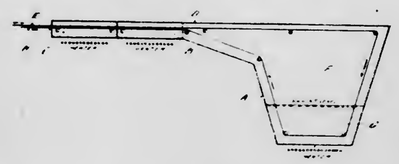
1. That process of producing plating and reverse plating upon a series of hooked needles which comprises feeding at least three threads

to the needles, in a plating relation, and in knitting three threads in said relation at certain wales, changing said relation at other wales by positively separating the thread that is to appear at the face of the fabric from the others



and maintaining such separation during loop formation, knitting the three threads in such wales in said changed relation, making a further change in the plating relation, and knitting at least one loop from threads in said further relation.

2,001,654
ANGLE INDICATOR
Thomas C. Burrows, Wink, Tex.
Application September 17, 1934, Serial No. 744,407
1 Claim. (Cl. 33—93)



A device of the character set forth comprising an angle iron member providing portions arranged at right angles to each other, one of said portions at its free edge having a scale of twenty-four inches, said member having recesses, an arcuately curved protractor plate secured in said recesses and provided with a protractor scale, an indicator pivoted in said member and movable over the protractor plate, a tail piece integral with the pivoted end of the indicator and of a width equal to one-half of the width of the indicator, said other portion of the tail piece providing a straight edge.

2,001,655
TURPENTINE-FACE SCRIBE
Thomas N. Busch, Lake City, Fla.; dedicated to the free use of the Public
Application July 15, 1933, Serial No. 680,577
1 Claim. (Cl. 33—41)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

A turpentine-face scribe, of the character described, comprising a plurality of arms pivoted together at one end; handles mounted at the opposite end of said arms; shields carried by said handles; cutting blades pivotally mounted on said arms and near said handles, said blades having their cutting edges extended toward a common point, and means adapted to maintain said relative position of the blades as said arms are adjusted.

2,001,656
PROCESS AND APPARATUS FOR REDUCING SOLVENT LOSSES IN FABRIC CLEANING
Rudolf von Grüber-Rehenbürg and Robert Stöbe, Munich, Germany, assignors to Dr. Alexander Wacker Gesellschaft für Elektrochemische Industrie G. m. b. H., Munich, Germany, a corporation
Application August 25, 1934, Serial No. 741,526
In Germany August 9, 1933
6 Claims. (Cl. 68—38)

4. Process for the reduction of solvent losses in the treatment of a length of material with volatile solvents in continuous operation comprising passing the incoming and outgoing portions of the material through an enclosed space in close proximity and parallel to each other before and after treatment with the solvent and heating said portions while in such close proximity to each other to transfer solvent from the outgoing material to the incoming material.

2,001,657
ELECTRIC LAMP RECEPTACLE
Henry K. Wack, New Bedford, Mass., assignor to John I. Paulding, Inc., New Bedford, Mass., a corporation of Massachusetts
Application September 13, 1932, Serial No. 632,931
8 Claims. (Cl. 177—311)

1. An electric lamp receptacle comprising an insulating body provided with a recess, said recess having a diametrical slot in its two opposite sides and bottom, said slot opening out on one side of said body, a U-shaped contact fastened in said recess, said contact having the inner edges of its two arms corrugated to fit the threaded end of an electric lamp and to hold it in said recess and having one of its arms provided with a wing extending outwardly through said side opening and carrying a binding screw for the attachment of a lead wire thereto, and a lamp contact mounted on the side of said body and extending through a side hole in said insulating body into said recess.

2,001,658

DRYING PARA-HYDROXYDIPHENYL

William H. Williams, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Michigan

No Drawing. Application July 12, 1934, Serial No. 734,822

2 Claims. (Cl. 260—154)

1. In a method for the dehydration of para-hydroxydiphenyl, the step which consists in feeding said compound to a substantially anhydrous mass thereof maintained in the molten condition.

2,001,659

PREPARATION OF FORMIC ACID

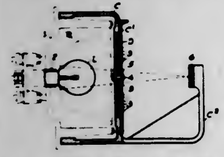
John C. Woodhouse, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application November 11, 1932, Serial No. 642,239

10 Claims. (Cl. 260—114)

1. In a process for the preparation of formic acid from carbon monoxide and steam the step which comprises effecting the reaction in the presence of a volatile inorganic acid catalyst which is continuously formed in situ.

10. In a process for the preparation of formic acid from carbon monoxide and steam the step which comprises passing carbon monoxide, steam, and a non-metal, which reacts with water to form acids, into the reaction.



2,001,660

TESTING DEVICE AND METHOD FOR SIGNAL LIGHT REFLECTORS

Karl W. Abendroth, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application July 31, 1931, Serial No. 554,272

7 Claims. (Cl. 88—14)

1. In testing means for elliptical reflectors, in combination, a casing, means in the casing for receiving in elliptical reflector in a predetermined position therein and a light source at the principal focus of the reflector, a target positioned at the conjugate focus of the reflector, and a fixed disc having a plurality of minute apertures therein positioned between the light source and the target and a movable disc movably positioned over the fixed disc and having apertures therein which can be selectively alined with the apertures in the fixed disc upon movement of the movable disc, said fixed disc being opaque and having its apertures radially spaced, said movable disc being opaque and rotatably mounted on the fixed disc and having its apertures radially and angularly spaced therein, whereby to completely scan the surface of the reflector with respect to light rays passing from the reflector to the target.

2,001,661

CONCRETE PUMPING SYSTEM

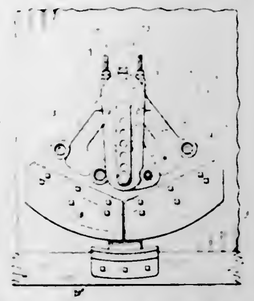
Charles F. Ball, Milwaukee, Wis., assignor to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin

Application April 6, 1933, Serial No. 664,827

3 Claims. (Cl. 103—224)

1. The combination with a pump for concrete and similar plastic materials having valve controlled inlet and outlet passages which at certain times in the operation of the pump may be simultaneously open, and a pulsation damping device, of longitudinally extended connections between said pump and device arranged to contain a quantity of the material being pumped

sufficient that the inertia thereof and the friction between said material and the walls of said connections may over-come the back pressure exerted by said damping device and prevent backslip of said material in said passages when they are simultaneously open.



2,001,662

COUNTERBALANCING DEVICE

Richard R. Bloss and Roy C. Pfeil, Columbus, Ohio, assignors, by mesne assignments, to International-Stacey Corporation, Franklin, Ohio, a corporation of Ohio

Application April 6, 1928, Serial No. 268,028

10 Claims. (Cl. 74—591)

10. In a well-pumping mechanism, a crank shaft, a crank arm mounted on said crank shaft, a counterbalance weight structure, means for suspending said counterbalance weight structure from said crank shaft and in juxtaposition to said crank arm, said suspending means being adjustable to raise said counterbalance weight structure or to lower it relative to said crank arm, and means other than said weight suspending means for attaching said weight structure directly to said crank arm when said crank arm and said weight are in proper relation to each other at any of a plurality of circumferential positions relative to said crank arm.

2,001,663

HEATER

Carl T. Carlson, Erie, Pa., assignor to Erie City Iron Works, Erie, Pa., a corporation of Pennsylvania

Application October 17, 1932, Serial No. 638,191

3 Claims. (Cl. 257—224)

1. In a heater, the combination of a case having an inlet and discharge; a tube plate at the bottom of the case having openings with beveled tube seats therein; a tube plate at the top with openings therein; tubes extending into the openings in the top plate and, said tubes having surrounding edges at their bottom ends seated on

the beveled surfaces of the seats in the bottom plate; and inlet and exhaust chambers outside of

the tube plates with which the tubes communicate.

2,001,664

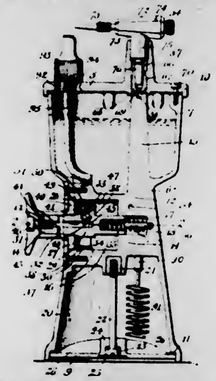
METHOD OF MAKING CELLULAR CLAY PRODUCTS

Harry D. Foster, Logan, Ohio, assignor to National Fireproofing Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Application June 15, 1933, Serial No. 675,972

5 Claims. (Cl. 25—156)

1. The method of making cellular clay material which comprises, grinding clay to a fine grain size, subjecting the clay to a calcination temperature, mixing the dry clay with a gas generating material and then with a dilute acid, agitating said mixture until it attains a smooth, creamy consistency, allowing interaction between the gas generating material and acid to produce a cell forming gas throughout the entire body of the mixture, and subjecting the cellular clay mass to a firing temperature.



2,001,665

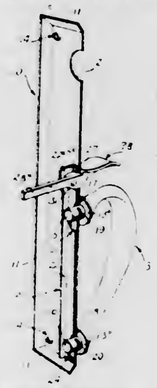
DENTAL BLOWTORCH

Edmond J. Franwick, Buffalo, N. Y., assignor to Hanau Engineering Company, Inc., Buffalo, N. Y., a corporation of New York

Application July 28, 1932, Serial No. 625,321

12 Claims. (Cl. 158—27.5)

1. A dental torch, comprising a casing having a plunger cylinder between its ends with its axis at an angle thereto, an air chamber and a fuel chamber separated by said plunger cylinder, a piston plunger within said plunger cylinder, conduit connection between said plunger cylinder and said air chamber, an air-escape nozzle, conduit connection between said air chamber and said air-escape nozzle, and means for maintaining a flame in the path of the air escaping from said nozzle.



2,001,666

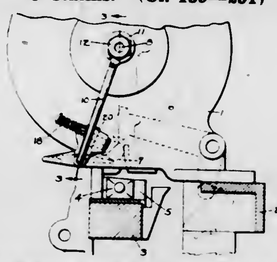
ESCUTCHEON PLATE AND HANDLE ASSEMBLY

Henry F. Keil, Scarsdale, N. Y., assignor to Francis Keil & Son, Inc., a corporation of New York

Application February 27, 1933, Serial No. 658,698

4 Claims. (Cl. 16—125)

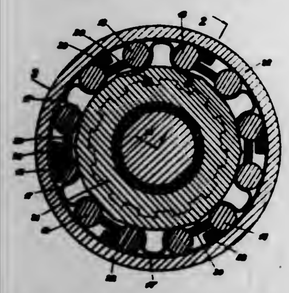
3. In a latch construction, in combination, an escutcheon plate having a hole therein and an aperture spaced therefrom, a handle resting against the front face of said plate and having a portion extending through said aperture, a part on the other face of said plate and having means whereby upon relative movement between said part and said portion of said handle said part interengages with said portion to prevent withdrawal of said handle from said plate and whereby said part is secured against said other face of said plate, and a latch lever supported by said part, said latch lever passing through said hole in said plate and thereby preventing relative movement between said part and said portion of said handle and thereby locking these elements against disengagement.



2,001,667

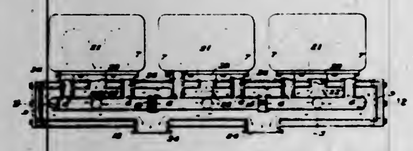
BOBBIN SUPPORTING DEVICE

Riley G. Lackey, New Holland, Ga., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine



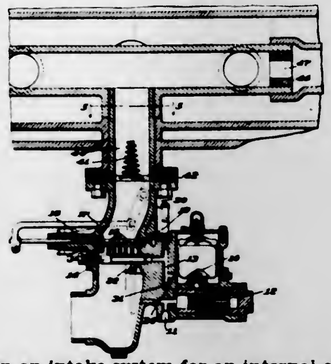
Application November 23, 1934, Serial No. 754,513

5 Claims. (Cl. 139—251)



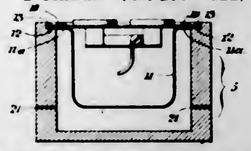
1. A supporting device for the bobbin support of a bobbin changing loom, said device being comprised of a rod having an integral eye at its upper end which eye is adapted to engage the axial stud of a rotary hopper, the lower end of said rod being turned into parallelism with the axis of said eye and constituting a combined support and bearing for the bobbin support.

2,001,668
FREEWHEELING CLUTCH
Albert Maier, Friedrichshafen, Germany, assignor to Zahnradfabrik Friedrichshafen Aktiengesellschaft, Friedrichshafen, Bodensee, Germany
Application November 29, 1933, Serial No. 700,201
In Germany, December 12, 1932
1 Claim. (Cl. 192—48)



A free-wheeling clutch comprising: an inner rotatory member; an outer rotatory member; rollers between said members; one of said rotatory members having a smooth annular surface facing said other rotatory member; the other one of said rotatory members having wedge-shaped surfaces, half of said wedge-shaped surfaces being inclined in clock-wise direction, the other half being inclined in anti-clock-wise direction; springs inserted in every other space between two adjacent rollers of said rollers, said springs being adapted to press said rollers upward along the slope of said wedge-shaped surfaces so as to cause driving connection between both said rotatory members in both driving directions; members projecting between said rollers, and means for moving said projecting members in annular direction, thereby pressing every other one of said rollers downward the slope of the respective wedge-shaped surfaces and a loose cage inserted between said rollers, adapted to limit the maximum distance between every pair of said rollers pressed apart by said springs.

2,001,669
MANIFOLD
Walter S. Smith, Quincy, Mass., assignor to Shore Corporation, Dover, Del., a corporation of Delaware
Application March 28, 1932, Serial No. 601,649
15 Claims. (Cl. 123—52)



1. In an inlet manifold for a multi-carburetor engine having cylinders arranged in line, a lateral header having pairs of outlet branches leading therefrom and separate inlet conduits leading thereto from the respective carburetors, each of said inlet conduits entering the header between the members of a pair of said outlet branches, said header being provided with means between pairs of outlet branches to check surging of fuel therein.

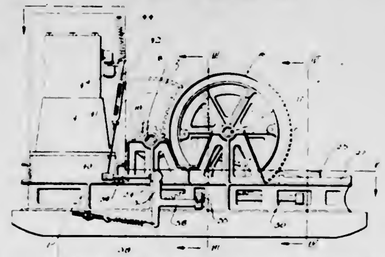
2,001,670
INTAKE SYSTEM FOR MULTICYLINDER INTERNAL COMBUSTION ENGINES
Walter S. Smith, Quincy, Mass., assignor to Shore Corporation, Dover, Del., a corporation of Delaware
Application July 7, 1933, Serial No. 679,411
48 Claims. (Cl. 123—122)

1. In an intake system for an internal combustion engine, an intake pipe, carburetor nozzles including an idling nozzle in said intake pipe, a throttle adapted to open and close at least some of said nozzles successively and to vary correspondingly the air opening around said nozzles, the intake pipe being otherwise unthrottled, and a resistance element adapted to be heated electrically and located in said intake pipe beyond the throttle in the path of the liquid fuel as it is drawn from the idling nozzle, whereby in starting the engine the vacuum caused by cylinder suction may be maintained in the intake system to the idling nozzle and liquid fuel may be drawn from said nozzle at high velocity, thrown against said resistance element, heated and vaporized at reduced pressure.

2,001,671
PORTABLE ELECTRIC CURRENT TAP DEVICE
John Villa, Philadelphia, Pa., assignor to Max W. Bieberbach, Jr., Philadelphia, Pa.
Application September 3, 1932, Serial No. 631,661
1 Claim. (Cl. 177—311)

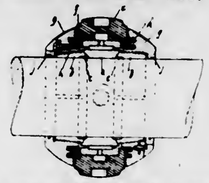
A portable electric current cap device comprising a block of combustible material having a longitudinal recess in one face thereof and having open grooves formed in the longitudinal walls thereof adjacent said recess, said block also having ventilating apertures in the opposite longitudinal walls thereof, a unitary metal shield extending the entire length of said recess and having a depressed central portion co-extensive therewith and extending into said recess and spaced from the longitudinal walls thereof for purposes of ventilation, said shield having integral lateral flanges extending into the longitudinal grooves in said block and secured thereto, a manually operable switch device having metallic supporting portions extending partially over the integral flanges of said shield and secured thereto, a socket mounting having metallic supporting portions extending partially over the integral flanges of said shield and secured thereto, a current flow indicating bulb in said socket mounting, an attachment receptacle having metallic supporting portions extending partially over the integral flanges of said shield and secured thereto, a cover plate adapted to fit over said block and secured to said metallic supporting portions of said switch device, said socket mounting and said attachment receptacle, said cover plate having spaced openings therein through which said switch device and said attachment receptacle are accessible and a jewel mounted thereon and through which said current flow indicating bulb is visible, and an electric cord connected to said switch device, said attachment receptacle and said socket and having means for connection to a wall outlet or other source of electric current.

2,001,672
LIGHT-SENSITIVE CELL
Arthur W. Carpenter, New York, N. Y., assignor to United Research Corporation, New York, N. Y., a corporation of Delaware
Application September 20, 1930, Serial No. 483,263
1 Claim. (Cl. 201—63)



A light-sensitive cell comprising a plurality of pairs of electrodes and layers of sensitive material cooperating therewith, in cooperative relation to a single transparent support said electrodes comprising means adapted to reflect light to and between said sensitive layers.

2,001,673
SUBMARINE LIFESAVING OUTFIT
Robert Henry Davis, London, England
Application October 16, 1933, Serial No. 693,877
5 Claims. (Cl. 128—191)



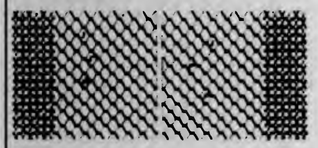
1. A self-contained submarine escape breathing outfit comprising, in the form of a complete preassembled unit, an inflatable breathing bag occupying in the donned outfit a vertically disposed position in front of the wearer's chest, a mouthpiece, a shut-off valve therein, a breathing tube connection between the mouthpiece and the breathing bag, means for re-conditioning the air breathed into the breathing bag, an inflatable buoyancy chamber capable of maintaining the wearer of the outfit afloat in the event of the breathing bag becoming flooded, a readily breakable capsule of compressed gas located in readiness for use within the buoyancy chamber for the inflation of the latter and capable of being broken by manual pressure applied to it through the flexible wall of the chamber, the said chamber being a completely closed chamber in the sense herein specified and the capsule within it containing a quantity of compressed gas not greater than is sufficient fully to inflate the chamber at external atmospheric pressure.

2,001,674
AUTOMATIC GAS ENGINE CONTROL FOR HOISTS
Einar Erickson, Chicago, Ill., assignor, by mesne assignments, to John Howard McElroy, Chicago, Ill.
Application July 23, 1926, Serial No. 124,395
Renewed October 19, 1934
5 Claims. (Cl. 187—2)

1. In a hoisting apparatus, the combination with an engine and a throttle valve for controlling its speed, of a clutch shaft, a drum shaft, a pair of drums having friction brakes and brake bands attached thereto loosely mounted on said drum shaft, gearing between the engine and the clutch shaft, shiftable clutch mechanism on the clutch shaft, duplex gearing between the clutch mechanism and the drums, a cable wound on the drums, cages on the ends of the cable, guiding means for the cables and cages, a central cable associated with the guiding mechanism, a brake-band rock-shaft, a clutch-shifting rock-shaft, connections between the brake-band rock-shaft and the clutch-shifting rock-shaft to cause them to rock together, an arm on the brake-band rock-shaft, and a link from said arm to the throttle valve, substantially as and for the purpose described.

2,001,675
CLOSED REMOVABLE NEEDLE BEARING
Georg Eisgruber, Nuremberg, Germany
Application August 27, 1932, Serial No. 630,683
In Germany May 15, 1931
4 Claims. (Cl. 308—236)

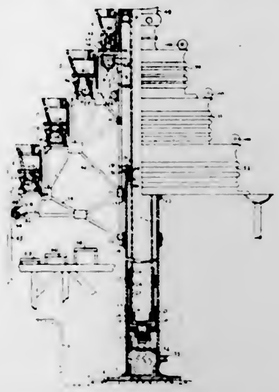
1. In a closed removable needle bearing a supporting hub, comprising a rigid supporting ring



and a resilient cone at least on one side of said supporting ring having an annular recess in its inner surface directly adjacent said supporting ring.

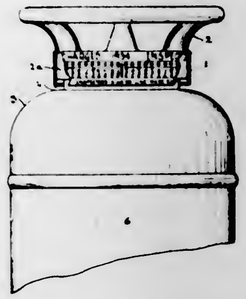
2,001,676
STOCKING
Gustav Gastrich, Wyomissing, Pa., assignor, by mesne assignments, to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania
Application October 12, 1931, Serial No. 568,533
4 Claims. (Cl. 66—202)

1. As a new article of manufacture, a knitted stocking made from yarn consisting of three or more filaments united by braiding the same over and under each other in sinous paths.



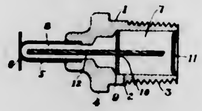
2,001,677
WIRE BELT
Fraslen Michael Gere, Oaklyn, N. J., assignor to Audubon Wire Cloth Corporation, Audubon, N. J., a corporation of New Jersey
Application March 22, 1934, Serial No. 716,913
23 Claims. (Cl. 245—6)

1. A belt made of helically twisted interlocking wires coiled in one direction having a selvage made up of short helically twisted interlocking wires coiled in another direction and interlaced with the end portions of the interlocking belt wires.



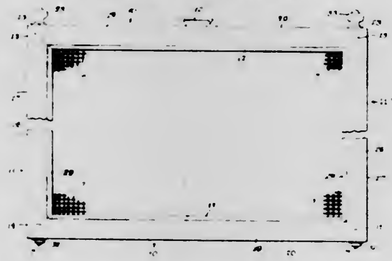
2,001,678
STAGE APPARATUS
Robert Lewis Gelb, Los Angeles, Calif., assignor to Warner Bros. Pictures, Inc., New York, N. Y., a corporation of Delaware
Application February 28, 1934, Serial No. 713,350
3 Claims. (Cl. 20—1.123)

1. A theatrical platform for motion pictures comprising a plurality of concentric telescoping stages, a hydraulic display system individual to each of said concentric stages, means for successively extending and telescoping said stages, said means comprising a hydraulic lift, and means for rotating said stages, said last-mentioned



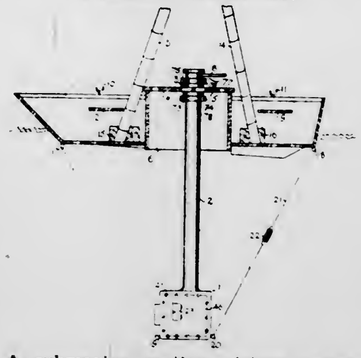
means comprising a motor and gear train individual to each of said stages.

2,001,679
INSPECTION TAG FOR FIRE EXTINGUISHERS
Frank E. Haughey, Philadelphia, Pa., assignor to said Frank E. Haughey and Martha A. Haughey, his wife, as tenants by the entireties, both of Philadelphia, Pa.
Application May 28, 1934, Serial No. 727,999
7 Claims. (Cl. 40—21)



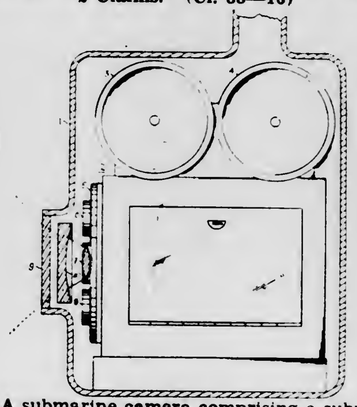
5. In combination, a fire extinguisher having a main body portion, a mouth portion therein and a cap, having a hub adjacent the mouth of the extinguisher, removably enclosing said mouth portion and an annular ring of stiff material, bearing a set of inchoate date marks, being placed around said extinguisher between the cap and main portion thereof, said ring being of such diameter and depth that at least the upper portion thereof encircles the hub of said cap, having said inchoate date marks located in the said upper portion thereof, having a signature-receiving area on the inside wall thereof, and having a turned-in flange on the lower edge thereof, the diameter of said ring being not substantially greater than the diameter of the said hub of said cap, thereby requiring removal of the cap as a prerequisite to the completion of an inspection indication on said ring.

2,001,680
ACTUATOR FOR FIRE PROTECTION SYSTEMS
Henry Ernest Heigis, West Orange, N. J., assignor to Walter Kidde & Company, Inc., Bloomfield, N. J., a corporation of New York
Application December 12, 1933, Serial No. 702,089
12 Claims. (Cl. 116—105)



5. An actuator for use in a fire protective system comprising a chambered body member and adapted to be connected for use in the fire protective system, a hollow member of inflammable material closed at one end and adapted to communicate at its other end with the chamber of the first named member and to form a substantially air-tight seal therewith, said hollow member being so disposed as to constitute an element projecting from said chambered member, a fuse member disposed substantially centrally of the hollow member and the chambered body member and extending from a point adjacent the closed end of the hollow member to a point adjacent the remote end of the chambered body member, an ignitible gas forming charge surrounding said fuse member and substantially filling said hollow member and said chambered body member, and easily displaceable means normally closing the remote end of the chambered body member so as to normally retain the gas forming charge within the actuator.

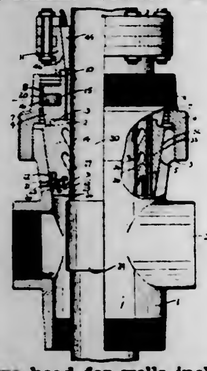
2,001,681
SCREEN CORNER CONSTRUCTION
Elbridge G. Huff, Malden, Mass., assignor to Cutter Manufacturing Company, Cambridge, Mass., a corporation of Massachusetts
Application March 22, 1933, Serial No. 662,106
7 Claims. (Cl. 126—202)



1. In a corner construction for a screen or the like, a pair of adjacent frame members which are channel-shaped with their wings directed inwardly and their webs outwardly, the web of one member being provided with slots and an opening therebetween and the wings of the other member being provided with tongues each of which has a notch in its free end edge, said tongues being inserted into said slots, respectively, and bent into engagement with the web of the slotted member, the notches leaving the opening uncovered, a rod the end of which projects through the opening in the slotted member, and a fastening element secured to the rod in engagement with the notched tongues.

2,001,682
SUBMARINE CAMERA
Fred W. Jackman, Beverly Hills, Calif., assignor to Warner Bros. Pictures, Inc., New York, N. Y., a corporation of Delaware
Application July 5, 1932, Serial No. 620,825
2 Claims. (Cl. 88—16)

1. A submarine motion picture camera arrangement comprising the combination of a boat, a well therein, a gimbal bearing mounted on said boat adjacent said well, a tube depending from said bearing, a casing connected to the lower end of said tube and containing therein a motion picture camera with its film supply and take-up reels, the size of said well being sufficient to permit hoisting said tube and said casing above the water line to change the film supply and take-up reels in said casing.



2,001,683
SUBMARINE CAMERA
Fred W. Jackman, Beverly Hills, Calif., assignor to Warner Bros. Pictures, Inc., New York, N. Y., a corporation of Delaware
Application August 26, 1932, Serial No. 630,568
2 Claims. (Cl. 88—16)

1. A submarine camera comprising a submersible water-tight casing, a camera therefor, an objective lens in said camera, a window in said casing in front of said lens, a reducing lens adjacent said objective lens and located between said objective lens and said window, the reducing power of said reducing lens being so related to the magnifying power of the water in which said camera is submerged that distant submerged objects photographed by said camera appear to

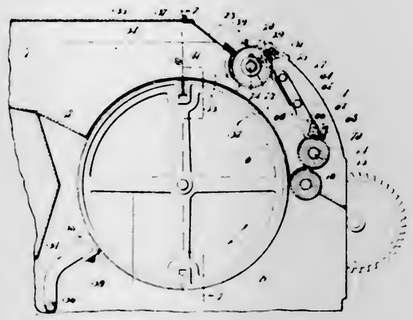
have a size comparable with the size they would have in air if positioned at the same distance from the camera.

2,001,684
PRESSURE HEAD FOR OIL WELLS
Edwin A. Johnson, Houston, Tex., assignor, by mesne assignments, to Frank J. Hinderliter, Tulsa, Okla.
Application June 13, 1930, Serial No. 460,855
Renewed August 5, 1931
33 Claims. (Cl. 166—14)

1. A pressure head for wells including a well casing, a casing head thereon having a downwardly tapered seat, a packing member therein adapted to fit said seat and seal about an inner pipe, said member including upper and lower rings having openings sufficiently large to permit the passage of a pipe coupling, a rubber gasket between said rings, said gasket having annular undercut recesses on its inner surface to provide downwardly curved lips to engage said pipe, and means to secure said rings to said gasket.

2,001,685
PHOTOTUBE
Duff C. Law, deceased, late of Philadelphia, Pa., by Janet F. Law, administratrix, Philadelphia, Pa., assignor to United Research Corporation, Long Island City, N. Y., a corporation of Delaware
Application November 30, 1931, Serial No. 578,016
4 Claims. (Cl. 250—27.5)

4. A photo-electric tube comprising a plurality of sets of electrode surfaces, one electrode surface of each set being photosensitive, said photosensitive surfaces being responsive to different frequency ranges respectively.

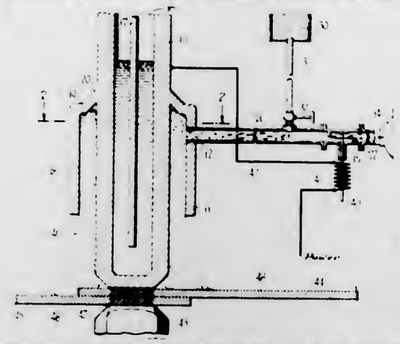


2,001,686
FUSIBLE SAFETY DEVICE
Robert H. Moore and Russell B. Allen, Lexington, Mass., assignors to J. W. Moore Valve Corporation, Everett, Mass., a corporation of Massachusetts
Application April 23, 1932, Serial No. 607,112
3 Claims. (Cl. 122—504.1)

1. A relief valve comprising a body having a chamber therein and a liquid discharge outlet leading therefrom, a fusible plug in said discharge outlet adapted to melt at a predetermined temperature in said chamber, a carrier for said plug, said body having an opening therein communicating with said chamber diametrically opposite said discharge outlet for insertion and removal of said carrier and plug, and means cooperating

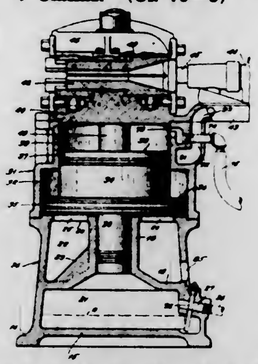
with said carrier to seal said opening, said carrier and plug being so proportioned that when said opening is sealed by said carrier, said plug will have a sealing fit in said discharge outlet, said carrier having a recess therein remote from said chamber and adapted to house a similar fusible plug.

2,001,687
PICKER
Joseph Moss, Woonsocket, R. I., assignor, by mesne assignments, to Whitin Machine Works, Whitinsville, Mass., a corporation of Massachusetts
Application July 7, 1930, Serial No. 465,999
29 Claims. (Cl. 19—156)



1. A picker having, in combination, a single condenser, a casing around the condenser cooperating therewith to define a fiber-chamber, stripping means, means for drawing a current of air through the fiber chamber and the condenser to deposit fibers from the air current and to form a sheet on the condenser, and means cooperating with the casing and the condenser for preventing access of fiber-laden air to the sheet on a portion of the condenser where the air currents are directed inwardly of the condenser.

2,001,688
METHOD OF WELDING
James J. Paugh, Philadelphia, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application May 28, 1932, Serial No. 614,166
4 Claims. (Cl. 219—4)

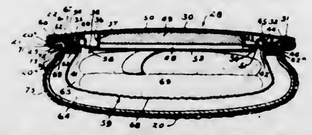


4. The combination of a spot welding electrode and cooling means including an orifice arranged

to discharge a jet of a cooling fluid toward the

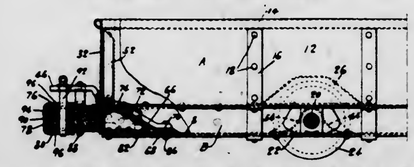
electrode, and means arranged to release said jet in synchronism with the flow of welding current.

2,001,689
DRILL SHARPENER
Gustav C. Pearson, Denver, Colo., assignor to Gardner-Denver Company, Denver, Colo., a corporation of Delaware
Application January 24, 1931, Serial No. 510,980
7 Claims. (Cl. 76—5)



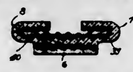
1. In a metal working machine, a base and a fluid actuated work engaging element thereon, means controlling the flow of fluid to and the exhaust from said element, an exhaust-expansion chamber within the base receiving the exhaust from said element, said element being adjacent to and in communication with said chamber, and said element being actuated partly by the exhaust during its expansion period.

2,001,690
VANITY CASE
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application March 15, 1932, Serial No. 598,910
14 Claims. (Cl. 132—82)



1. In an article of the class described, in combination, means forming a substantially circular metallic ring including an annular downwardly depending flange, and a lined metallic mesh pouch having its edge portion secured to said flange.

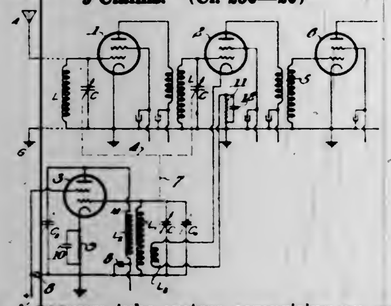
2,001,691
VANITY CASE CONSTRUCTION
Alfred F. Reilly, North Attleboro, Mass.
Application April 4, 1932, Serial No. 602,910
15 Claims. (Cl. 132—82)



1. In an article of the class described, in combination, a ring substantially U-shaped in cross-section with the free ends facing inwardly, an annular member of thin but relatively stiff material secured in place between the said free ends of the ring, a flexible pouch of impervious material also secured between the free ends of the ring and below the said annular member, and a piece of pervious material constituting a sifter in said pouch and normally retained therein by said annular member.

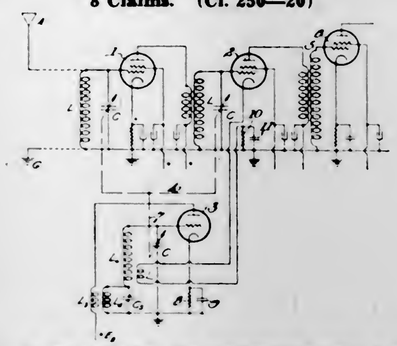
2,001,692
MINE CAR
Donald U. Rich, Teaneck, N. J., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application September 8, 1934, Serial No. 743,192
13 Claims. (Cl. 105—364)

1. In an end dump mine car, side sills, a floor secured to the lower portions of the side sills, and means for connecting the end portions of the side sills, said connecting means replacing the usual end sill and comprising a unitary metal member between and connected to the sills and connected to the floor and formed to constitute a combined end sill and end deflector adapted to guide lading out of the car as the latter is tilted.



2,001,693
PROCESS OF MANUFACTURING PIPING, WELTING OR THE LIKE
Aaron W. Rockwood, Winchester, Mass., assignor to Haley, Cate, Rockwood Company, Everett, Mass., a corporation of Massachusetts
Original application December 17, 1932, Serial No. 647,774. Divided and this application December 15, 1933, Serial No. 702,494
2 Claims. (Cl. 154—2)

1. The improved process of making finishing strips, welting, or the like, which consists in coating a base with a finishing material, such as pyroxylin or the like, capable of subsequent softening, folding the edges thereof, preparing a second strip for adhesion thereto with a similar coating capable of softening on one side, and an adhesive on the opposite side, softening said similar coated sides by the application of a softening agent, bringing said softened surfaces into contact, applying pressure thereto, and thereafter

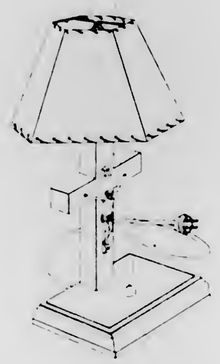


dividing the completed strip into two separate pipings, each with a folded edge and an adhesive portion.

2,001,694
OSCILLATOR CIRCUIT
Paul O. Farnham, Boonton, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application September 23, 1931, Serial No. 564,676
9 Claims. (Cl. 250—20)

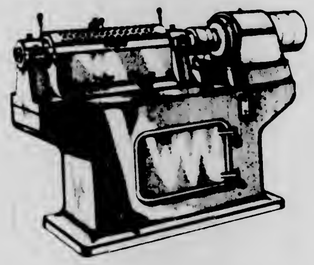
1. A vacuum tube system comprising an oscillator tube having grid and plate electrodes cooperating with a cathode, a pair of inductively coupled coils wound in the same direction, the two adjacent terminals at one end of said pair of coils being connected respectively to the grid and plate, the other two adjacent coil ends each having a connection to the cathode, an adjustable condenser shunted across the grid coil, and means comprising a condenser connected between plate and cathode for effecting a reversal of the phase of the alternating voltages developed at the grid and plate terminals of the coupled coils.

2,001,695
OSCILLATOR CIRCUIT
Paul O. Farnham, Boonton, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application January 8, 1932, Serial No. 585,592
Renewed March 16, 1934
8 Claims. (Cl. 250—20)



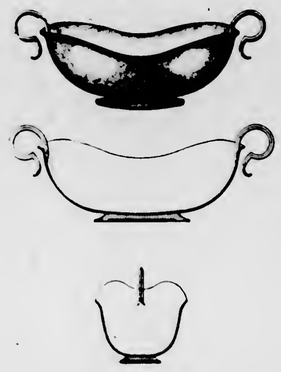
1. In an oscillator, the combination with a vacuum tube having plate and grid elements and a cathode; and a resonant circuit between cathode and grid comprising an inductance shunted by a series lagging condenser in series with a tuning condenser; the junction of said condensers having an oscillator-frequency connection to the cathode, and the junction of the inductance and tuning condenser being connected to the grid; of means coupling the plate circuit across said series lagging condenser, said means comprises a transformer having one winding in the plate circuit and a second winding shunted across said series lagging condenser.

DESIGNS



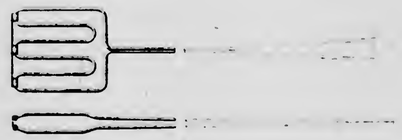
MAY 14, 1935

95,571
DESIGN FOR A LAMP
Charles T. Andrews, Montreal, Quebec, Canada, Assignor to Marvin Nelson, Montreal, Quebec, Canada
Application March 6, 1935, Serial No. 55,750
Term of patent 14 years



The ornamental design for a lamp as shown.

95,572
DESIGN FOR A SHAVING MACHINE
Michael Annick, Scranton, Pa., assignor to F. Wesel Manufacturing Company, Scranton, Pa.
Application February 6, 1934, Serial No. 50,649
Term of patent 14 years



The ornamental design for a shaving machine, as shown and described.

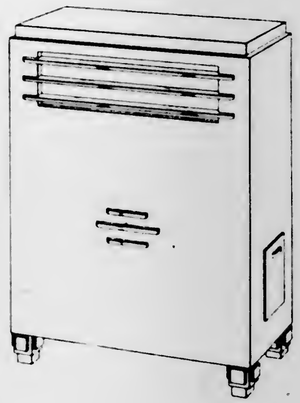
95,573
DESIGN FOR A DISH
Norman Bel Geddes, New York, N. Y., assignor to Revere Copper and Brass Incorporated, Rome, N. Y., a corporation of Maryland
Application February 13, 1935, Serial No. 55,390
Term of patent 7 years

The ornamental design for a dish, substantially as shown and described.

95,574
DESIGN FOR A GRILL UTENSIL
John L. Bennett and Stephen A. Platt, Decatur, Ill.
Application March 6, 1934, Serial No. 50,968
Term of patent 7 years

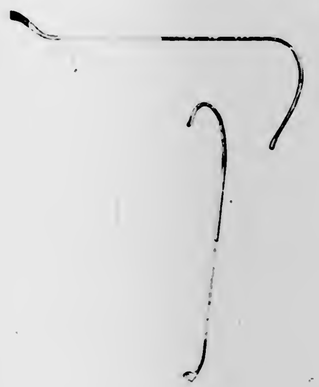
The ornamental design for a grill utensil as shown and described.

95,575
DESIGN FOR A CROCHETED BRASSIÈRE
Mayme E. Blood, Downers Grove, Ill., assignor to Collingbourne Mills, Inc., Elgin, Ill., a corporation of Illinois
Application March 21, 1935, Serial No. 55,984
Term of patent 3½ years



The ornamental design for a crocheted brassière as shown.

95,576
DESIGN FOR A BOTTLE
George M. Brenner, Oak Park, Ill.
Application February 8, 1935, Serial No. 55,319
Term of patent 7 years

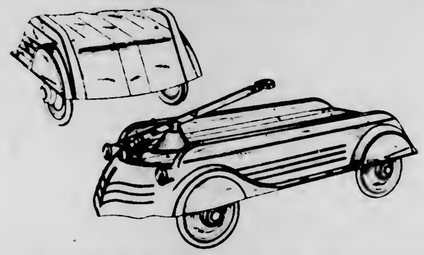


The ornamental design for a bottle, as shown.

95,577
DESIGN FOR A CONSOLE HEATER
Phil Brinckerhoff, Los Angeles, Calif., assignor to Payne Furnace & Supply Company, Inc., Beverly Hills, Calif., a corporation of California
Application March 5, 1935, Serial No. 55,733
Term of patent 7 years

The ornamental design for a console heater substantially as shown.

95,578
DESIGN FOR A SPECTACLE TEMPLE
Oswald B. Carson, Scarsdale, N. Y.
Application January 8, 1935, Serial No. 54,772
Term of patent 14 years



The ornamental design for a spectacle temple, as shown.

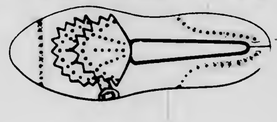
95,579
DESIGN FOR A GLASS PLATE OR ARTICLE OF SIMILAR NATURE
George S. Dunbar, Columbus, Ohio, assignor to The Federal Glass Company, Columbus, Ohio, a corporation of Ohio
Application March 12, 1935, Serial No. 55,853
Term of patent 14 years

The ornamental design for a glass plate or article of similar nature, as shown.

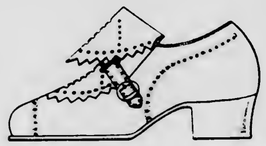
95,580
DESIGN FOR A COASTER WAGON
Joseph B. Eck, Sheboygan, Wis.
Application December 10, 1934, Serial No. 54,377
Term of patent 7 years

The ornamental design for a coaster wagon, substantially as shown.

95,581
DESIGN FOR TEXTILE FABRIC
Curt Erwin Forstmann, Montclair, N. J.
Application January 2, 1935, Serial No. 54,685
Term of patent 14 years

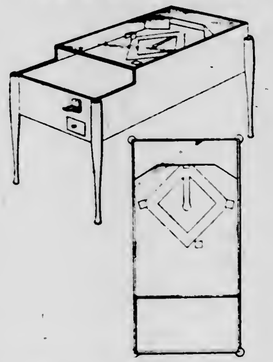


The ornamental design for textile fabric as shown and described.

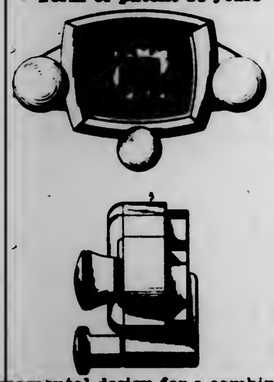


95,582
DESIGN FOR A VENDING MACHINE CASING
Benjamin W. Fry, St. Louis, Mo.
Application March 18, 1935, Serial No. 55,912
Term of patent 7 years

The ornamental design for a vending machine casing, as shown and described.

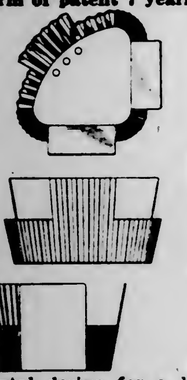


95,583
DESIGN FOR A SHOE
John A. Galway, New York, N. Y.
Application February 25, 1935, Serial No. 55,607
Term of patent 3½ years



The ornamental design for a shoe, substantially as shown.

95,584
DESIGN FOR A GAME APPARATUS
Leon M. Gibbs, Birmingham, Ala.
Application January 18, 1935, Serial No. 54,909
Term of patent 14 years

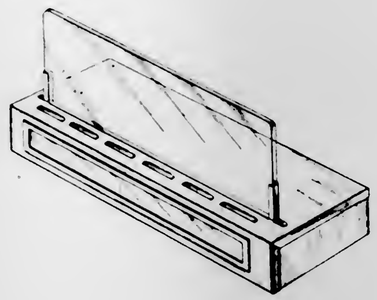


The ornamental design for a game apparatus, substantially as shown.

95,585
DESIGN FOR A COMBINED CONTROLLING AND INDICATING DEVICE FOR RADIORECEIVERS
Emil Herman, Philadelphia, Pa., assignor to Philco Radio & Television Corporation, Philadelphia, Pa., a corporation of Delaware
Application February 27, 1935, Serial No. 55,646
Term of patent 14 years

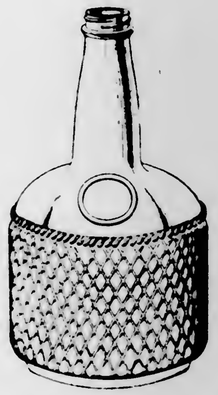
The ornamental design for a combined controlling and indicating device for radio receivers, substantially as shown.

95,586
DESIGN FOR A LINER FOR SINK STRAINERS
Harold C. Harvey, Sturgis, Mich., assignor to Harvey Paper Products Company, Sturgis, Mich.
Application March 2, 1935, Serial No. 55,686
Term of patent 7 years



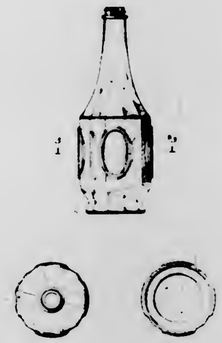
The ornamental design for a liner for sink strainers, as shown.

95,587
DESIGN FOR A FINGER RING OR THE LIKE
Nathan Hershau, New York, N. Y.
Application March 2, 1935, Serial No. 55,695
Term of patent 3½ years



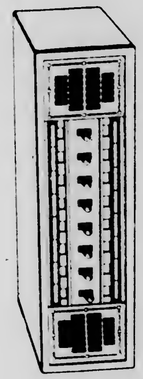
The ornamental design for a finger ring or the like substantially as shown.

95,588
DESIGN FOR AN ILLUMINATED ADVERTISING SIGN OR SIMILAR ARTICLE
Isidore Holsman, Chicago, Ill.
Application December 14, 1934, Serial No. 54,431
Term of patent 7 years



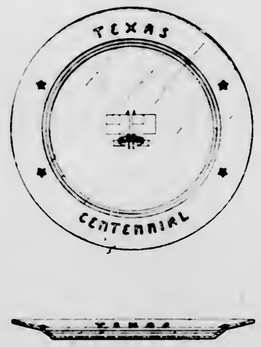
The ornamental design for an illuminated advertising sign or similar article, as shown.

95,589
DESIGN FOR A BOTTLE
Frank T. Kessler, Philadelphia, Pa., assignor to Continental Distilling Corporation, Philadelphia, Pa., a corporation of Delaware
Application December 19, 1933, Serial No. 50,111
Term of patent 14 years



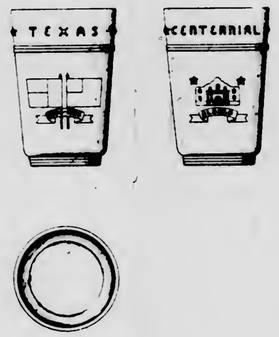
The ornamental design for a bottle, as shown and described.

95,590
DESIGN FOR A BOTTLE
Sidney Kessler, Brooklyn, N. Y., assignor to American Spirits, Inc., New York, N. Y., a corporation of Maryland
Application February 13, 1935, Serial No. 55,380
Term of patent 14 years



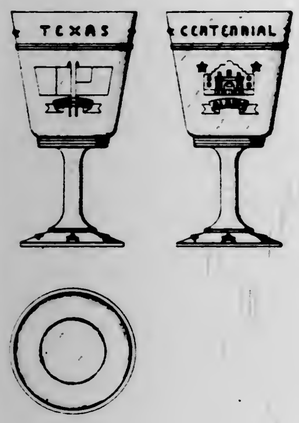
The ornamental design for a bottle as shown.

95,591
DESIGN FOR A CABINET FOR TELEPHONE EQUIPMENT
Henry Koch, Jamaica, N. Y., assignor to Dictograph Products Company, Inc., Jamaica, N. Y., a corporation of Delaware
Application March 13, 1935, Serial No. 55,867
Term of patent 3½ years



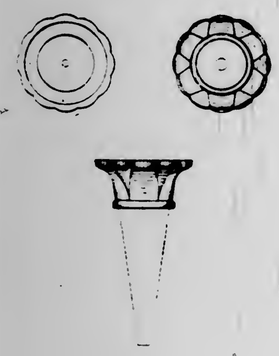
The ornamental design for a cabinet for telephone equipment, as shown.

95,592
DESIGN FOR A PLATE OR SIMILAR ARTICLE
Arthur L. Kramer, Dallas, Tex.
Application January 29, 1935, Serial No. 55,128
Term of patent 3½ years



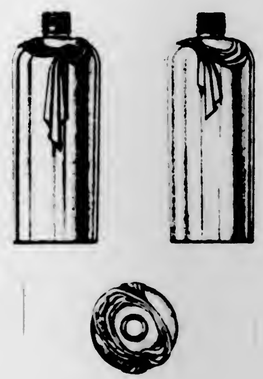
The ornamental design for a plate or similar article, as shown.

95,593
DESIGN FOR A TUMBLER OR SIMILAR ARTICLE
Arthur L. Kramer, Dallas, Tex.
Application January 29, 1935, Serial No. 55,129
Term of patent 3½ years



The ornamental design for a tumbler or similar article as shown.

95,594
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Arthur L. Kramer, Dallas, Tex.
Application January 29, 1935, Serial No. 55,130
Term of patent 3½ years



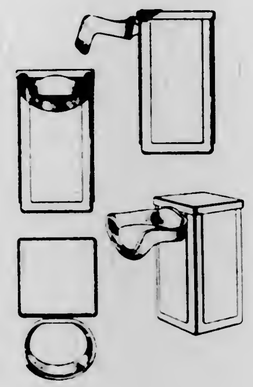
The ornamental design for a goblet or similar article, as shown.

95,595
DESIGN FOR A PASTRY CUP
Urban A. Kreidler, East Orange, N. J., assignor to National Biscuit Company, New York, N. Y., a corporation of New Jersey
Application March 14, 1935, Serial No. 55,882
Term of patent 14 years

The ornamental design for a pastry cup, as shown and described.

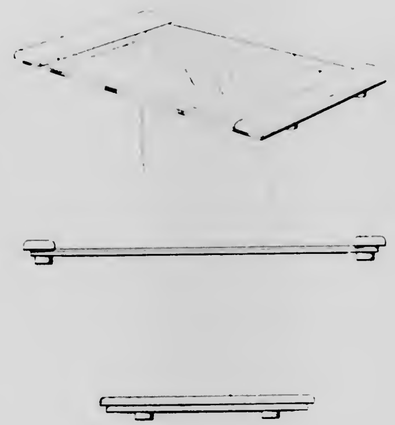
95,596
DESIGN FOR A BOTTLE
Florence N. Lewis, New York, N. Y.
Application February 20, 1935, Serial No. 55,522
Term of patent 14 years

The ornamental design for a bottle substantially as shown.



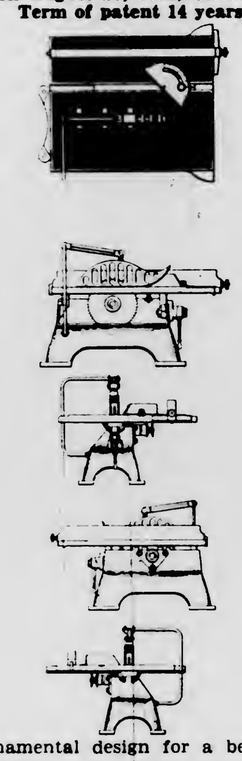
95,597
DESIGN FOR A DISPENSER FOR CUPS OR THE LIKE
Paul A. Lobel, New York, N. Y.
Application September 17, 1934, Serial No. 53,313
Term of patent 14 years

The ornamental design for a dispenser for cups or the like, as shown and described.



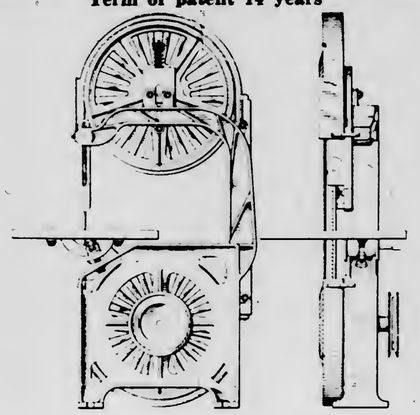
CARNEGIE LIBRARY OF ATLANTA

95,598
DESIGN FOR A MOUNTING FOR A HAND TELEPHONE
George R. Lum, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application January 17, 1935, Serial No. 54,895
Term of patent 14 years



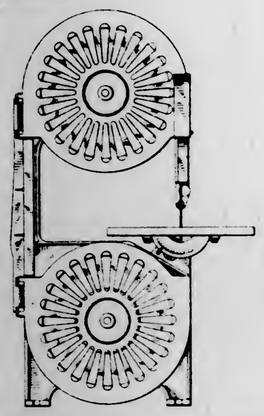
The ornamental design for a mounting for a hand telephone, as shown and described.

95,599
DESIGN FOR A TRAY
Leo Marder, Brooklyn, N. Y., assignor to Celluloid Corporation, a corporation of New Jersey
Application February 5, 1935, Serial No. 55,251
Term of patent 7 years



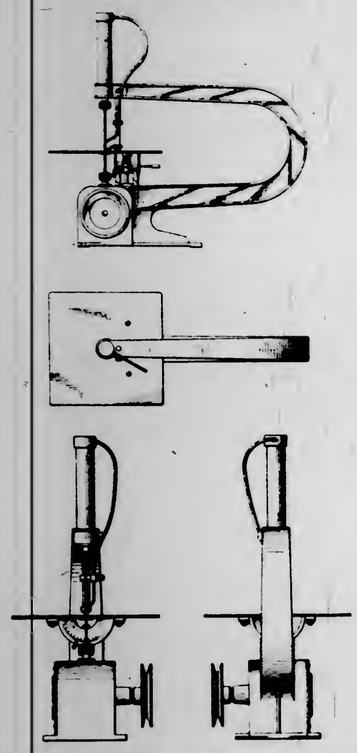
The ornamental design for a tray substantially as shown and described.

95,600
DESIGN FOR A BENCH SAW
William J. Merrigan, Los Angeles, Calif., assignor to Herberts Machinery Company, Ltd., Los Angeles, Calif., a corporation of California
Application August 27, 1934, Serial No. 53,081
Term of patent 14 years

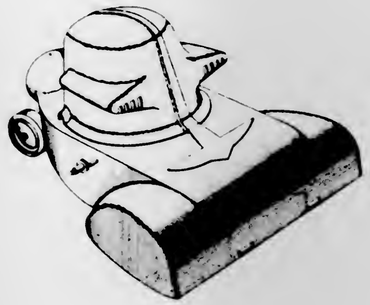


The ornamental design for a bench saw as shown.

95,601
DESIGN FOR A BAND SAW
William J. Merrigan, Los Angeles, Calif., assignor to Herberts Machinery Co., Ltd., Los Angeles, Calif.
Application January 23, 1935, Serial No. 55,018
Term of patent 14 years

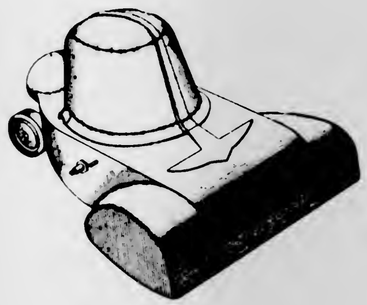


95,601—Continued



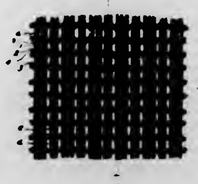
The ornamental design for a band saw as shown.

95,602
DESIGN FOR A JIG SAW
William J. Merrigan, Los Angeles, Calif., assignor to Herberts Machinery Co., Ltd., Los Angeles, Calif.
Application January 23, 1935, Serial No. 55,019
Term of patent 14 years



The ornamental design for a jig saw, as shown.

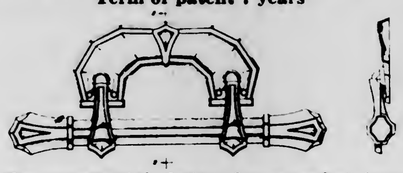
95,603
DESIGN FOR A CASING FOR VACUUM CLEANERS
John Richard Morgan, Oak Park, Ill., assignor to Birtman Electric Company, Chicago, Ill., a corporation of Illinois
Application March 11, 1935, Serial No. 55,836
Term of patent 7 years



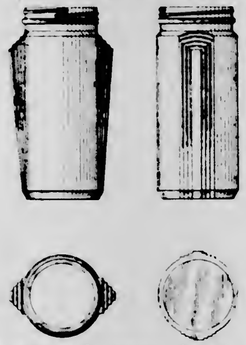
The ornamental design for a casing for vacuum cleaners, as shown.

95,604
DESIGN FOR A CASING FOR VACUUM CLEANERS
John Richard Morgan, Oak Park, Ill., assignor to Birtman Electric Company, Chicago, Ill., a corporation of Illinois
Application March 11, 1935, Serial No. 55,837
Term of patent 7 years

The ornamental design for a casing for vacuum cleaners, as shown.

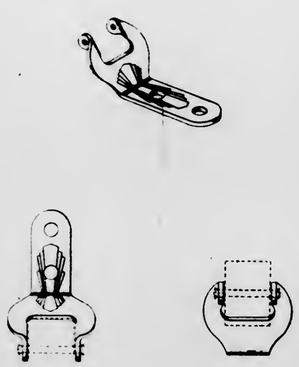


95,605
DESIGN FOR KNIT FABRIC
William Avery Neaves, Elkin, N. C., assignor to Chatham Manufacturing Company, Winston-Salem, N. C., a corporation of North Carolina
Application January 21, 1935, Serial No. 54,983
Term of patent 7 years



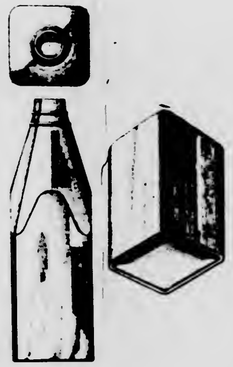
The ornamental design for a knit fabric as shown and described.

95,606
DESIGN FOR A CASKET HANDLE
Paul Lester Parsons, Belvidere, Ill.
Application March 13, 1935, Serial No. 55,869
Term of patent 7 years



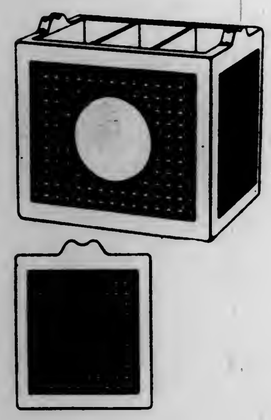
The ornamental design for a casket handle substantially as shown and described.

95,607
DESIGN FOR A GLASS JAR
Fred J. Petty, Muncie, Ind., assignor to Ball Brothers Company, Muncie, Ind., a corporation of Indiana
Application August 28, 1934, Serial No. 53,092
Term of patent 14 years



The ornamental design for a glass jar, as shown.

95,608
DESIGN FOR A WINDOW SILENCER
Arthur P. Pfeil, Buffalo, N. Y.
Application March 8, 1935, Serial No. 55,790
Term of patent 7 years

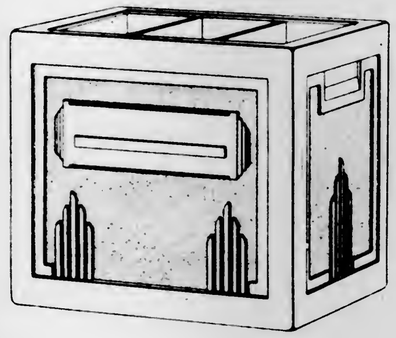


The ornamental design for a window silencer, as shown and described.

95,609
DESIGN FOR A BOTTLE
Paul Plunkett, Greenwich, Conn., assignor to Moulded Pulp Corporation, Dover, Del., a corporation of Delaware
Application September 22, 1934, Serial No. 53,372
Term of patent 14 years

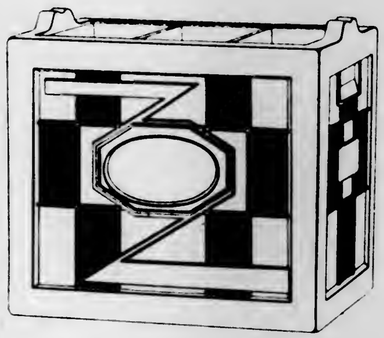
The ornamental design for a bottle as shown and described.

95,610
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application March 20, 1935, Serial No. 55,972
Term of patent 7 years



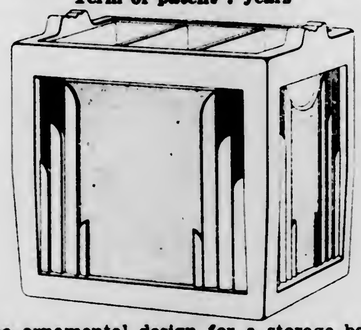
The ornamental design for a storage battery case, as shown and described.

95,611
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application March 20, 1935, Serial No. 55,974
Term of patent 7 years



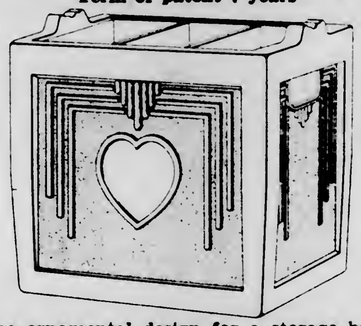
The ornamental design for a storage battery case, as shown and described.

95,612
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application March 21, 1935, Serial No. 55,988
Term of patent 7 years



The ornamental design for a storage battery case, as shown and described.

95,613
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application April 3, 1935, Serial No. 56,188
Term of patent 7 years

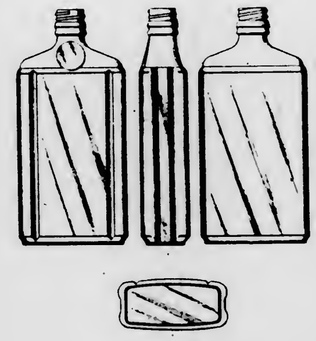


The ornamental design for a storage battery case, as shown and described.

95,614
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application April 3, 1935, Serial No. 56,189
Term of patent 7 years

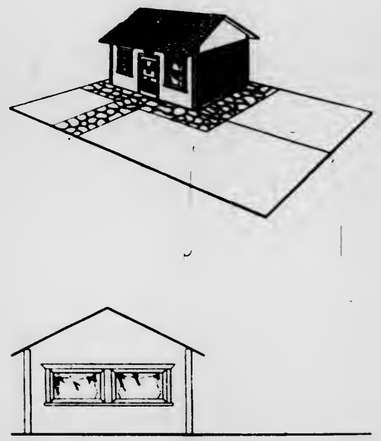
The ornamental design for a storage battery case, as shown and described.

95,615
DESIGN FOR A STORAGE BATTERY CASE
Oliver O. Rieser, Oak Park, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
Application April 3, 1935, Serial No. 56,190
Term of patent 7 years



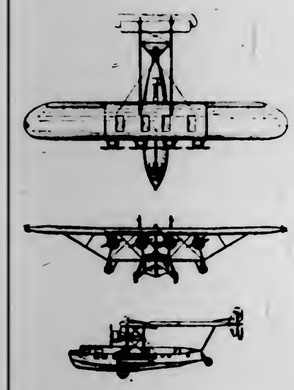
The ornamental design for a storage battery case, as shown and described.

95,616
DESIGN FOR A TAPE MEASURE
Herbert F. Ritter, Bogota, N. J.
Application January 15, 1935, Serial No. 54,864
Term of patent 7 years



The ornamental design for a tape measure, as shown.

95,617
DESIGN FOR A BOTTLE
George Sakier, New York, N. Y., assignor to Schenley Products Company, New York, N. Y., a corporation of New Jersey
Application March 6, 1935, Serial No. 55,756
Term of patent 14 years



The ornamental design for a bottle as shown.

95,618
DESIGN FOR A COMBINED FOLDING DOLL HOUSE AND YARD
Ellsworth E. Saxton, Seattle, Wash.
Application September 25, 1934, Serial No. 53,393
Term of patent 3½ years

The ornamental design for a combined folding doll house and yard, as shown and described.

95,619
DESIGN FOR AN AIRPLANE
Igor I. Sikorsky, Nichols, Conn., assignor to Sikorsky Aircraft Corporation, Stratford, Conn., a corporation of Delaware
Application August 19, 1933, Serial No. 49,066
Term of patent 3½ years

The ornamental design for an airplane, as shown.

95,620
DESIGN FOR A JAR
Frasier Smith, Wheeling, W. Va., assignor to Blue Plate Foods, Inc., New Orleans, La.
Application March 6, 1935, Serial No. 55,757
Term of patent 14 years

The ornamental design for a jar, as shown.

95,621
DESIGN FOR A KETTLE
Emil R. Zettler, Deerfield, Ill., assignor to Revere Copper and Brass Incorporated, Rome, N. Y., a corporation of Maryland
Application February 12, 1935, Serial No. 55,367
Term of patent 7 years

The ornamental design for a kettle, substantially as shown.

CARNEGIE LIBRARY OF ATLANTA

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 454—No. 3 TUESDAY, MAY 21, 1935 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.
PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.
CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Notices of Cancellation

U. S. Patent Office, *Washington, Apr. 18, 1935.*

Louis M. Furman, his assigns or legal representatives take notice:

An application for cancellation having been filed in this Office by The Manhattan Shirt Company, 444 Madison Avenue, New York, N. Y., to effect the cancellation of trade-mark registration of Louis M. Furman, 110 Bleeker Street, Brooklyn, N. Y., No. 156,799, dated July 11, 1922, and the notice of such proceeding sent by registered mail to the said Louis M. Furman at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Louis M. Furman, his assigns or legal representatives shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the Official Gazette for three consecutive weeks.

RICHARD SPENCER,
First Assistant Commissioner.

U. S. Patent Office, *Washington, Apr. 20, 1935.*

Morris Pober, his assigns or legal representatives take notice:

An application for cancellation having been filed in in this Office by Henry J. Edwards, 61 Hanover Street, Boston, Massachusetts, to effect the cancellation of trade-mark registration of Morris Pober, 16 West 18th Street, New York, N. Y., No. 317,523, dated September 25, 1934, and the notice of such proceeding sent by registered mail to the said Morris Pober at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Morris Pober, his assigns or legal representatives shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the Official Gazette for three consecutive weeks.

RICHARD SPENCER,
First Assistant Commissioner.

U. S. Patent Office, *Washington, May 8, 1935.*

W. Margulis, his assigns or legal representatives take notice:

An application for cancellation having been filed in this Office by Clover Leaf Products Co., 1848 East Vernon Avenue, Los Angeles, Calif., to effect the cancellation of trade-mark registration of W. Margulis, 671 Elo Street, Los Angeles, Calif., No. 317,803, dated October 2, 1934, and the notice of such proceeding sent by registered mail to the said W. Margulis at the said address having been returned by the post office undeliverable, notice is hereby given that unless said W. Margulis, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the Official Gazette for three consecutive weeks.

R. SPENCER.
First Assistant Commissioner.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed:

Pat. 1,818,390, C. W. Gordon, Boiler, decided April 12, 1935, claims 1, 4, 5, and 6.

Pat. 1,872,842, P. Storch and E. Rossberg, Call recording and charging system, decided May 1, 1935, claims 1 and 10.

Pat. 1,923,724, R. G. Griffith, Telegraph system, decided March 26, 1935, claim 1.

Pat. 1,960,837, M. J. Binkley, Rotary fuel burner, decided April 23, 1935, claim 10.
claim 1.

Pat. 1,963,178, A. F. Spiebler and C. R. Wagner, Process for treating hydrocarbon oils, decided May 1, 1935,

Adjudicated Patents

(C. C. A. Wis.) Goldberg patent, No. 1,732,808, for hairpin, claims 1 and 2. *Held* invalid because of anticipation. *Chain Store Products Corporation* v. *Scolding Locks Corporation*, 75 F.(2d) 818.

Condition of Applications Under Examination at Close of Business May 4, 1935

(Total number of applications awaiting action, excluding Trade-Mark Division, 34,310; Trade-Mark Division, 1,366. Oldest new case, January 5, 1935; oldest amended, January 4, 1935.)

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE WILSON

No. 3,572. Decided January 7, 1935

PATENTABILITY—PROCESS FOR PRODUCING ALUMINUM SULPHATE.

Claims for a process for producing aluminum sulphate *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. Joseph R. Mares for Wilson.

Mr. T. A. Hostetler and *Mr. Howard S. Miller* for the Commissioner of Patents.

GRAHAM, *P. J.:*

The appellant filed an application in the United States Patent Office for a patent on an alleged improved process of producing alum and silicious material from clay. Thirty-two claims were included in the application, all of which were rejected by the Examiner and Board of Appeals. The Examiner rejected the same on reference to the following patents: Pochin (British), 562 of 1856; Llewellyn (British), 112,881, January 31, 1918; Llewellyn (British), 119,924, October 24, 1918.

To these references, the Board added the following: Booze, 1,594,402, August 3, 1926; Ikeda et al., 1,630,660, May 31, 1927.

The appellant's process, as detailed in his specification, is practiced as follows: Wet clay is extruded from a press, through dies, to produce short cylinders, each approximately 3/32 of an inch in diameter and from 1/4 to 5/8 of an inch long. These forms of clay are dried and calcined, the calcining being done from 20 minutes to an hour, at a temperature from 650 degrees to 850 degrees, centigrade. In connection with this, the appellant stated in his specification: "It will be understood that the invention is not limited to any particular size and shape of clay bodies." Further, the appellant said:

• • • Hence in the appended claims by "bodies" is meant shapes or sizes no matter how formed from a mass of relatively smaller clay particles rendered plastic by the presence of water and whether uniform or not in respect to volume and geometric proportions.

These calcined cylinders are placed in an apparatus consisting of six tanks, each lined with a substance inert to sulphuric acid. Here, by means of a revolving tank of said acid, and a revolving tank of water, and certain connecting pipes, these cylinders are treated with sulphuric acid, by which means aluminum sulphate, or alum, is produced in the form of a clear liquor, without disintegration of the cylinders. The cylinder forms remaining constitute porous masses of chemically active silica, and may be used as a "surrogate," or substitute, for fuller's earth.

In practicing the process, the tanks and pipes are so arranged that the partially exhausted clay bodies are successively treated with fresh acid, and the fresh clay bodies are treated with the weak and partly exhausted acid.

The Board of Appeals was of opinion that claims 1, 23, and 24 were representative of all the claims. They seem to be so, and are here quoted. In addition, claims 5 and 8 are commented upon by appellant in his brief, and these are also quoted:

1. The process of producing aluminum sulphate from clay which comprises leaching calcined clay bodies with sulphuric acid to dissolve alumina while maintaining said bodies substantially undecrepitated whereby the aluminum sulphate liquor is substantially free from solid particles from said bodies.

5. The process of producing aluminum sulphate from clay which comprises dissolving alumina from calcined clay bodies with sulphuric acid not over from about 30 to 35% concentration.

8. The process of producing aluminum sulphate from clay which comprises calcining clay bodies at a temperature from 650 to 850 degrees C, leaching said bodies with sulphuric acid to dissolve alumina therefrom, and regulating the concentration of said acid to dissolve the alumina without substantial decrepitation of said bodies.

23. The process of producing aluminum sulphate from clay comprising forming the clay into bodies of material size, calcining the bodies to produce sulphuric acid soluble alumina therein with incipient fusion, and dissolving alumina from said bodies by treating them with dilute sulphuric acid, such treatment comprising utilization of a plurality of tanks or the like respectively containing the calcined clay bodies in batches of various degrees of exhaustion, passing water through said plurality of tanks in succession, the last tank of said series in respect to the flow of liquor containing fresh clay and the first tank and immediately succeeding tank containing the most exhausted clay; adding the acid to a plurality of tanks intermediate the two first tanks and the last tank of the series; and from time to time dumping the washed clay from the first tank of the series and refilling it with fresh clay, and then passing the water through said tanks to cause said refilled tank to be the last tank of the series in respect to the flow of liquor.

24. That process of producing porous material which comprises calcining clay bodies to incipient fusion and leaching out the alumina.

The gist of the appellant's alleged inventive process, as contended by him, is that he forms clay bodies of pulverulent clay, from which he can extract ammonium sulphate liquor; that the liquor is clear and uncharged with suspended material, and that the remainder can be utilized as a substitute for fuller's earth. Evidently there is no particular significance to the fact that the clay bodies are cylinder-shaped, nor is there any contention that this shape is critical, or aids in the process. Again, while claims 5 and 8, quoted, give certain percentages of acid, and certain degrees of heat used in the process, the specification does not denote, in any way, that these percentages are critical.

The Board of Appeals was of opinion that the references, especially the patents of Llewellyn, fully anticipated appellant's disclosure. Llewellyn, 112,881, discloses a process of preparing crude sulphate of ammonia solutions, in which crushed bauxite is calcined, placed in a suitable vessel, and treated with sulphuric acid. A system of vessels is arranged by which the most exhausted bauxite is treated with fresh acid, and the unexhausted material treated with the more exhausted acid, in the same manner as appellant's process is practiced. The portions of bauxite treated, are designated as "small pieces or lumps." A similar disclosure is made by Llewellyn in No. 119,924. Here, also, no change is made in the form of the pieces or particles used during the process.

It will be observed that the only apparent difference between the disclosure of these patents and the present application is that Llewellyn crushes his

raw material into pieces before burning, while the appellant builds his pieces up from pulverulent clay. The residue, after processing, is the same, except as to form, and is obviously adaptable for the same uses.

The patent to Pochin fully discloses the availability of this residuum, in these words appearing in his specification:

> • • • The mineral, prepared by the above method, can be employed with advantage in the manufacture of aluminous cake, pure sulphate of alumina, the alums of commerce, and other aluminous compounds, *whilst the silica afforded can be used for those purposes for which pure silica is required.* [Italics ours.]

We are advised by the record that the manner of making the clay body used by the appellant in his process is fully claimed in a copending application of the appellant in the Patent Office, No. 430,456, and no expression is desired to be made here as to the patentability of said process. So far as the formation of said clay bodies concerns the claims here involved, we are of opinion that the formation of such or similar bodies is fully shown by the additional references cited by the Board of Appeals, Booze and Ikeda et al.

As to claim 5, which specifies the degree of concentration of acid, the patents of Llewellyn both show that the concentration should be such as to prevent breaking down the clay bodies, and it does not appear that the particular degrees of concentration specified by the appellant are critical, or make any additional disclosure over Llewellyn's patents. The same is true as to claim 8, which specifies the range of temperatures used by the appellant.

The appellant argues that the patents to Ikeda et al. and Booze relate to non-analogous arts, and ought not to be used as references here. Without conceding the correctness of this position, it seems that even if such patents were not anticipatory, there appears to be no reason why the clay bodies of the appellant will operate any differently in the process than will the clay particles used by Llewellyn in his patents. If the shape or size of the appellant's clay bodies is important or critical, the same is not shown by his application, or claimed in the argument of counsel.

We, therefore, are of opinion that the decision of the Board of Appeals is without error, and it is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

WALGREEN CO. *v.* GODEFROY MANUFACTURING CO.

No. 3,357. Decided December 24, 1934

1. TRADE-MARKS—DESCRIPTIVENESS—FOREIGN WORDS.
   "It is true that the English meaning of appellee's trade-mark might be unknown to many. Nevertheless, it is well settled that foreign words and phrases, merely descriptive of the character or quality of the goods on which they are used, are not registrable under the Trade-Mark Act of February 20, 1905."
2. SAME—SAME—"PEAUDOUCE" FOR SKIN CREAMS.
   The term "Peaudouce" which means "soft skin" *Held* descriptive as applied to a "skin cream" and therefore not registrable and that the registration which had been obtained therefor should be cancelled.

APPEAL from the Patent Office. Reversed.

Mr. Harry C. Alberts for Walgreen Co.

Messrs. Carr & Carr & Gravely and *Mr. Joseph H. Gravely* for Godefroy Manufacturing Co.

HATFIELD, *J.*:

This is an appeal in a trade-mark cancellation proceeding from the decision of the Commissioner of Patents reversing the decision of the Examiner of Interferences sustaining the application of appellant for the cancellation of appellee's trade-mark registration No. 250,012, of the word "Peaudouce," issued November 27, 1928, for use on "Skin Cream".

It is claimed by appellant in its application for cancellation that appellee's trade-mark "Peaudouce" consists in the combination of the French words "peau" and "douce"—the word "peau" meaning skin, and the word "douce" meaning soft; that, therefore, appellee's registered trade-mark is merely descriptive of the character and quality of appellee's skin cream; that, at the time of the filing of its application for cancellation, and prior thereto, appellant was using the trade-mark "Peau-Doux" on talc, face powder, shaving cream, and "after shaving lotion for skin application and treatment"; that its trade-mark "Peau-Doux," although of masculine gender, also means "soft skin," and is descriptive of the "usefulness and potency of appellant's goods"; that appellee was not, on the date of its application for registration—June 30, 1928, entitled to the exclusive use of its trade-mark "Peaudouce"; that appellant is entitled to use the term "Peau-Doux" to describe the character and quality of its goods; and that appellant deems itself injured by appellee's trade-mark registration.

In its answer, appellee admits that the French word "peau" means skin, but denies that the French word "douce" means soft and that its trade-mark "Peaudouce" is merely descriptive of appellee's goods. It alleges that its registration is valid, and that it is the owner and is entitled to the exclusive use of its trade-mark for skin creams, and goods possessing the same descriptive properties.

The parties entered into a stipulation, whereby it was agreed that the evidence in Opposition No. 9373, *Walgreen Co.* v. *Godefroy Mfg. Co.*, 19 C. C. P. A. (Patents) 1150, 58 F.(2d) 457, involving the same trade-marks, should be considered as a part of the record in the case at bar.

In that proceeding, the opposer, the Godefroy Manufacturing Company, alone took testimony.

It there appeared that appellant, Walgreen Co., sought to register a composite trade-mark consisting of the head and shoulders of a man in profile, together with the French words "Peau-Doux," and the notation "(Po-Do)" to indicate the correct pronunciation of "Peau-Doux," for use on shaving cream, under the Trade-Mark Act of February 20, 1905. In its notice of opposition, the Godefroy Manufacturing Company relied upon its registration No. 250,012, involved in the case at bar.

It was there claimed by appellant, Walgreen Company, that the Godefroy Manufacturing Company's trade-mark "Peaudouce" was descriptive; that it was not the subject of exclusive ownership; and that, therefore, the notice of opposition should be dismissed.

This court there held, however, as in many previous decisions on the subject, that the validity of an opposer's registered mark would not be considered in an opposition proceeding, and, in affirming the decision of the Commissioner of Patents holding that the Walgreen Company was not entitled to register its trade-mark, stated that the Godefroy Manufacturing Company had used its trade-mark "Peaudouce" on skin cream long prior to any use by the Walgreen Company of its trade-mark; that the goods of the parties possessed the same descriptive properties; and that the marks were confusingly similar.

In the case at bar, the Godefroy Manufacturing Company, appellee, is relying upon the evidence submitted by it in the opposition proceeding.

Appellant, Walgreen Company, has introduced some evidence, but, due to the views we hold, we deem it unnecessary to state the purport of it.

The Examiner of Interferences held that appellee's registered mark "Peaudouce" meant "soft skin," and was descriptive of the character and quality of appellee's skin cream, and, accordingly, sustained the application for cancellation.

On appeal, the Commissioner of Patents held that the French word "douce" translated into English not only meant "soft," but also "sweet, fragrant, odoriferous, • • • mild, agreeable, calm, tranquil, smooth, easy, gentle, affable, complaisant, tractable, pliant according to the subject in connection with which the word is used"; that, although the mark "Peaudouce" could be interpreted to mean soft skin, it also meant smooth or pliant skin; and that, due to the possible variations in the meaning of the French word "douce," especially in view of the long continued use by appellee of its trade-mark, doubt of the descriptiveness of the mark should be resolved in favor of appellee, and, accordingly, held that appellee's registration should not be cancelled, and that appellant's application for cancellation should be dismissed.

It is not contended here by counsel for appellant that appellee had abandoned its trade-mark, or was not using it at the time of the filing of appellant's application for cancellation. Furthermore, the holding by this court in the opposition proceeding is *res adjudicata* as to the question of priority of use. Accordingly, the sole issue presented to this court in the case at bar is whether appellee's registered trade-mark "Peaudouce" comes within the statutory inhibition of the registration of marks merely descriptive of the character or quality of the goods on which used.

It is contended by counsel for appellant that appellee's mark was formed by combining the two French words "peau," meaning skin, and "douce," meaning soft; and that it is used to describe the quality and character of appellee's skin cream.

It is contended by counsel for appellee, on the contrary, that appellee's registration is valid; that its mark is not merely descriptive; that "the only real question in the case concerns appellant's contention that appellee's mark is descriptive"; that there is a clear legal distinction "between marks which describe the goods themselves and marks which are indicative of results following the use of the goods." In explanation of that contention, counsel cited the cases of *Winchester Repeating Arms Company* v. *Peters Cartridge Co.*, 30 App. D. C. 505, where it was held that the term "self-loading" was descriptive as applied to cartridges, and *Montgomery Ward & Co. (Inc.)* v. *Sears, Roebuck Co.*, 18 C. C. P. A. (Patents) 1386, 49 F.(2d) 842, wherein, so counsel for appellee contend, this court held that the trade-mark "Sta-clean [Sta-Klean]" was a valid trade-mark for ammunition.

We may say at the outset that the question of whether the marks there involved were descriptive was not raised in the *Montgomery Ward & Co. (Inc.)* v. *Sears, Roebuck Co.*, case, supra. The sole issue there before the court involved the question of the priority of use.

In the case of *Florence Mfg. Co.* v. *J. C. Dowd & Co.*, 178 Fed. Rep. 73, the Circuit Court of Appeals, Second Circuit, in a case involving unfair competition, held that the trade-marks "Keepclean" and "Sta-Kleen," as applied to tooth-brushes, were merely descriptive, and, therefore, not valid technical trade-marks.

It is conceded by counsel for appellee that the French word "peau" means skin. It is claimed, however, that the French word "douce" primarily means "sweet, pleasant, or agreeable to the senses," and that "soft" is a secondary or forced meaning. Counsel cites no authority in support of that contention, which, as a matter of fact, is directly contrary to the testimony of the witness Charles Webb Godefroy, president and manager of the appellee company, who stated that appellee's trade-mark "Peaudouce" means "soft skin"—the word "peau" meaning skin, and the word "douce" meaning soft; and that appellee's skin cream was used especially as a "skin softener and healer."

Although appellee has used its trade-mark for many years, there is nothing of record to establish that it has acquired a secondary meaning.

[1] It is true that the English meaning of appellee's trade-mark might be unknown to many. Nevertheless, it is well settled that foreign words and phrases, merely descriptive of the character or quality of the goods on which they are used, are not registerable under the Trade-Mark Act of February 20, 1905. *In re Bradford Dyeing Association*, 46 App. D. C. 512.

[2] In view of the facts of record, we are of opinion that the trade-mark "Peaudouce" is merely descriptive of the intended purpose and function of the goods on which it is used, and is, therefore, merely descriptive of the "qualities, ingredients, or characteristics" of such goods; that, when so used, it is not subject to exclusive trade-mark appropriation; and that appellee's registration No. 250,012 is invalid and should be cancelled. *Beckwith, Inc.*,

v. *Commissioner of Patents*, 252 U. S. 538; *Rumford Chemical Works* v. *Muth et al.*, 35 Fed. 524; *Winchester Repeating Arms Company* v. *Peters Cartridge Co.*, supra; *Ball* v. *Siegel*, 116 Ill. 137, 4 N. E. 667; *Sears Roebuck & Co.* v. *Elliott Varnish Co.*, 232 Fed. 388; *NO-D-KA Dentifrice Co.* v. *S. S. Kresge Co.*, 24 F.(2d) 726; *In re Berger*, 56 App. D. C. 250, 12 F.(2d) 191.

For the reasons herein stated, the decision of the Commissioner of Patents is reversed.

Reversed.

U. S. Court of Customs and Patent Appeals

QUAKER OIL COMPANY, INC., *v.* QUAKER STATE OIL REFINING COMPANY

Nos. 3,367, 3,368, and 3,369. Decided January 7, 1935

1. OPPOSITION—EVIDENCE—PRIOR ADOPTION AND USE.

Record reviewed and *Held* insufficient to establish that appellant had used a trade-mark, the predominant feature of which is the word "Quaker", on lubricating oils prior to the adoption by appellee's predecessor of the trade-mark "Quaker State" for the same goods.

2. SAME—SAME—REOPENING.

Where the Commissioner of Patents, on motion of appellant, reopened the proceedings, *Held* that the record shows that the case was reopened solely to permit appellant to introduce the evidence specified in its motion and in the affidavits accompanying it, and that all testimony thereafter introduced by the appellant, except the exhibits attached to the affidavits filed in support of the motion and the testimony relating thereto, was properly stricken from the record.

APPEAL from the Patent Office. Affirmed.

Messrs. Chindahl, Parker & Carlson, *Mr. George E. Tew* and *Mr. Lincoln B. Smith* for Quaker Oil Company, Inc.

Messrs. Mason, Fenwick & Lawrence, *Messrs. Frampton & Courtney* and *Mr. Edward C. Fenwick* and *Mr. J. V. Frampton* for Quaker State Oil Refining Company.

HATFIELD, *J.*:

These are appeals in trade-mark opposition and cancellation proceedings from the decisions of the Commissioner of Patents affirming the decisions of the Examiner of Interferences sustaining appellee's notices of opposition, Nos. 9,222 and 9,223, Appeals Nos. 3,367 and 3,368, and also appellee's application for cancellation, No. 1,955, Appeal No. 3,369, of appellant's Registration No. 248,607.

In the opposition proceedings it was held that appellant was not entitled to the registration of the trade-mark "Qunker" "A" for use on lubricating oils and greases, nor to the registration of a composite trade-mark, the dominant feature of which is the word "Quaker," for use on lubricating oils, gasoline, and kerosene, applications for which were filed July 3, 1928, and June 27, 1928, respectively.

In the cancellation proceeding it was held that appellant was not the owner of the trade-mark "Quaker Premium" for use on motor lubricating oils and similar products, and that its Registration No. 248,607, issued October 23, 1928, on an application filed June 13, 1928, should be cancelled.

It appears from the record that the three causes were submitted to the Patent Office tribunals on a single record, and that the issues raised in the several proceedings were disposed of by those tribunals by decisions in opposition proceeding No. 9,222, Appeal No. 3,367.

A stipulation, subject to, and which has met with, our approval, was entered into by counsel for the parties. It was agreed therein that our decision in Opposition No. 9,222, Appeal No. 3,367,

shall govern the disposition of the appeals in the companion cases, Opposition No. 9,223 [Appeal No. 3,368] and Cancellation No. 1,955 [Appeal No. 3,369], all three of such cases having been tried and disposed of on the same record in the Patent Office.

Appellant in its application for registration in Opposition No. 9,222, Appeal No. 3,367, stated that it had used its trade-mark "Quaker" "A" on motor lubricating oil since January, 1916.

Dates of adoption and use subsequent to January 1916, were alleged in appellant's applications in the other involved cases.

Appellee's trade-marks "Quaker State Medium," with the monogram "QSM," and "Quaker State" are used on lubricating oils and greases.

It appears from the record that appellee's trade-marks have been in continuous use by appellee and its predecessor since July 31, 1914; that they were registered in the United States Patent Office as follows: "Quaker State Medium," with the monogram "QSM," September 14, 1915, Registration No. 106,015; "Quaker State" August 16, 1921, Registration No. 145,778; that appellee's lubricating oils and greases are generally referred to by the term "Quaker"; that appellee has utilized practically every available means in advertising its trade-marks and its lubricating motor oils throughout the United States and Canada, including such advertising agencies as the Saturday Evening Post, Literary Digest, Collier's, American, and Country Gentleman, Power Farming Dealer, the radio, newspapers, road and sidewalk signs, electrical billboard displays, circular letters, etc.; that it has expended more than $2,000,000 in such advertising; and that it has sold its lubricating motor oils under its trade-marks throughout the United States and Canada.

Subsequent to the introduction of evidence by appellee establishing the facts hereinbefore set forth, appellant, a corporation of Plainfield, Indiana, introduced evidence to the effect that one G. F. Calbert, about the year 1902 or 1903, was engaged in the business of selling roof paint under the name of the Quaker Roof Paint Company; that in 1906 the company extended its business to include house paint, and the name was changed to Quaker Roof and House Paint Company; that about the year 1911 the business was extended to include lubricating oils, and the name of the company was changed to the Quaker Oil Company; and that in 1917 the company was incorporated under the name Quaker Oil Company, Inc.

Although at the time the cause was originally submitted to the Examiner of Interferences appellant introduced some oral testimony for the purpose of establishing that it and its predecessors had used trade-marks with the word "Quaker" appearing as the dominant feature of each on lubricating oils during the latter part of the year 1911 or the early part of 1912, and continuously thereafter, no documentary evidence was submitted tending to establish such use prior to the year 1916.

The witness Frank M. Calbert, secretary and treasurer of the appellant company, whose testimony was given in 1930, testified that he kept all of the records for appellant's predecessor during the latter part of the year 1911 and for several years thereafter, and did all the "invoicing of bills" for lubricating motor oil "until the past few years." He further stated that his company sold inferior grades of lubricating oils on which its trade-marks were not used.

The Examiner of Interferences, in his original decision, March 26, 1931, held that appellant was not entitled to register its trade-mark "Quaker," "A" and with reference to the testimony of the witness Frank M. Calbert, among other things, said:

This witness was then asked on further cross-examination to point out which of the records in evidence show the word Quaker in connection with oil. This he was unable to do; and finally admitted that neither the records nor the invoices, exhibit 4, show the word Quaker in connection with oil * * *. This testimony is significant because, as pointed out, the name Quaker does appear on these invoices and other records in connection with applicant's other products, such as paint and roofing materials, which are goods not here in controversy.

There is a further circumstance in this case which cannot be overlooked, *namely, that this same witness, F. M. Calbert, executed the present application on behalf of the respondent for the mark here in issue. As previously noted, in this application the first date of use alleged is January 1916. Not a word of explanation appears in the record as to the reason why that date and not the one now claimed was alleged in the application.*

As hereinbefore pointed out, the duty of going forward with evidence that is clear and convincing to establish a date of use prior to that alleged in the application, namely, January, 1916, is upon the respondent. The testimony relied upon by the respondent to establish an earlier date is wholly oral and its probative force must be measured by the surrounding circumstances as well as its innate character as analyzed above. [Italics ours.]

Thereafter, on April 11, 1931, appellant filed a written request for an extension of time, from April 15 to April 25, 1931, in which it might appeal to the Commissioner of Patents, because, it was stated, it was "considering bringing a motion to reopen" the case. On April 14, 1931, the request was granted. On April 17, 1931, appellant filed a motion requesting that the case be reopened to permit it to introduce "newly discovered evidence."

We quote from the motion:

Now comes Quaker Oil Company, Incorporated, by its counsel, and moves to reopen the above-entitled cases in order that newly discovered evidence may be taken of trade-mark use of the word Quaker on oil prior to 1914 *namely order slips, bills of sale, and a shipping memorandum, as set forth in the accompanying affidavit of Frank M. Calbert, which evidence has been discovered since the depositions have been closed.*

The admission of *this* newly discovered evidence is necessary to a proper and just determination of these causes. [Italics ours.]

Accompanying the motion were two affidavits; one by Thomas L. Mead, Jr., and one by Frank M. Calbert, which, due to their importance, we set forth:

* * * that * * * Thomas L. Mead, Jr. * * * on April 15, 1930 in Plainfield, Indiana, examined the witness produced by the Quaker Oil Company, Incorporated, in the above-entitled causes. That on April 14 he searched diligently among the sales slips of the Quaker Oil Company, the predecessor of Quaker Oil Company, Incorporated, for the years 1912, 1913, and 1914, which sales slips were tied in bundles and stored in pasteboard boxes in the shipping room of said Quaker Oil Company, Incorporated. That said bundles were supposed to contain all the sales slips for the years stated. That several hours were so spent in searching with the result shown by the sales-slip exhibits introduced in evidence. *That the sales slip attached to the accompanying affidavit of Frank M. Calbert were not found.* [Italics ours.]

AFFIDAVIT OF FRANK M. CALBERT

Frank M. Calbert, being duly sworn upon his oath says that he is the Secretary-Treasurer of the Quaker Oil Company, Incorporated, with its principal office located at Plainfield, Indiana, which company is involved in the above numbered causes pending before the United States Patent Office in Washington, D. C.

Affiant further says that since the final hearing of February 11, 1931, and within the last 10 days he has discovered further evidence, and that he has discovered new evidence sustaining the contention of the Quaker Oil Company, Incorporated, as to its application for trade marks and in support of the contention of the Quaker Oil Company, Incorporated, that the application for cancellation by the Quaker State Oil Refining Company should be denied.

Affiant further says that during the course of business of the Quaker Oil Company, and prior to its incorporation, kept its files and papers but that some of them were deposited in the attic of an old barn and others were left in a safe in a storage room, other than said barn. That at the time affiant made the first search for evidence and the files of the Quaker Oil Company said old safe was covered up with asbestos fibre and it was this affiant's belief that all of the files had been removed long since from said old safe. That since February 11, 1931, some of the asbestos fibre was used in and about said safe and said *safe was uncovered and opened and it was found that there was deposited in said safe some of the files of the Quaker Oil Company of Plainfield, Indiana. Upon examination of said files there was discovered that there were certain invoices showing sales of the Quaker Oil Company in 1913 in which the trade mark "Quaker A" and the trade mark "Quaker BB" were both used in the invoices and affiant says that those invoices are true and genuine and state the truth.* That the same have not in any wise been changed or tampered with, but that the words "Quaker A" and "Quaker BB" were on said invoices at the time as shown by the date of said invoices.

Affiant further says that in compiling and securing the evidence during the trial of this cause and before the final hearing that he used due diligence to discover all of the files and that he spent many days in going through old papers, but that the papers in the old safe, above referred to, were overlooked by reason of the fact that this affiant and his associates were quite positive, at the time, that all of said files had been removed from said old safe.

Affiant further says that the invoices and other exhibits attached to this affidavit are all genuine and true and are attached hereto for the sole purpose of aiding and assisting the Patent Office and its officials to arrive at the truth concerning the matters involved in the above causes. Affiant further says that the use of the year 1916 in the application filed by the Quaker Oil Company, Incorporated, was inserted by inadvertence and mistake and is not the truth and *that these exhibits disclose the real truth of the date as being prior to 1914 when said Quaker Oil Company, Incorporated, and its predecessor, used trade marks of "Quaker A" "Quaker BB".*

Affiant further says that *there is also attached hereto an order dated June 26, 1913, from Chester R. Downey and a bill of lading on which said order was shipped and that said order and said bill of lading are genuine and that they are competent evidence in this issue and were only discovered by this affiant within the last 10 days. That said exhibits were found in the safe above referred to.*

Wherefore, this affiant, in behalf of the Quaker Oil Company, Incorporated, prays the United States Patent Office *to stay further proceedings in the above causes pending and affecting the Quaker Oil Company, Incorporated, until these exhibits may be made a part of the evidence in said causes* and that said Quaker Oil Company, Incorporated, at Plainfield, Indiana, be granted all proper relief upon a showing made by this affidavit and the exhibits attached hereto. [Italics ours.]

Attached to the affidavit of Frank M. Calbert were exhibits 2, 14, 15, 27 to 31, inclusive, and 33 to 38, inclusive.

In a decision dated May 27, 1931, appellant's motion to reopen was denied by the Examiner of Interferences.

On June 11, 1931, an appeal was taken by appellant to the Commissioner of Patents, wherein it was stated that the Examiner of Interferences erred—

In refusing to reopen these cases to admit newly discovered documentary evidence corroborative of the oral testimony of respondent's witnesses, and the absence of which documentary evidence forms the basis for the adverse decision appealed from.

In his decision, October 5, 1931, the Commissioner of Patents, although approving the conclusion

reached by the Examiner of Interferences on the evidence as originally submitted, reversed his decision denying the motion of appellant to reopen the case, and, with reference thereto, said:

> The magnitude of the interests involved in this proceeding; the explanation of the conditions under which *the newly discovered evidence* was finally found, as well as *the nature of that evidence*, suggest the propriety of having the complete record presented to this Office before the final adjudication of the matters in issue. [Italics ours.]

On October 13, 1931, the Examiner of Interferences reset the times for the introduction of evidence in chief by appellant, and evidence in rebuttal by appellee.

Appellant introduced in evidence the exhibits attached to the affidavit of Frank M. Calbert, filed in support of the motion to reopen the case, and, in addition thereto, other oral and documentary evidence.

With the exception of Exhibit R, which is not material here, no further evidence was introduced by appellee.

On November 25, 1932, the Examiner of Interferences sustained the motion of appellee, filed March 25, 1932, to strike from the record all of the evidence introduced by appellant subsequent to the reopening of the case, except the exhibits attached to the affidavit filed in support of the motion to reopen and the testimony relative thereto.

In that part of his decision relating to appellee's motion to strike, the Examiner of Interferences, among other things, said:

> In the decision of the Examiner, from which appeal was taken to the Commissioner, attention was called to the practice with respect to reopening as covered by Federal Equity Rule 69 and Patent Office Rule 154d, and certain decisions were cited in support thereof. *In his brief before the Commissioner, on appeal, applicant has differentiated the instant case from those decisions in the following language:*
>
> "In the case of *McLeod et al. v. City of New Albany*, it was held that a case could not be reopened *if the facts sought to be proven were not set forth. The evidence here sought to be introduced is before Your Honor*".
>
> It is clear therefore that all the evidence said to be newly discovered was then specifically identified by the record which was before the Commissioner when the latter rendered his decision to reopen the case to admit this evidence.
>
> This decision therefore is interpreted by the Examiner as authorizing the taking of the testimony only of those persons who can testify relative to these documentary exhibits, to wit: Frank M. Calbert, Wolf, Shrock, Green, and Swift. [Italics ours.]

After carefully and fully analyzing such of this additional evidence, as he held to be a proper part of the record, the Examiner of Interferences concluded that it was wholly insufficient to establish use by appellant of a trade-mark, the dominant feature of which was the word "Quaker," on, or prior to, July 31, 1914, the date of the adoption and use by appellee's predecessor of appellee's trade-marks.

On appeal, the Commissioner of Patents affirmed the decision of the Examiner of Interferences, and with reference to the granting of appellant's motion to reopen, among other things, said:

> The granting of the motion to reopen was solely for the purpose of presenting the evidence accompanying and forming the basis for the motion and such testimony of witnesses as was necessary to prove the exhibits included. Not only had the applicant failed to obtain permission to take any additional testimony but no request therefor had even been filed.

With regard to the additional evidence, held to be properly introduced by appellant, the Commissioner said, *inter alia:*

> The difficulty with it all is that even granting the exhibits are genuine they fail when taken in connection with the testimony regarding them to show trade-mark use on the goods. No witness testifies that the goods referred to in any of these exhibits *bore the trade-mark* for which applicant seeks registration. The witnesses were testifying as to what is alleged to have occurred some eighteen or more years previous. They state almost nothing about *these exhibits*. These papers do not show the trade-mark was on the goods sold. Sifting through this new evidence and what the witnesses state about the exhibits there is nothing upon which to base a holding that goods *bearing the trade-mark* in question were actually sold prior to July 31, 1914, when the opposer began using its mark.

[1] We have carefully reviewed all of the evidence considered by the Patent Office tribunals, and are in entire accord with the conclusion reached by them. That evidence, discussed in detail and carefully analyzed in the decision of the Examiner of Interferences, and somewhat more generally in the decision of the Commissioner of Patents, is, in our opinion, wholly insufficient to establish the use by appellant of a trade-mark, the dominant feature of which was the word "Quaker," on lubricating oil, or goods of the same descriptive properties, prior to the adoption and use by appellee's predecessor of the trade-mark "Quaker State"—July 31, 1914.

We come now to a consideration of the question whether the Commissioner of Patents erred in affirming the decision of the Examiner of Interferences sustaining appellee's motion to strike from the record the evidence introduced by appellant subsequent to the reopening of the case, except the exhibits attached to the affidavit accompanying the motion to reopen and the testimony relative thereto.

It is contended by counsel for appellant that the Commissioner did not impose any limitations as to the evidence which appellant might introduce, and that, therefore, the granting of appellant's motion to reopen the case for the purpose of the introduction of newly discovered evidence was equivalent to the granting of a petition for rehearing in equity cases, or to the granting of a motion for a new trial in cases at law; that appellant was entitled to take any and all available evidence for the purpose of establishing that it had used its trade-marks on lubricating oils prior to July 31, 1914; and that the Commissioner of Patents erred in affirming the decision of the Examiner of Interferences sustaining appellee's motion to strike such additional evidence from the record as was not referred to in the motion to reopen, and in his refusal to consider such evidence.

We deem it unnecessary to enter upon a discussion of the rights and responsibilities generally of a party whose petition for a rehearing, or for a new trial, as the case might be, has been granted.

[2] In the case at bar, subsequent to an adverse decision by the Examiner of Interferences, appellant merely petitioned for a reopening of the case in order that it might introduce certain specified newly discovered documentary evidence.

It is true that the language used by the Commissioner of Patents in his decision reversing the decision of the Examiner of Interferences and granting the motion to reopen the case is somewhat general, nevertheless, it definitely refers to "the newly discovered evidence" upon which the motion to reopen was based, and we think it was his evident purpose, as stated by him in the decision from which this appeal was taken, to reopen the case solely to permit appellant to introduce the evidence specified in its motion and in the affidavit accompanying it. If the Commissioner had intended reopening the case for any purpose other than that requested in appellant's motion and affidavit, we would expect to find language definitely expressive of such intent.

Appellant's motion to reopen was addressed to the sound discretion of the tribunals of the Patent Office. That discretion was exercised on behalf of appellant, and the motion was granted. Then, without any notice whatsoever to the Examiner of Interferences, appellant proceeded to take evidence in addition to that referred to in the motion to reopen. No showing was ever made that such evidence was "newly discovered," within the well settled meaning of that term. (See 21 C. J. Sec. 881; 46 C. J. Secs. 536, 547.) So, it appears, appellant not only had *full opportunity* to introduce all the evidence it desired on the original trial, but it was also afforded *full opportunity* to present all the evidence requested in its motion to reopen. We think it is evident, therefore, that, having a proper regard for an orderly course of procedure and the observance and enforcement of settled rules pertaining thereto, the discretionary authority of the tribunals of the Patent Office, in respect to matters of this character was properly exercised in the case at bar, and that those tribunals were fully justified in sustaining appellee's motion to strike from the record all evidence, except the exhibits attached to the affidavit filed in support of the motion to reopen and the testimony relating thereto, introduced by appellant subsequent to the reopening of the case, and in refusing to consider such evidence. (See 64 C. J. Sec. 185.)

For the reasons stated, the decision of the Commissioner of Patents, in each of the involved appeals, is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE WILLIEN AND STEIN

No. 3,856. Decided January 28, 1935

[71 F.(2d) 550]

PATENTABILITY—PROCESS OF MAKING CARBURETED WATER GAS.

A claim for a process of making carbureted water gas *Held* patentable over the prior art.

Appeal from the Patent Office. Modified.

Mr. Augustus B. Stoughton and *Mr. E. S. W. Farnum, Jr.* for Willien and Stein.

Mr. T. A. Hostetler and *Mr. Howard S. Miller* for the Commissioner of Patents.

HATFIELD, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting all of the claims, Nos. 9 and 10, in appellants' application for a patent for an alleged invention relating to a process for manufacturing carbureted water gas of low specific gravity.

At the time of the oral arguments in this court, appellants moved to dismiss the appeal as to claim 10.

Claim 9 reads:

> 9. The process of making carbureted water gas of low specific gravity which, when practiced in a set including a single generator, a single carbureter, a single superheater, in individual detached shells, and a wash box, connected in series, comprises internally preheating the carbureter and superheater solely by air blast gas from the generator, making carbureted water gas by forward steaming and carbureting, *introducing hydrocarbon oil into the back run steam, and generating gas comprising carbureted water gas and hydrogen and of lower specific gravity than the forward run carbureted water gas and of lower specific gravity than would be the case in the absence of the introduction of the hydrocarbon oil by passing the mixture of steam and oil down through the fuel bed partially decomposing the hydrocarbon oil to hydrogen and to oil gas which latter carburets the water gas simultaneously generated in the fuel bed.* [Italics ours.]

The references are: Young, 1,519,523, December 16, 1924; Young, 1,751,849, March 25, 1930; Whitwell, 1,752,223, March 25, 1930.

Appellants' application, Serial No. 297,243, filed August 3, 1928, is a continuation of their application, Serial No. 187,876, filed April 30, 1927.

In their specification, appellants state—

> Our invention involves an improvement in the process of making carbureted water gas in a three-shell set including a generator, carburetor and superheater, which comprises a blasting cycle to heat the fuel bed to incandescence and store heat in the carburetor and superheater, one combustible gas-making cycle wherein steam is passed through the fuel bed of the generator and the resultant gas passed into and through the carburetor where it is enriched with oil, the enriched gas being passed into and through the superheater and wash box and the usual purifying and gas treating devices into a holder, and a second combustible gas generating cycle commonly known as the back-run cycle, consisting in introducing steam at any convenient point into the set, preferably into the superheater, and then passing the steam through the set into the generator and through the fuel bed therein, the resultant gas being passed into the wash box and thence into and through the purifying and gas treating devices and usually admixed with the combustible gas made in a previous cycle. According to such processes, carburetted water gas of a B. t. u. value equal to the mean B. t. u. value of the gas obtained from both combustible gas generating cycles of operation is produced and a substantially constant volume of gas is generated by the gas-making set.
>
> According to the present invention, oil is added to the steam passing through the superheater and carburetor prior to passage thereof through the fuel bed in the generator, the resultant mixture being passed through the fuel bed and the resultant gas passed directly from the generator to the wash box. Preferably, the oil is introduced into the superheater simultaneously with the introduction of steam thereinto. By the practice of our process carburetted water gas of a greater B. t. u. value, low gravity gas and a greater yield of gas is obtained.
>
> In the operation of water gas sets there are frequent temporary demands for increased gas and heretofore, to accommodate such demands, it has been necessary to provide a spare installation for the generation of the increased gas to meet such temporary demands or peak loads. According to our invention, carburetted water gas sets are operated as is customary to meet the normal demands but when it is necessary to generate more gas to accommodate increased or peak demands an enriching constituent such as oil, as hereinbefore pointed out, is added to the gas-making steam of the back run cycle, preferably introduced into the superheater and the mixture of steam and oil is passed into and through the fuel bed in the generator down through the fuel bed so that more gas and/or gas of higher B. t. u. value is produced. It will be noted that according to our invention it is possible to meet the incidental and irregular or temporary demands for increased gas without having a spare installation, or without having a gas set with a greater capacity than that required for normal operation.

In his decision, the Primary Examiner stated that the appealed claim was fully met by the patents to Young, No. 1,751,849, and Whitwell. With reference to the latter patent, the Examiner said:

> Whitwell 1,752,223 discloses the first two steps of applicants' process, these being conventional as stated supra,

and further acknowledged to be old by applicants on page 5 of the specification as amended. In addition, Whitwell discloses step (3), in that he injects a fluid hydrocarbon such as natural gas, with his back run steam *at the top of the superheater*. Note page 4, lines 12–50. In lines 41–44 "other gas" is defined as including also *vapors*. The oil injected by applicants must be vaporized before it is subjected to the cracking temperatures in the fuel bed.

It appears from the record that the patent to Young, No. 1,751,849, was issued March 25, 1930, on an application filed June 22, 1922.

On October 10, 1929, the patentee Young inserted the following, by amendment, in his original application:

While I have described carbureting with oil during the forward run, the oil being admitted through nozzle 22, and the carbureting with the volatiles from bituminous coal admitted at 90 during the back run, it is evident that oil might be admitted at 22 during a back run or that other carbureting material than oil might be admitted at 22 during either a forward or a back run. Here again the flexibility of the process is one of its important merits.

Appellants submitted an affidavit under rule 75 of the Rules of Practice in the United States Patent Office, in which it was established that they completed the invention prior to the amendment made by Young to his specification.

In view of the fact that the patentee had not, prior to his amendment, disclosed specifically the introduction of hydrocarbon oil during the back-run cycle, appellants contended that the patent to Young, No. 1,751,849, was not a proper reference.

However, the Primary Examiner did not adopt that view, but, on the contrary, held that the amendment was based on "matter originally disclosed and claimed" by Young.

On appeal, the only reference referred to by the Board of Appeals was the patent to Young, No. 1,751,849. With regard thereto, the board said:

The patent to Young, 1,751,849, discloses this modification except that in the application as originally filed the back flow of steam mingled with finely divided material which apparently was coal. An amendment was introduced into the Young application stating that oil could be employed instead of coal. Appellants filed an affidavit under rule 75 which the Examiner has accepted as showing a completion of the invention covered by claim 9 prior to the date of the amendment in the Young application. The Examiner, however, has held that the reference to oil in the amendment is not new matter but is supported by the Young disclosure as originally filed. He calls attention to the fact that original claim 1 was generic to a hydrocarbon which might be either oil or coal and that oil was mentioned on page 3 of the original specification.

The use of a generic term in the original claim does not specifically disclose the use of oil. The reference to oil on page 3 contains no suggestion that the oil which enters through the pipe 21 would be mingled with the back flow steam. We have also investigated the other matters referred to by the Examiner in support of his holding that the amendment did not involve new matter but in our opinion there is no disclosure in the Young application as originally filed that oil will be mingled with the back flow steam. However, as shown by the original claim 1 above referred to, Young regarded his invention as generic to hydrocarbons such as coal and oil and we consider that it would readily occur to one skilled in the art to substitute an oil spray for the coal dispensing means.

* * * * * *

For the reason above stated, the decision of the Examiner is affirmed in holding the subject matter of the appealed claims to be unpatentable over the prior art.

We deem it unnecessary to discuss the references of record, further than to say that, although they disclose that it was old in the art to introduce hydrocarbon oil in the *forward-run cycle* for the purpose of enriching the gas, the patent to Young, No. 1,751,849, as amended, is the only reference which discloses the gist of appellants' invention—the introduction of hydrocarbon oil in the *back-run cycle*.

The Board of Appeals held that the patentee's application, prior to the amendment of October 10, 1929, did not disclose that feature. The Board concluded, however, that the patentee Young "regarded his invention as generic to hydrocarbons such as coal and oil," and that, therefore, it would not involve invention to "substitute an oil spray for the" patentee's "coal dispensing means." Accordingly, the sole issue in the case is whether, in view of the references disclosing the use of hydrocarbon oil in the *forward-run cycle* for the purpose of enriching the gas, it would involve invention to substitute such oil for "finely divided material which apparently was coal" in the *back-run cycle* in order to secure a gas of increased hydrogen content, lowered specific gravity, and increased volume.

It is conceded by counsel for appellants that "coal and oil are both hydrocarbons." It is contended, however, that they are not equivalents in the art here involved.

It is obvious, we think, that coal and oil are no more equivalents in the manufacture of carbureted water gas, than in many other of the variety of uses to which they may be put.

The specification in the Young patent, No. 1,751,849, shows evidence of great care in its preparation. The patentee's application was filed June 22, 1922, but it was not until October 10, 1929, long after appellants' application was filed, that it occurred to the patentee that the introduction of oil in the back-run cycle was of sufficient importance to warrant a statement of it in his specification.

We think it is a fair deduction, and one to which appellants are fully entitled, that the reason the patentee did not disclose and claim the involved invention in his original application was because its importance had not then occurred to him.

In view of the facts of record, we are of opinion that appellants' process, which is new, useful, and an important contribution to the art, was not obvious to those skilled therein; that it involves invention; and that appellants are entitled to a patent therefor.

The appeal is dismissed as to claim 10.

For the reason stated, the decision of the Board of Appeals is reversed as to claim 9.

Modified.

U. S. Court of Customs and Patent Appeals

IN RE OAKLEY

No. 3,561. Decided December 24, 1934

PATENTABILITY — PROCESS OF MELTING AND REFINING GLASS.

Claims for a process of melting and refining high borosilicate glasses *Held* unpatentable since applicant is seeking through such claims to secure the use of a particular kind of a furnace to be used in melting such glass and the invention, if any, does not lie in such process but in the apparatus.

APPEAL from the Patent Office. Affirmed.

Mr. W. M. Dorsey for *Oakley*.

Mr. T. A. Hostetler and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.*:

This is an appeal from a decision of the Board of Appeals of the United States Patent Office, affirming that of the Examiner, rejecting all the claims of appellant's application. The claims are all process claims and are numbered 1 to 5, inclusive. Claim 2 is illustrative of the subject matter on appeal and reads as follows:

2. The hereinbefore described process of melting and refining high borosilicate glasses in a container of high alumina content and low flux content, the refractory containing a high percentage of alumina as such.

The references cited are: Smith, 1,500,651, July 8, 1924; Shively, 1,575,514, March 2, 1926; Crawford, 1,630,892, May 31, 1927; The Glass Industry (Tank Vol. 7, No. 11.

The application relates to a process for melting borosilicate glasses. The process disclosed is one of melting and refining glasses of the character named in a container or furnace, the glass-contacting walls of which are of high alumina content and low flux content.

The patent to Smith relates to a glass-making apparatus, including a closed tank in which a body of molten glass is accumulated.

The patent to Shively relates to apparatus for making glass and process therefor, in which glass is melted in a container.

The patent to Crawford relates to a tank block for glass furnaces in which the tank for holding molten glass is made up of courses of flux blocks.

The pages from the publication "The Glass Industry" disclose the use of containers with refractories containing from 65 to 80 per centum of alumina. The only other ingredients mentioned for the refractories are silica and zirconia. The article refers to "refractories consisting chiefly of alumina and silica."

Both the Examiner and the Board of Appeals held that any process disclosed in appellant's application for melting borosilicate glasses is disclosed by the Shively and Smith patents, and both tribunals held that the particular composition of the refractory material lining the container or furnace claimed by appellant is disclosed in the publication "The Glass Industry."

As we view the decisions of the Patent Office tribunals, each held that the particular composition of the refractory material used in constructing the container or furnace constituted no part of the process of melting glass; and secondly, that if the use of such refractory material might be considered as a part of the process of melting glass, such material as defined in appellant's claims was old, as shown by the reference "The Glass Industry," and there would be no invention in the use of such material by appellant in melting glass.

We do not find it necessary to consider this second ground of rejection for the reason that we are satisfied that the character of the furnace used by appellant can not lend patentability to his process claims here involved. Appellant's counsel in his brief states:

It is appellant's contention that as the refractory in question produces a superior glass, when used as a container for melting and refining the glasses of the character specified, over the glass which would be produced if another type of refractory were used, such use constitutes an invention which, if novel, may be protected by a process claim, and that invention was involved in selecting the material in question as the refractory in which to melt the high boro-silicate glass, as such selection was not only not obvious but was opposed to the generally accepted view in the art.

Clearly appellant's only claim to invention lies in the selection of the refractory material lining his container or furnace. He does not contend that there is any reaction between such refractory material and the molten glass. Appellant's brief states:

Appellant does not contend that there is any novelty in melting glass in a clay container. Nor does he contend that a refractory containing a high percentage of aluminum oxide is novel. Indeed, there are in the art refractories consisting of nothing else but aluminum oxide as such, although an example of such a refractory is not in this record.

It appears to us that appellant is seeking, through a process claim, to secure a patent monopoly upon the use of a particular kind of furnace for use in melting borosilicate glass. If that is true, his invention does not lie in a process of melting such glass but in apparatus used in melting such glass. Upon oral argument appellant's counsel expressed the opinion that an apparatus claim for the particular kind of container or furnace employed by appellant would not be patentable because of the prior art. If this be true, we do not understand upon what theory a process claim, depending wholly for its validity upon the type of furnace used, could be sustained.

However, we are not concerned here with the question of whether an apparatus claim for a container or furnace having the refractory material specified by appellant would be allowable. We agree with the statement of the Examiner that—

If there is any invention in applicant's disclosure, it would appear to be in the particular refractory composition *per se* and not as presented in the claims as a method of melting.

Assuming that a container or furnace having refractory material as specified by appellant was not patentable to him as an apparatus, it follows that others would have the right to use such a container or furnace for melting glass, the method of melting glass in a container concededly being old. If that be true, surely appellant could not properly be granted a patent monopoly for accomplishing the same purpose through the process claims here involved. On the other hand, if a container or furnace having the refractory material specified by appellant be patentable, then appellant's invention lay in devising such a furnace or container, and not in a process of melting glass.

In the consideration of process claims we have heretofore cited with approval the following from the opinion in the case of *In re Weston*, 17 App. D. C. 431:

It seems to us from all these authorities the deductions to be drawn are these: First, that processes involving a chemical or other elemental action, if new and useful, are patentable; second, that a process, which amounts to no more than the mere function of a machine, is not patentable; third, that a process or method of a mechanical nature, not absolutely dependent upon a machine, although perhaps best illustrated by mechanism, may, if new and useful, be the proper subject of a patent, even though it involves no chemical or other elemental action.

The foregoing was quoted and approved by us in the case of *In re Ernst et al.*, 21 C. C. P. A. (Patents) 1235, 71 F.(2d) 169. It is clear that

appellant's claims here in issue do not come within the rule laid down in said case of *In re Weston*, supra.

In the case of *In re Weeks*, 18 C. C. P. A. (Patents) 1234, 48 F.(2d) 662, we said with respect to a method claim there involved:

> • • • At most the claim does no more than describe the method by specifying the apparatus used in the operation. This is not sufficient. • • •

In support of the foregoing we cited the case of *In re Weston*, supra.

We do not deem it necessary to enter upon a discussion of the general law relating to process claims. There are no doubt many cases where it is difficult to determine whether an invention should be the subject of apparatus or process claims, or both, but we are clear that in the case at bar the claims are not allowable as process claims.

The decision of the Board of Appeals is affirmed.

Affirmed.

Patent Suits

[Notices under sec. 4921, R. S., as amended Feb. 18, 1922.]

1,231,764 (*a*), F. Lowenstein, Telephone relay; 1,618,017, same, Wireless telegraph apparatus; 1,403,475, H. D. Arnold, Vacuum tube circuit; 1,403,932, R. H. TRADE-MARKS

OFFICIAL GAZETTE, MAY 21, 1935

[VOL. 454. No. 3]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly-Prepared Materials

Ser. No. 358,964. A/S NORWEGIAN TALC, Aasane, near Bergen, Norway. Filed Dec. 6, 1934.

ALUMIT

For Minerals—Namely, Talc, Graphite, and Mica.
Claims use since June, 1933.

Ser. No. 363,085. AMERICAN MAIZE-PRODUCTS COMPANY, New York, N. Y. Filed Mar. 28, 1935.

RAYDEX

For Corn Sugar for use in Processing Certain Fabrics.
Claims use since Mar. 1, 1935.

Ser. No. 363,309. ALLIED KID COMPANY, Boston, Mass. Filed Apr. 2, 1935.

E
N
E N A M O
M
O

For Finished Leather.
Claims use since Jan. 10, 1935.

Ser. No. 363,387. FARM SERVICE STORES, INC., Minneapolis, Minn. Filed Apr. 4, 1935.

GOPHER

For Seeds, Particularly Field, Lawn, and Garden Seeds.
Claims use since Mar. 22, 1935.

For Plain and Mint Flavored Cod Liver Oil and Cod Liver Oil Wafers, Lozenges, Tablets, and Gelatine Capsules.
Claims use since April, 1923.

Ser. No. 361,760. MORNINGSTAR, NICOL, INC., New York, N. Y. Filed Feb. 23, 1935.

MORNING STAR PRODUCTS EST. 1851

PENETRA SET

No claim is made to the words "Products" and "Set" apart from the mark.

For Chemical Preparation in Liquid Form Used in the Processing of Acetate and Rayon Yarns.

Claims use since July 5, 1933.

Ser. No. 361,761. MORNINGSTAR, NICOL, INC., New York, N. Y. Filed Feb. 23, 1935.

MORNING STAR PRODUCTS EST. 1851 SYNTHOGEL

No claim is made to the word "Products" apart from the mark as shown.

For Chemical Preparation in Powder Form Used in the Processing of Acetate and Rayon Yarns.

Claims use since Nov. 19, 1929.

Ser. No. 361,888. ADAM NAOUM ISCHLONDSKY, Paris, France. Filed Feb. 27, 1935.

KENACTAN

For Preparation for Glandular Troubles, Diseases of the Nervous System, for Use in Arterio-Sclerosis, Heart Trouble, Tuberculosis, Furunculosis, Pneumonia, Influenza, Gonorrhea, Conjunctivitis, Blepharitis, Anaemia, and General Metabolic Disturbances, said Preparation Being Prepared in the Form of a Liquid for Intramuscular Injections.

Claims use since Aug. 21, 1934.

Ser. No. 362,109. FONTANA & ALISON COMPANY, Rosebank, N. Y. Filed Mar. 4, 1935.

Fontalis Herbs

Applicant disclaims the word "Herbs" apart from the mark as shown.

For Prepared Medicinal Herbs for Making Infusions for Use as an Aid in the Treatment of Diabetes.

Claims use since Jan. 21, 1935.

Ser. No. 362,200. VITA-B CORPORATION, New York, N. Y. Filed Mar. 6, 1935.

VITA-B

For Therapeutic Preparation Containing Vitamins B and G.

Claims use since Feb. 1, 1935.

Ser. No. 362,244. WILLIAM F. WALPOLE, doing business as The Walton Company, St. Joseph, Mo. Filed Mar. 7, 1935.

GLANNUX COMPOUND TABLETS

No claim is made to the words "Compound Tablets" apart from the mark.

For Tonic Tablets.

Claims use since June 1, 1927.

Ser. No. 362,301. R. J. FITZSIMMONS CORPORATION, New York, N. Y. Filed Mar. 9, 1935.

M P G

For Photographic Chemicals for Fine Grain Developing of Negative Photographic Material.

Claims use since Nov. 15, 1933.

Ser. No. 362,370. GEORGE R. MAYO, doing business as Mayo Company, Pasadena, Calif. Filed Mar. 11, 1935.

SNORE NO MORE

Applicant disclaims the words "Snore No More" apart from the mark as shown.

For Salve for External Use for the Relief of Snoring.

Claims use since Mar. 1, 1935.

Ser. No. 362,378. PARFUMERIE ST. DENIS, New York, N. Y. Filed Mar. 11, 1935.

The GRENADIER

For Astringents, Astringent Cerates, Bleach Creams, Beauty Creams, Cold Creams, Cleansing Creams, Obesity Creams, Obesity Astringents, Dry Rouges, Liquid Rouges, Face Bleaches, Face Packs, Skin Whitener in Liquid, Cream and Solid Form, Eyebrow and Eyelash Grower, Eye Drops, Eyebrow Pencils, Chemical Preparations Suitable for the Darkening of Eyebrows and Eyelashes, Hand Lotions, Skin Lotion, After Shaving Lotions, Pomades, Face Powders, Talcum Powders, Body Powder, Sachets, Hair Salves, Hair Elixirs, Dandruff Preparations, Hair Tonics, Hair Oils, Shampoos, Hair Dyes, Bath Salts, Smelling Salts, Lip Sticks, Incense, Tooth Powders, Mouth Washes, Dentifrices, Depilatories, Tooth Pastes, Nail Creams, Nail Bleaches, Nail Powders, Nail Polishes, Witch Hazel, Peroxide, Petroleum Jellies, Witch Hazel Salves, Camphor Creams, Foot Powders, Corn Salves, Deodorants, Disinfectants, Bay Rum, Perfumes, and Toilet Waters.

Claims use since July 12, 1934.

Ser. No. 362,384. SPRATT'S PATENT (AMERICA) LIMITED, London, England. Filed Mar. 11, 1935.

SPRATT'S "RECTO"

For Aquarium Rectifier, Being a Combination of Mineral Salts Intended to Replace Minerals Lost in the Course of the Life of an Aquarium.

Claims use since Mar. 1, 1935.

Ser. No. 362,398. HENRY W. ALLEN, Ridgefield, Conn. Filed Mar. 12, 1935.

PURITY QUALITY DEPENDABILITY VAC-U-ETTS

No claim is made to the words "Purity", "Quality", and "Dependability" apart from the mark.

For Laxative.

Claims use since October, 1919.

Ser. No. 362,503. JOHN M. BAIR, doing business as The Kep-All Company, New York, N. Y. Filed Mar. 14, 1935.

KEP-ALL

For Preparation for Supplying Organic Sea Minerals in Readily Assimilable Form.

Claims use since Jan. 2, 1935.

Ser. No. 362,504. JOHN M. BAIR, doing business as The Kelp-All Company, New York, N. Y. Filed Mar. 14, 1935.

KELP-ALL

No claim is made to the word "Kelp" apart from the mark shown.

For Preparation for Supplying Organic Sea Minerals in Readily Assimilable Form.

Claims use since Jan. 1, 1935.

Ser. No. 362,505. JOHN M. BAIR, doing business as The Kelp-O-Mol Company, New York, N. Y. Filed Mar. 14, 1935.

Kelp-O-Mol

No claim is made to the word "Kelp" apart from the mark as shown.

For Preparation for Supplying Organic Sea Minerals in Readily Assimilable Form.

Claims use since Jan. 2, 1935.

Ser. No. 362,625. DELLA MOSER, doing business as Dellamo, Decatur, Ind. Filed Mar. 16, 1935.

The portrait is that of the applicant.

DELLAMO

For Kidney Medicine and a Preparation for the Treatment of Sinus and Catarrhal Ailments.

Claims use since Mar. 1, 1935.

Ser. No. 362,658. ARKANSAS COMPANY INC., New York, N. Y. Filed Mar. 18, 1935.

PARAPON

For Sulphonated Ester Used in the Wet Processing of Textile Fibres.

Claims use since January, 1934.

Ser. No. 362,810. DERMALAB, INC., Winnetka, Ill. Filed Mar. 21, 1935.

Nac-pac

For Material for Use in Facial Treatments.
Claims use since Feb. 6, 1935.

Ser. No. 362,834. MCKESSON & ROBBINS, INCORPORATED, Fairfield and Bridgeport, Conn. Filed Mar. 21, 1935.

PHOS-CAL

(FROM MILK)

No claim is made to the words "From Milk" apart from the mark shown.
For Medical Preparation Derived from Milk for the Treatment of Calcium and Phosphorus Deficiency.
Claims use since Feb. 25, 1935.

Ser. No. 362,854. WINTHROP CHEMICAL COMPANY, INC., New York, N. Y. Filed Mar. 21, 1935.

ADAGOL

For Vitamin A and D Concentrate.
Claims use since Feb. 26, 1934.

Ser. No. 362,855. YARDLEY & CO., LIMITED, London, England. Filed Mar. 21, 1935.

SCINTILLA

For Liquid Perfumes, Face Powder, Face Creams, Hair Shampoos, Bath Salts, and Dusting Powder for Use After Bathing.
Claims use since June, 1934.

Ser. No. 363,037. GEO. L. BURG, doing business as Imperial Manufacturing Company, St. Paul, Minn. Filed Mar. 27, 1935.

MARLENE

For Liquid Wave Set, Wave Set Powder, Hair Oil, Brilliantine and Hand Lotion.
Claims use since Oct. 23, 1931.

Ser. No. 363,206. CHERAMY, INC., New York, N. Y. Filed Mar. 30, 1935.

Cordon Bleu

For Eau de Cologne, Perfume, Face Powder, Talcum Powder, Bath Salts, Brilliantine Bandoline, Rouge, Lip Sticks, Dusting Powder, Sachet, Cold Creams, Lotion for the Skin and Hair, Powder and Rouge Compacts, and Eau Vegetable.
Claims use since Mar. 28, 1935.

Ser. No. 363,247. FREDERIC VINCENT, doing business as Health Distributing Company, San Francisco, Calif. Filed Mar. 30, 1935.

Black Oxen

For General Tonic.
Claims use since Feb. 28, 1935.

Ser. No. 363,327. THE MATHIESON ALKALI WORKS (INC.), New York, N. Y. Filed Apr. 2, 1935.

LO-BAX

For Hypochlorite Product Used as a Bactericide, Germicide, Fungicide, Disinfectant, and Deodorizer.
Claims use since Mar. 19, 1935.

Ser. No. 363,371. THE E. L. PATCH COMPANY, Stoneham, Mass. Filed Apr. 3, 1935.

GADOMENT

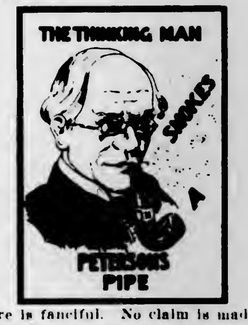
For Ointment for Burns and Other Skin Injuries.
Claims use since Nov. 5, 1934.

Ser. No. 363,451. GEORG BISSANTZ, Billigheim, Germany. Filed Apr. 6, 1935.

Perasthman

For Preparations for the Treatment of Asthma.
Claims use since 1927.

Ser. No. 363,758. KATRO-LEK LABORATORIES INCORPORATED, Boston, Mass. Filed Apr. 15, 1935.



KATRO

For Medicine for Certain Stomach Disorders; Nasal Jellies, Particularly Analgesic Balm; Rheumatic Balm; and Cough Medicines, Particularly Cough Balsam.
Claims use since 1918.

CLASS 8

Smokers' Articles, Not Including Tobacco Products

Ser. No. 362,843. HARRY L. ROGERS, New York, N. Y. Filed Mar. 21, 1935.

The picture is fanciful. No claim is made to the word "Pipe" apart from the mark as shown.
For Pipes, and Cigar and Cigarette Holders.
Claims use since January, 1920.

CLASS 13

Hardware and Plumbing and Steam-Fitting Supplies

Ser. No. 363,014. OIL WELL SUPPLY COMPANY, Dallas, Tex. Filed Mar. 26, 1935.

IMPERIAL

For Hose Clamps.
Claims use since Dec. 18, 1917.

CLASS 14

Metals and Metal Castings and Forgings

Ser. No. 363,105. MORRIS H. LEVINE, doing business as M. H. Levine Co., New York, N. Y. Filed Mar. 28, 1935.

FLORAFOIL

For Aluminum Foil for Useful and Decorative Purposes.
Claims use since July 1, 1934.

CLASS 16

Paints and Painters' Materials

Ser. No. 360,373. THE PURE OIL COMPANY, Chicago, Ill. Filed Jan. 17, 1935.

PUROFANE

For Cleaning and Polishing Preparations for Use in Cleaning and Polishing Automobiles and Furniture in One Operation.
Claims use since Jan. 14, 1935.

Ser. No. 362,113. HIG FURNITURE POLISH CO., Brooklyn, N. Y. Filed Mar. 4, 1935.

HiG

For Furniture Polish.
Claims use since Jan. 7, 1935.

REISSUES

MAY 21, 1935

19,572

STOCK QUOTATION PROJECTION MACHINE AND METHOD FOR FEEDING TAPE THERETHROUGH

James W. Decker, New York, N. Y.

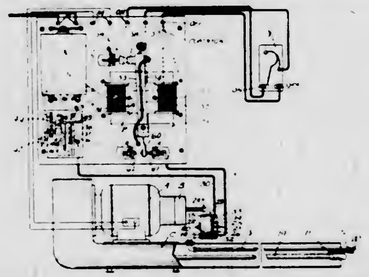
Original No. 1,903,806, dated April 18, 1933, Serial No. 249,383, January 25, 1928. Renewed February 16, 1932. Application for reissue July 1, 1933, Serial No. 678,697

20 Claims. (Cl. 88—24)

1. The combination with a ticker tape, of a ticker having a printing mechanism for printing positive type impressions on said ticker tape and having a feeding mechanism for imparting a feeding impulse to said tape after a printing impression, a projecting mechanism having a horizontally disposed light aperture, a right angularly bent guide for twisting the tape through a right angular path of movement for inverting the tape and guiding the tape so inverted over said light aperture, a projecting lens above said light aperture for receiving images of the configurations on said tape, a deflector above said lens for receiving images from said lens, and a screen above said lens for receiving images from said deflector.

19,573

LIQUID FUEL FEEDING DEVICE AND SAFETY MECHANISM IN CONNECTION THEREWITH



Walter W. Williams, Bloomington, Ill., assignor to Williams Oil-O-Matic Heating Corporation, Bloomington, Ill., a corporation of Illinois

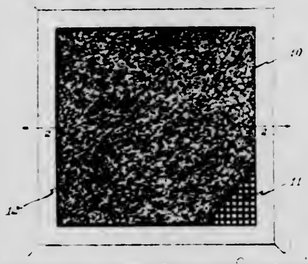
Original No. 1,691,002, dated November 6, 1928, Serial No. 660,314, August 31, 1923. Renewed January 20, 1926. Application for reissue December 30, 1929, Serial No. 417,539

16 Claims. (Cl. 158—28)

1. In a liquid fuel burning system comprising means for atomizing a fuel mixture, a pilot light, and safety mechanism for controlling the action of said atomizer, including a retarder switch having a heating coil thereon, and a diaphragm member controlled by the heat given off by the pilot light, the action of said diaphragm controlling the action of the retarder switch.

15. In a fluid fuel burning system, including a combustion chamber, means for delivering a fluid fuel mixture to said chamber, means for delivering supplemental air to the ignited fuel, means to introduce hot products of combustion into the fuel mixture actuated by the fuel delivering

means, means normally rendering the delivery means inactive upon the cessation of the introduction of the products of combustion into the fuel mixture.



19,574

PROJECTION SCREEN

Theodore F. Yagle, Philadelphia, Pa., assignor to Radio Corporation of America, New York, N. Y., a corporation of Delaware

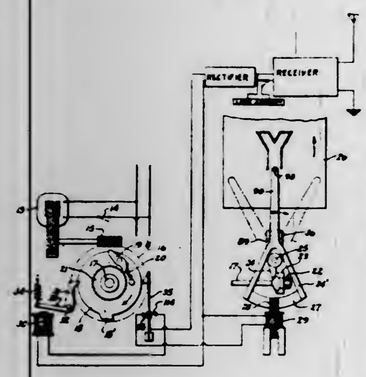
Original No. 1,876,269, dated September 6, 1932, Serial No. 400,109, October 16, 1929. Application for reissue August 22, 1933. Serial No. 686,228

8 Claims. (Cl. 88—24)

7. A projection screen for motion pictures comprising a foraminated backing, a facing of irregularly disposed matted fibres on said backing, and a plurality of globular elements interspersed throughout said fibres for diffusing light projected onto said screen.

19,575

IMAGE BROADCASTING SYSTEM



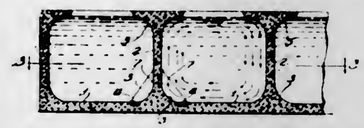
William G. H. Finch, Washington, D. C.

Original No. 1,985,654, dated December 25, 1934, Serial No. 717,304, March 26, 1934. Application for reissue March 23, 1935, Serial No. 12,704

47 Claims. (Cl. 178—5)

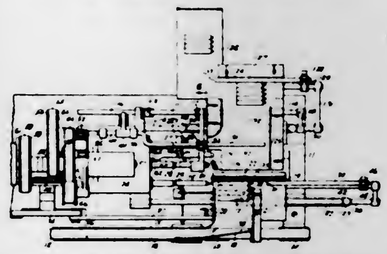
26. In a facsimile system; a receiver comprising a pivoted arm; a rotatable motor; means including a cam driven by said motor and a follower for said cam secured to and driving said pivoted arm for translating the rotation of said motor into a reciprocating motion for rocking said arm

about its pivot in a reciprocating movement for line for line scanning; and means responsive to



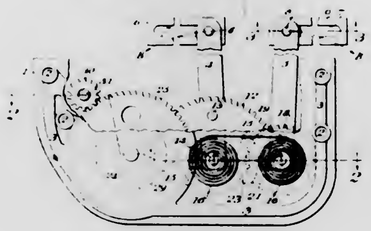
received facsimile signals for rocking said arm in response to received impulses for making a record.

19,576
TELESCOPIC UMBRELLA
Hans Haupt, Berlin, Germany
Original No. 1,902,263, dated March 21, 1933, Serial No. 475,647, August 16, 1930. Application for reissue March 19, 1935, Serial No. 11,832. In Germany July 19, 1930
8 Claims. (Cl. 135—25)



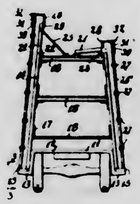
1. An umbrella of the character described, comprising a stick composed of telescopically connected sections, ribs composed of slidably connected sections, a runner on the stick, stretchers connecting said runners with the outer rib sections, a sleeve arranged to slide on the stick, and auxiliary struts pivoted at one end to said sleeve and at the other end to the central portions of the stretchers for supporting the latter in the open position of the umbrella, said struts being formed with knees adapted to bear against and exert outward pressure on the stretchers when the umbrella is closed.

19,577
PURIFICATION OF SEWAGE AND OTHER LIQUIDS
Walter Jones, deceased, late of Stourbridge, England, by Activated Sludge, Inc., Chicago, Ill., assignee, a corporation of Delaware
Original No. 1,341,561, dated May 25, 1920, Serial No. 316,224, August 8, 1919. Application for reissue February 16, 1935, Serial No. 6,912
4 Claims. (Cl. 210—8)



1. In a purification system, a tank divided into a plurality of communicating open chambers serially connected with one another, each chamber having its sewage inlet at one end and its sewage outlet at the other end, an air supplier for each chamber extending substantially continuously throughout the length thereof nearer to one of the side walls of said chamber than to the opposite wall of said chamber, the side walls of each chamber being formed to direct the flow of liquid under the pressure of said air supplier in a circular path within the chamber, and the flow of sewage through each chamber from the inlet at one end to the outlet at the other end being continuous, causing a generally spiral flow of the sewage within each chamber.

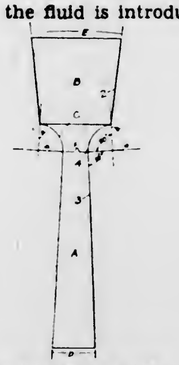
19,578
AUTOMATIC TUBE FINISHING AND ADVANCING MACHINE
Walter Prussing, Brooklyn, N. Y., assignor to Victor Metal Products Corporation, Brooklyn, N. Y., a corporation of New York
Original No. 1,910,712, dated May 23, 1933, Serial No. 526,625, March 28, 1931. Application for reissue January 12, 1934, Serial No. 706,411
30 Claims. (Cl. 29—38)



1. In a tube finishing machine, a turret intermittently revoluble between a series of stations, a series of revoluble mandrels carried by the turret, means for mounting a thin, collapsible tube on a mandrel at one station, means for trimming both ends of the tube at the next station, and to separate a cylindrical waste piece from the remainder of the tube, means for threading the neck of the tube at the next succeeding station, a tube-engaging member, and means for moving the member coaxially of and also toward the mandrel into engagement with the outermost cylindrical surfaces of the tube and the waste piece for automatically dismounting the finished tube and the waste piece simultaneously at the last station, after the tube has been mounted, trimmed, and threaded.

19,579
WINDOW CONTROL MECHANISM
John H. Roethel, Detroit, Mich.
Original No. 1,974,196, dated September 18, 1934, Serial No. 616,511, June 10, 1932. Application for reissue February 11, 1935, Serial No. 6,007
19 Claims. (Cl. 268—126)

1. In a window control mechanism, a pair of swinging bars adapted to be connected to a glass supporting channel, a vertically arranged plate for the support of the said mechanism, a gear to which the lower end of one of the said bars is secured, a second gear secured to the lower end of the other bar and having a toothed portion of the same diameter as that of the first-named gear and meshing with the same, another portion of said second named gear having teeth formed so as to produce a gear of a greater diameter than the first named portion thereof.



19,580
PLATE GLASS TRANSPORTING TRUCK
Louis Rothholz, New York, N. Y.
Original No. 1,879,513, dated September 27, 1932, Serial No. 600,599, March 23, 1932. Application for reissue February 18, 1935, Serial No. 8,332
18 Claims. (Cl. 296—3)

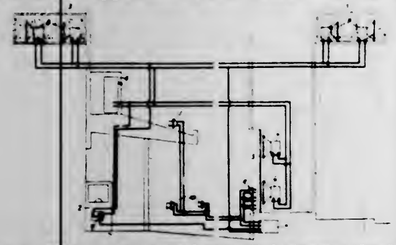
14. The combination with the chassis of a truck of a rigid sheet transporting body comprising frames arranged at the sides of the truck at inclinations towards each other, hinged means on the frames arranged to adjust the frames and horizontal partitions arranged therebetween to form a compartment.

19,581
VENTURI TUBE
Clarence I. Justheim, Salt Lake City, Utah
Original No. 1,973,714, dated September 18, 1934, Serial No. 706,308, January 11, 1934. Application for reissue March 21, 1935. Serial No. 12,305
7 Claims. (Cl. 230—92)

1. In a Venturi tube, the combination of opposed frusto-conical axially aligned chambers joined together by a curved wall with the chamber into which the fluid is introduced of larger

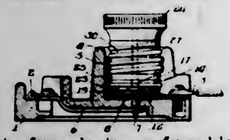
diameter than the other chamber, and with the smaller chamber tangential to the curved wall.

19,582
ALL METAL TIRE COVER
Leonardo Ricci, New Kensington, Pa., assignor of ten per cent to Gaetano Latona and three per cent to Amerigo Posati, both of Arnold Borough, Westmoreland County, Pa.
Original No. 1,917,157, dated July 4, 1933, Serial No. 500,613, December 6, 1930. Application for reissue December 13, 1934, Serial No. 757,405
5 Claims. (Cl. 150—54)



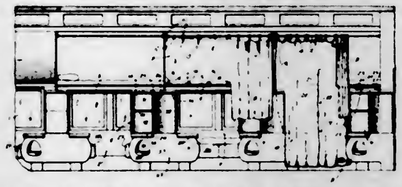
1. In a tire carrier, a casing formed of two hingedly connected sections, a holder having a forward open end carried by and projecting axially from one section, said holder being provided with a tapering open outer end, a sleeve carried by and extending axially from said outer section to receive therein the holder and form a closure therefor, said sleeve being provided with a tapering seat portion arranged interiorly thereof and upon which the tapering forward end of the holder is seated, and a gasket surrounding the said holder and engaging with the inner circumference of the sleeve for preventing the rattling of the sections of the casing when in closed position.

19,583
SOUND REPRODUCING APPARATUS FOR ADVERTISING PURPOSES
Ferdinand G. Salcedo, Hollywood, Calif., assignor to Consolidated Advertising Corp., Ltd., Los Angeles, Calif.
Original No. 1,873,790, dated August 23, 1932, Serial No. 413,911, December 13, 1929. Application for reissue May 21, 1934, Serial No. 726,776
10 Claims. (Cl. 179—100.1)



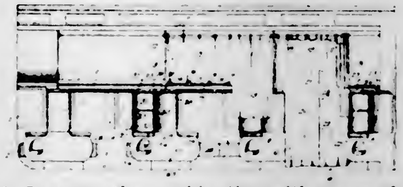
1. In combination, a theater having a sound and picture reproduction apparatus located there-

in, loud speaker units located exteriorly of the theater, microphones located within the theater, an amplifier for the microphones, a control switch in the theater, an electrical circuit between the loud speaker units and the sound and picture reproduction apparatus and controlled by the



switch, and an electrical circuit between the loud speaker units and the microphones and the amplifier therefor and controlled by said switch whereby either music and applause within the theater or movietones from the sound reproduction apparatus may be transmitted exteriorly of the theater.

19,584
SAFETY FUSE DEVICE
Jesse Stone, Pittsburgh, Pa., assignor to Economy Fuse and Manufacturing Company, Chicago, Ill., a corporation of New York
Original No. 1,824,415, dated September 22, 1931, Serial No. 391,450, September 9, 1929. Application for reissue September 21, 1933, Serial No. 690,405
9 Claims. (Cl. 200—119)

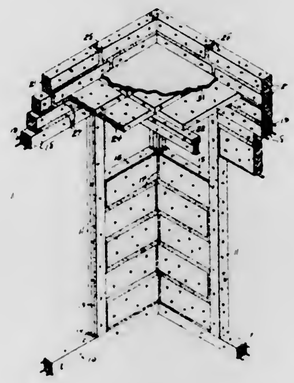


1. In a safety fuse device, a fuse block having a feeder connection, and a branch circuit connection, a ferrule mounted in the block, an adapter having a perforated center, a concentric recess formed in the upper face of the adapter, and a peripheral recess formed in the adapter, a spring locking wire adapted to fit in the peripheral recess, and lock the adapter within the ferrule, a fuse plug having a centrally disposed contact pin therein, a fuse plug disc having a concentric projecting ring thereon formed complementary to the concentric adapter recess, a contact screw mounted in the fuse block, means connecting the contact screw with the feeder connection, and means connecting the contact pin with the branch circuit connection.

19,585
SLEEPING CAR
Trimble de Roode, New York, N. Y.
Original No. 1,834,093, dated December 1, 1931, Serial No. 719,772, June 13, 1924. Renewed March 20, 1930. Application for reissue August 25, 1933, Serial No. 686,809
32 Claims. (Cl. 105—324)

1. In a sleeping car, the combination with upper and lower berths, of step formations for the upper berths associated with the end members of the lower berths, and forming partitions between the lower berths and leg room for the users of the upper berths.

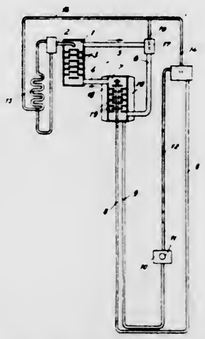
19,586
SLEEPING CAR
Trimble de Roode, New York, N. Y.
Original application June 13, 1924, Serial No. 719,772. Divided and application April 18, 1930, Serial No. 445,369. Patent No. 1,859,730, dated May 24, 1932. Application for reissue August 25, 1933, Serial No. 686,810
43 Claims. (Cl. 105—315)



1. In a car, the combination with a row of upper and lower berth spaces in superposed staggered relation, of berths in said spaces disposed longitudinally of the car with each lower berth overlapped substantially throughout its length by portions of two upper berths, there being a standing space for each upper and for each lower berth disposed adjacent to one another in a row alongside of said berths, the standing space of each upper berth extending down alongside of the side of a lower berth space, the standing space of each lower berth extending up alongside of the sides of two upper berth spaces, and partitions for forming and separating said standing spaces from one another.

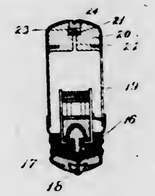
PATENTS

GRANTED MAY 21, 1935



2,001,696
CONCRETE BUILDING CONSTRUCTION
Heriberto Amezcua, Laredo, Tex., assignor of one-fifth to Adolph R. Kahn, Laredo, Tex.
Application August 6, 1934, Serial No. 738,761
3 Claims. (Cl. 72—1)

1. A structure of the kind described comprising precast concrete base beams overlapping each other at their meeting ends and having reinforcements longitudinally therein, precast concrete columns rising from the base beams and having reinforcements projected thereinto, wall slabs arranged between the columns, fluted portions on the columns and slabs, certain of the fluted portions being interlocked with each other, cementitious filling between other fluted portions, upper horizontal beams carried by said columns and overlapped at their meeting ends, spacer blocks carried by the upper horizontal beams and having contracted portions forming ledges, T-shaped supports related with the said horizontal beams, tiles upon said supports and engaged with the ledges formed by the spacer blocks, the reinforcements of the columns being engaged in the said supports, and beveled marginal edges on said tiles and interfitting the spacer blocks.



2,001,697
ABSORPTION REFRIGERATING MACHINE
Edmund Altenkirch, Neuenhagen, near Berlin, Germany, assignor, by mesne assignments, to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application August 14, 1930, Serial No. 475,206
In Germany August 20, 1929
4 Claims. (Cl. 62—119.5)

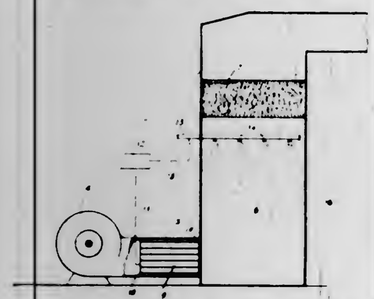
4. The method of causing the circulation of an absorption liquid in a circuit between the absorber and the generator of a continuous absorption refrigerating system which includes the steps of causing the liquid to absorb a gas, in the absorber to thereby increase the density of the absorption liquid and expelling the absorbed gas in the generator to decrease the density of the absorption liquid, and fostering circulation of the liquid under the influence of gravity action on the

portions of the absorption liquid of different density.

2,001,698
RECTIFIER
Henri G. André, Suresnes, France
Application August 24, 1929, Serial No. 388,181. Renewed August 22, 1934. In France October 5, 1928
13 Claims. (Cl. 175—366)

2. A rectifier comprising a cathode having a layer of metallic oxide on its surface, an anode having a layer of a sulphide of an electro-positive metal on its surface, said cathode and anode surfaces being in contact with each other, and concentrated sulphuric acid supplied to said contacting surfaces.

4. The method of making a rectifier which comprises placing on the surface of an oxidizable metal, another electro-positive metal having a stronger affinity for sulphur than said first metal, said second-named metal being in close contact with the surface of said first-named metal, converting the surface of said second-named metal into its sulphide, supplying a concentrated sulphuric acid to the contacting surfaces of said metals, a coating of oxide being formed on the surface of said first-named metal at any time during the above-mentioned steps.



2,001,699
[WITHDRAWN]

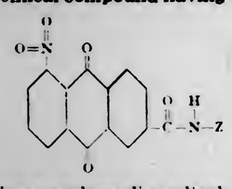
2,001,700

HUMIDIFICATION PROCESS AND APPARATUS EMPLOYING ELECTRICAL ATTRACTIVE FORCES

Hans Barthel, Cologne-Dellbruck, Germany, assignor, by mesne assignments, to Carrier Engineering Corporation, New York, N. Y., a corporation of New York

Application January 13, 1931, Serial No. 508,444
In Germany December 3, 1929
2 Claims. (Cl. 261—117)

1. A method of controlling the moisture content of air, consisting in providing a plurality of water particles charged with electricity of a certain polarity, and routing air equally charged with electricity of opposite polarity through the particles.



2,001,701

1-NITRO-ANTHRAQUINONE-6-ACYL AMINO COMPOUNDS AND THEIR PREPARATION

Earl Edson Beard, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 3, 1932, Serial No. 590,640
10 Claims. (Cl. 260—60)

4. The chemical compound having the formula:

Z representing a carbocyclic radical.

2,001,702

ACYLAMINO-ANTHRAQUINONES AND PROCESS FOR THEIR PREPARATION

Earl Edson Beard, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 25, 1932, Serial No. 619,278
9 Claims. (Cl. 260—60)

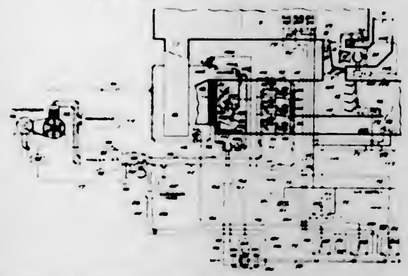
2. The 1-acyl-amino-anthraquinone - 6 - acyl-amino-compound which is substantially identical with that obtainable by condensing a 1-nitro-anthraquinone-6-carbonyl chloride with an amine having at least one hydrogen atom attached to the amine nitrogen atom, converting the resultant to the corresponding 1 - amino-anthraquinone-6-acyl-amino compound and condensing the last mentioned compound with a carboxylic acid halide of the benzene series.

2,001,703

HEATING MEANS FOR TREATING VEGETABLES OR FRUIT

Newman T. Brown, Seattle, Wash., assignor to Albert Peter Grommesch, Seattle, Wash., deceased, now by decree of distribution to Katherine H. Grommesch

Application September 23, 1931, Serial No. 564,698
3 Claims. (Cl. 126—41)



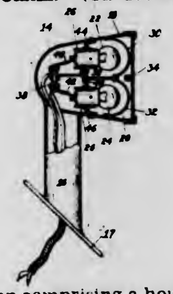
1. A heating means of the character described embodying a heating chamber of inverted U channel form, one leg of said chamber functioning as an article inlet passageway and the other leg functioning as an article outlet passageway; an article inlet port disposed in said article inlet passageway; a fire-box disposed between the leg members of said heating chamber and in communication with the article outlet leg of said chamber at a point above the said outlet port; a draft outlet for said fire-box in communication with the article inlet leg of said heating chamber at a point above the article inlet port; and a conveyor means operatively disposed to move through said heating chamber, whereby a heating means is provided of a form in which the heat may be pocketed and articles passed through said pocket of heat.

2,001,704

APPARATUS FOR COOLING AND VENTILATING BUILDINGS

Claude A. Bulkeley, New York, N. Y., assignor to Niagara Blower Company, New York, N. Y., a corporation of New York

Application April 14, 1933, Serial No. 666,152
18 Claims. (Cl. 257—8)



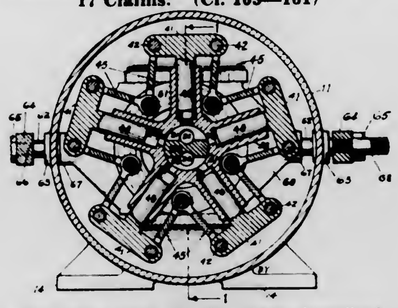
1. In an apparatus for conditioning an enclosure, a multiple pass cooling coil, means for passing air through said cooling coil over the exterior of the pipes thereof and into said enclosure, means for passing a cooling fluid through the inside of the pipes of said cooling coil countercurrent to the flow of air and at an entering temperature substantially below the dewpoint of the air passing said coil whereby said air is dehumidified and cooled to an average temperature substantially above its dewpoint and said cooling fluid is warmed to a leaving temperature substantially above said dewpoint, and means responsive to the air conditions in the enclosure for varying the velocity of said cooling fluid through said coil to vary the cooling and dehumidifying effect of the coil.

2,001,705

SAFETY TURN STOP LIGHT

Patsy Caponi, Philadelphia, Pa., assignor of one-half to Carmela Peroni, Philadelphia, Pa.

Application June 22, 1932, Serial No. 618,599
1 Claim. (Cl. 177—327)



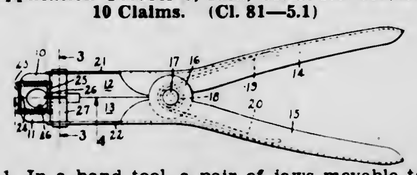
A signal lamp comprising a housing open at one end, a translucent closure for said housing, a partitioning structure comprising a member fastened at points intermediate the ends of the housing to divide it into front and rear compartments, a second member fastened at one end to said first member the other end extending short of said closure to divide the front compartment into two parts, a lamp in each part and mounted on one of said members, colored screens between said closure and lamps each having one edge fastened to said other end of said second member and the other edge freely engaging a wall of the housing, each of said colored screens located so that they do not engage the closure, whereby said partition members, bulbs, and screens form a unitary removable assembly.

2,001,706

VARIABLE CAPACITY PUMP

Hugo Centervall, Brooklyn, N. Y., assignor to Manly Corporation, New York, N. Y., a corporation of Delaware

Application April 28, 1932, Serial No. 607,927
17 Claims. (Cl. 103—161)



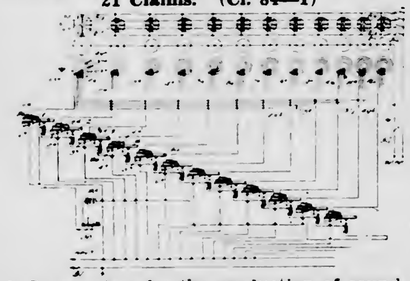
1. In a structure of the class described, the combination of a rotary cylinder structure having radial cylinders, pistons in said cylinders, a rotary member supported on bearings eccentric to the cylinder structure, and articulated connections between the pistons and said rotary member, said connections comprising links extending inwardly from the outer ends of the pistons to said member, said links having their outer ends connected to their respective pistons at points offset from the axes of the pistons circumferentially of the cylinder structure and positioned exteriorly with respect to the bore of the corresponding cylinder.

2,001,707

HAND TOOL

Fred J. Clemens, East Haven, Conn., assignor to K-D Manufacturing Company, Lancaster, Pa., a corporation of Pennsylvania

Application October 5, 1932, Serial No. 636,361
10 Claims. (Cl. 81—5.1)



1. In a hand tool, a pair of jaws movable toward and away from each other, each jaw having relatively movable and opposed members associated therewith, means on each jaw to position a valve spring retainer keeper or the like thereon, and means to continuously urge one of said members toward the other to clamp the keeper or the like therebetween, said means adapted to engage the keepr to urge it toward said positioning means.

2,001,708

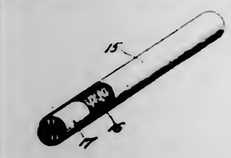
PRODUCTION OF MUSIC

Westley F. Curtis, Washington, D. C.

Application July 30, 1932, Serial No. 626,942
21 Claims. (Cl. 84—1)

1. In a system for the production of sound, an electron tube system having input and output circuits, an electrical sound producer connected with said output circuit, a multiplicity of continuously varying capacitative reactances productive of frequencies corresponding to the frequencies of a musical scale, means for rendering the variation of said varying capacitative reactances periodic, a keyboard operative to selectively associate one or more of said continuously varying capacitative reactances with the input circuit of said electron tube system for correspondingly producing tones in said electrical sound producer, and magnetic means for prolonging the duration of tones produced by said sound producer.

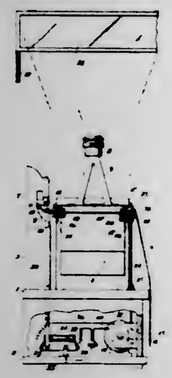
2,001,709



CIGARETTE MOUTHPIECE OR THE LIKE

Glenn Davidson, Bloomington, Ill.

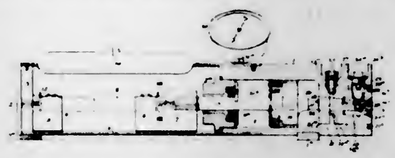
Application February 27, 1932, Serial No. 595,509
15 Claims. (Cl. 131—52)



1. A mouthpiece for cigarettes and the like, comprising a tobacco replacing filler imposing a

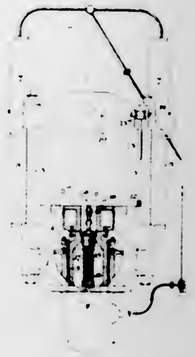
resistance to the passage of the smoke substantially equal to that of a corresponding portion

of replaced tobacco and being formed of material laid in folds longitudinally, such folds varying in width.



2,001,710
STOCK QUOTATION PROJECTING MACHINE
James W. Decker, New York, N. Y.
Application May 23, 1928, Serial No. 280,099
Renewed June 7, 1933
6 Claims. (Cl. 271—2.3)

1. The combination with a ticker tape, of a tape controlling device for controlling the tape as it passes across the light aperture of a projecting mechanism in which the tape is fed to the light aperture by an intermittent vibration transmitting movement, said tape controlling device consisting of two pairs of rollers for gripping said tape, one pair at the supply end of the light aperture and the other pair at the discharge end of the light aperture, said other pair exercising a tension on the portion of the tape located at the light aperture, and means for actuating said rollers.

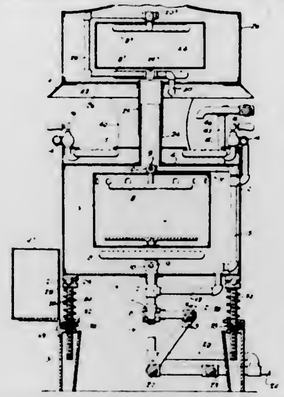


2,001,711
PORTABLE TESTING MACHINE
Richard W. Dinsl, Philadelphia, Pa., assignor, by mesne assignments, to Baldwin-Southwark Corporation, a corporation of Delaware
Application January 14, 1930, Serial No. 420,782
4 Claims. (Cl. 265—14)

3. In a portable testing machine, the combination of a pair of oppositely disposed members horizontally arranged in fixed relation, a fixed head carried by one of said members, a movable head reciprocably mounted with respect to said fixed head and the other fixed member, grips carried by each of said heads between which a test specimen may be held; said last-named fixed member having an elongated chambered body, a piston movably mounted in one chamber of said chambered body, a rod connected to said piston and carrying said movable head, a pump contained in another chamber of said body for directing fluid pressure to the chamber receiving said piston; said piston chamber also providing storage space for said fluid, means for operating said pump; said second fixed member having ports and passages whereby the pumping action may deliver the body of fluid from the storage space to the pressure side of

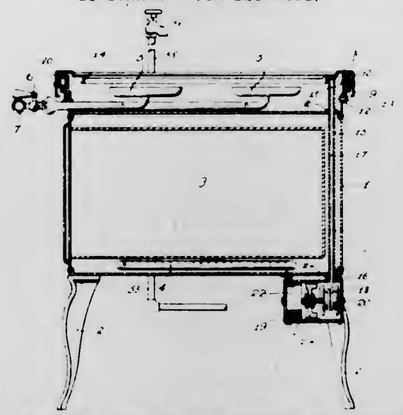
said piston and one of said passages formed in the wall of said body and extending longitudinally of the chambered body with ports and passages affording communication between the same and the spaces of said piston chamber on both sides of said piston and said longitudinal passage, and means for closing one of said ports and passages during a testing operation.

2,001,712
PRESS MECHANISM
Richard W. Dinsl, Philadelphia, Pa., assignor, by mesne assignments, to Baldwin-Southwark Corporation, a corporation of Delaware
Application January 8, 1931, Serial No. 507,498
11 Claims. (Cl. 153—10)



1. The combination with press mechanism including a movable press platen and means for imparting vertical movement thereto, of a flat plate overlying said movable press platen and hinged thereto at one side of the same, and self-releasing means attached to an upper stationary portion of said press mechanism for tilting said plate with respect to its hinged connection with the movable press platen as the latter starts to lower from the limit of its upward movement.

2,001,713
STOVE
Clement Ehret, White Plains, N. Y.
Application August 11, 1933, Serial No. 684,650
18 Claims. (Cl. 126—39)

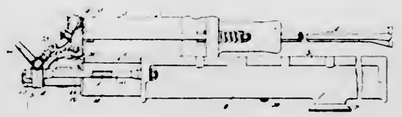


4. A stove embodying a stationary base, a stove body mounted on said base for vertical movement, and means for raising and lowering said stove body with respect to the stationary base, said stove body comprising a source of heat supply

supported on the stove body to be raised and lowered therewith, and means for supporting

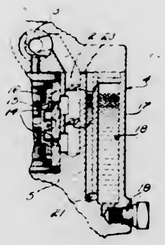
cooking receptacles in cooperative relation to the heat source.

2,001,714
ROTATABLE TOP STOVE
Clement Ehret, White Plains, N. Y.
Application September 8, 1933, Serial No. 688,575
16 Claims. (Cl. 126—214)



1. A stove comprising a stove body having a stove top adapted to support cooking receptacles and at least a portion of which top is rotatable relative to the stove body, and means tending to maintain and normally yieldably maintaining said rotatable portion of the stove top in predetermined angular position with reference to the stove body.

2,001,715
METHOD OF PREPARING ORGANIC DISULPHIDES
Herbert G. M. Fischer, Westfield, N. J., assignor to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application May 13, 1931, Serial No. 537,175
11 Claims. (Cl. 260—16)

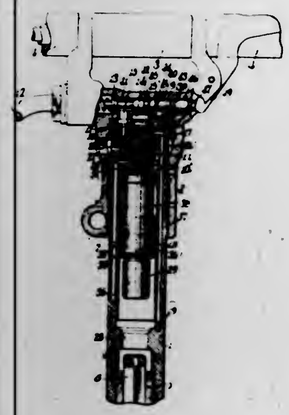


1. Process of preparing an organic di-sulphide, comprising reacting upon an alkyl mercaptan in caustic solution with oxygen at a pressure above atmospheric.

2,001,716
ROCK DRILL
Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application October 1, 1929, Serial No. 396,560
10 Claims. (Cl. 121—9)

1. In a rock drill, a guide shell, a drilling tool guided thereon, and feeding mechanism for the drilling tool including a reciprocable cylinder and a piston element and a connection between said reciprocable cylinder element and the drilling tool whereby the feeding speed of the latter is substantially multiplied.

2,001,717
LUBRICATING DEVICE
Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application June 11, 1931, Serial No. 543,632
18 Claims. (Cl. 184—55)



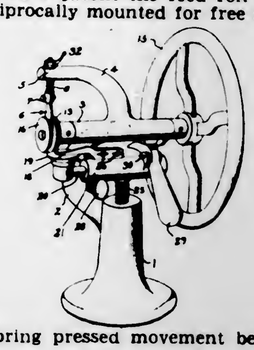
1. In a lubricating device, the combination with a pressure fluid motor having a fluid inlet passage within which pressure fluctuations occur during running of the motor, of means providing a lubricant reservoir, means forming a passage communicating at its lower end with the lower end of said reservoir and at its upper end with said fluid inlet passage, and means forming a relatively restricted passage connecting said second mentioned passage with the upper end of the lubricant reservoir.

2,001,718
ROCK DRILLING MOTOR
Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application May 31, 1932, Serial No. 614,495
22 Claims. (Cl. 121—10)

1. A pressure fluid motor comprising a cylinder, a piston therein, a fluid actuated valve controlling the movements of said piston and having an area normally subjected to constant pressure, a

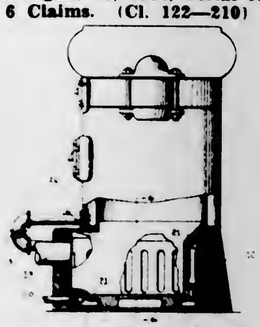
throttle valve for controlling the fluid supply to said motor, and means controlled by said throttle

valve for venting the pressure supplied to said area to interrupt valve movement.



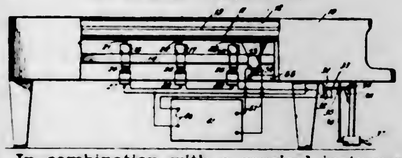
2,001,719
ANCHOR POST
Curtis Greene, San Diego, Calif.
Application August 29, 1932, Serial No. 630,880
7 Claims. (Cl. 189—30.5)

7. A fence post; a helically twisted anchor bar; and diagonally slotted means on the post through which the bar can be driven while in a diagonal position; the bar and the slot of said post means being shaped to co-act with each other to limit the movement of the bar in an anchoring direction.



2,001,720
SHOE CHANNELING AND GROOVING MACHINE
Gedeon Gregoire, Southbridge, Mass.
Application June 28, 1931, Serial No. 547,027
14 Claims. (Cl. 12—27)

1. In a device of the character described, a feed roll, a lip shaping roll having a grooved peripheral edge adjacent the feed roll and cutter means reciprocally mounted for free sliding and

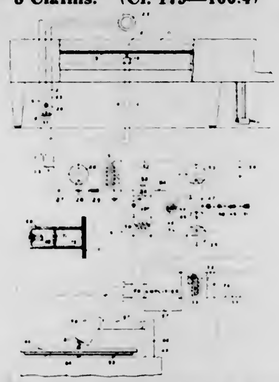


floating spring pressed movement between said rolls.

2,001,721
COMBUSTION CHAMBER HEATING DEVICE
Mora S. Hall, Baltimore, Md., assignor to May Oil Burner Corporation, a corporation of Maryland
Application August 26, 1932, Serial No. 630,543
6 Claims. (Cl. 122—210)

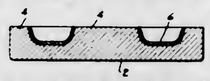
1. In a house heating boiler, a water compartment, a fire pot, a fluid fuel burner in said fire pot, a water lining for said fire pot comprising a vertical wall section and a separate bottom wall section, said wall sections and said water compartment being connected together for fluid circulation, and a coating of plastic refractory material attached to said wall sections, said coating being of adequate thickness to absorb heat and to radiate heat back to the flame of the burner and sufficiently thin to transfer heat therethrough to the fluid in the wall sections.

2,001,722
MUSICAL INSTRUMENT
John Hays Hammond, Jr., Gloucester, Mass.
Application August 15, 1929, Serial No. 386,155
Renewed June 11, 1932
17 Claims. (Cl. 84—1)



1. In combination with a musical instrument having a sounding board, a pick-up device associated with said sounding board and adapted to pick-up energy of vibration therefrom, means for amplifying said energy and means for applying said amplified energy to said sounding board so as to decrease the damping of the vibrations of said board.

2,001,723
REGENERATIVE PIANO
John Hays Hammond, Jr., Gloucester, Mass.
Application June 16, 1932, Serial No. 617,503
22 Claims. (Cl. 84—1)

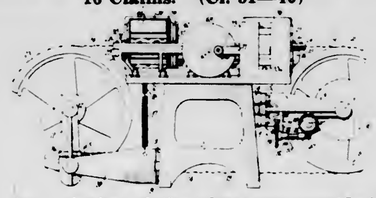


1. In combination with a musical instrument having a sounding board and strings, pickup devices associated with said soundboard and said strings, and adapted to pick up energy of vibration therefrom, means for combining and amplifying said energies and means for applying said amplified energy to said sounding board.

2,001,724
PIANO RECORDING
John Hays Hammond, Jr., Gloucester, Mass.
Application July 15, 1932, Serial No. 622,606
8 Claims. (Cl. 179—100.4)

1. In a sound recording system, a piano, means for picking up the vibrations of said piano, an amplifier for amplifying said vibrations, means associated with said amplifier for varying the amplification factor of same in accordance with the input signal strength so that strong signals are amplified more than weak ones, said latter means being arranged so that its action is retarded so that the initial surge of energy caused by the striking of a note is amplified less than the remaining energy of said note and means for recording said vibrations on a sound record tablet.

2,001,725
ORNAMENTAL PANEL AND THE LIKE OF RUSTLESS STEEL AND VITREOUS ENAMEL
Henry H. Harris, Champaign, Ill.
Application October 21, 1931, Serial No. 570,270
4 Claims. (Cl. 41—30)

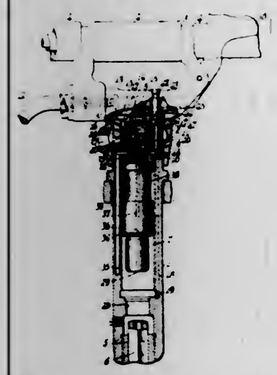


4. Article as in claim 1, and in which the coating applied to the recessed parts is of enamel melting at about 1200–2150° F. and the stainless alloy steel body that is heat treated contains chromium in the general neighborhood of 18% and nickel in the general neighborhood of 8%.

2,001,726
WRITING PEN
Lloyd S. Henwood, Merchantville, N. J., assignor to C. Howard Hunt Pen Company, Camden, N. J., a corporation of New Jersey
Application August 24, 1932, Serial No. 630,192
2 Claims. (Cl. 120—109)

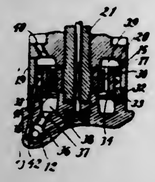
1. The method of manufacturing a pen which includes forming a blank having wings or tabs at opposite sides of the writing tip, bending said wings or tabs downwardly approximately 90° at opposite sides of a central area lying substantially in the original plane of the blank, and thereafter slitting the tip portion of the pen intermediate said wings or tabs through said central area.

2,001,727
AUTOMATIC RAZOR EDGING MACHINE
Arthur J. Holman, Brookline, Mass.
Application November 4, 1929, Serial No. 404,713
16 Claims. (Cl. 51—40)



1. In a device of the character specified, the combination of means whereon a blade may be mounted, slidably mounted carriages supporting rotatable abrading means, means for so supporting and advancing said means whereon the blade may be mounted that the blade may be presented to said rotatable abrading means along a path of travel substantially parallel to the axis of rotation of said abrading means, and means for reciprocating said slidably mounted carriages along said axis simultaneously with the rotation of said abrading means.

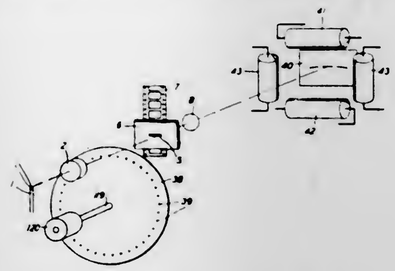
2,001,728
ROCK DRILLING MOTOR
Mervin Chester Huffman, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application June 23, 1932, Serial No. 618,924
6 Claims. (Cl. 121—10)



1. A pressure fluid motor comprising a cylinder having a bore, a piston therein, a fluid actuated distributing valve controlling the movement of

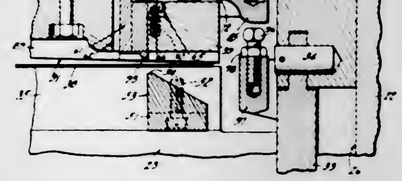
said piston, said valve having an area subjected to constant pressure and a larger opposed area subjected to a piston controlled reduced pressure, a passage connecting said last named area to the

cylinder bore, and means for interrupting operation of said valve and normal operation of the piston including means for supplying live pressure fluid to said larger area continuously and thence through said passage to the cylinder bore.



2,001,729
DRILLING APPARATUS
Mervin Chester Huffman, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application June 1, 1934, Serial No. 728,581
15 Claims. (Cl. 121—7)

1. In a rock drill, drill steel rotation mechanism including relatively rotatable ratchet and pawl carrier elements, operative connections between one of the same and a drill steel to be rotated, means for holding the other element against rotation, means for moving said latter element axially, and means movable axially with said latter element to effect engagement and release of the pawls of the pawl carrier element from the ratchet.

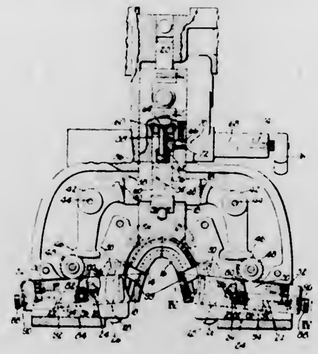


2,001,730
ELECTROOPTICAL SYSTEM
Herbert E. Ives, Montclair, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 11, 1930, Serial No. 487,967
20 Claims. (Cl. 178—6)

1. An electro-optical system for producing an image in color from a color record comprising a screen, means for successively scanning elemental areas of the record with a moving beam of light passing therethrough to project each area in its natural color upon said screen, and a plurality of light sensitive devices each selective of light of a different color band and variably responsive to at least some of the radiations of different wave lengths constituting the band and activated by light reflected from said screen to cause the

simultaneous production of a plurality of separate image currents each representative at any instant of a different color characteristic of the area projected.

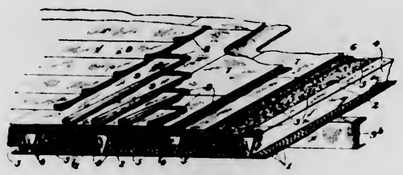
2,001,731
BLANK SHEARING APPARATUS
George R. Jeneson, Cincinnati, Ohio, assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application June 30, 1933, Serial No. 678,518
10 Claims. (Cl. 164—47)



1. In an apparatus for cutting metal sheets to provide blank strips from which can ends and the like may be formed, the combination of opposed shearing dies for shearing longitudinal blank strips from said sheets, and opposed auxiliary dies associated with said shearing dies for cutting recovery pieces from said strips, one of said auxiliary dies being confined within a said shearing die until the latter has completed its shearing operation and being projectable into subsequent cutting operation by the movement of said shearing die.

2,001,732
MACHINE FOR SHAPING SHOE UPPERS
Jacob C. Jorgensen, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application April 26, 1934, Serial No. 722,539
20 Claims. (Cl. 12—4)

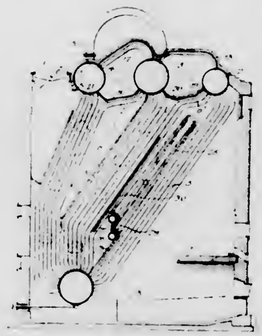
1. In a lasting machine, the combination with shoe-supporting means, of end-embracing wipers, means for imparting to said wipers bodily advancing movement lengthwise of the shoe, and guiding means for the wipers operative in response to the movement of the wipers lengthwise of the shoe



CARNEGIE LIBRARY OF ATLANTA

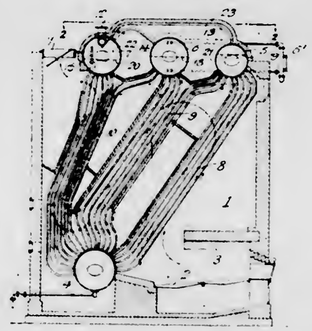
to impart to them closing movements laterally of the shoe, said guiding means being adjustable

to vary the amount of the closing movements of the wipers.



2,001,733
SOUND DEADENING STRUCTURE
George D. Kellogg, Pelham Manor, N. Y., assignor to Johns-Manville Corporation, New York, N. Y., a corporation of New York
Application January 2, 1932, Serial No. 584,446
8 Claims. (Cl. 189—85)

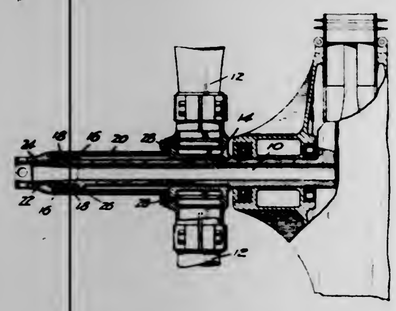
1. A sound-deadening roof comprising in combination a supporting sub-structure, a metal deck in the form of sections provided each with a plurality of imperforate integral beams, flat portions of said deck, intermediate the beams, provided with a multiplicity of perforations adapted to admit incident sound, relatively effective sound-deadening material maintained in position above the perforations and between the beams, and a layer of thermal insulating material placed above the sound-deadening material and adapted to maintain the sound-deadening material in effective condition.



2,001,734
BOILER
Howard J. Kerr, Westfield, N. J., and Ivar L. Langvand, Barberton, Ohio, assignors to The Babcock & Wilcox Company, Bayonne, N. J., a corporation of New Jersey
Application December 6, 1928, Serial No. 324,084
Renewed June 26, 1934
10 Claims. (Cl. 122—302)

1. In a Stirling type boiler, the combination of a rear steam off-take drum, a middle drum, a front drum, a lower drum, a baffle separating a high temperature gas pass from a low temperature gas pass, a first group of tubes in the latter gas pass directly connecting the lower and off-take drums and constituting the only direct connections between said drums, a second group of tubes in the low temperature gas pass directly connecting the lower and middle drums, a third group of tubes in the high temperature gas pass directly connecting the lower and middle drums, a furnace, a second baffle for the third group of tubes, a divided bank of tubes above the furnace and partly in front of the second baffle so as to be exposed to the radiant heat from the furnace

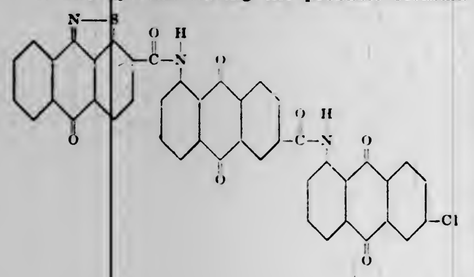
gases, a superheater located between the divisions of the said last mentioned bank of tubes, and steam circulators directly connecting the middle and off-take drums, said first and second groups of tubes constituting the only connections between the water spaces of the middle and off-take drums, said combination acting to decrease the water level in offtake drum with increase in capacity at which boiler is operated.



2,001,735
BOILER
Howard J. Kerr, Westfield, N. J., and Ivar L. Langvand, Barberton, Ohio, assignors to The Babcock & Wilcox Company, Bayonne, N. J., a corporation of New Jersey
Application December 26, 1928, Serial No. 328,570
6 Claims. (Cl. 122—302)

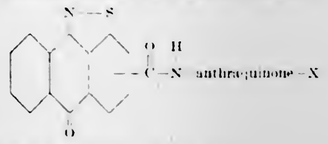
1. In a water tube steam boiler, a boiler setting, a middle steam and water drum located between two similar drums at the top of the setting, tubes leading from said drums to a lower water chamber, primary baffles dividing the tubes into a plurality of separated banks located in separate gas passes extending through the setting, a lower number of tubes in a bank leading to a drum from which a greater number of tubes extend

downwardly through an adjacent gas pass of higher temperature, the tubes in a bank being bent at their upper ends so as to constitute diverging groups of tubes, secondary baffles located between adjacent upper drums and between said diverging groups of tubes, said secondary baffles forming gas pass walls guiding the furnace gases at their turns, a steam off-take connection communicating with the steam space of one of the upper drums, one of the upper drums having no steam circulators directly connecting it with one of the other upper drums, and steam circulators connecting the steam spaces of two of the upper drums, the only water circulator connections between the upper drums being through said groups of tubes which provide recirculation in the upper drums.



2,001,736
POWER TRANSMISSION DEVICE
John E. Larason, Dayton, Ohio
Application July 17, 1934, Serial No. 735,717
15 Claims. (Cl. 170—177)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

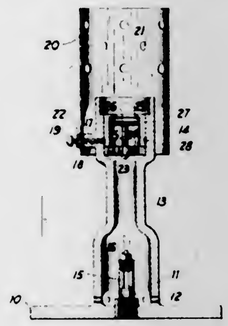
1. In combination, a propeller having a hub portion, an engine shaft extending freely through and beyond said hub portion, and coupling means interconnecting the free end of said shaft and said hub portion for driving said propeller.



2,001,737
ANTHRAQUINONE DERIVATIVES
Ralph Norbeit Lulek, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 18, 1931, Serial No. 557,955
9 Claims. (Cl. 260—44)

3. The dyestuff having the probable formula

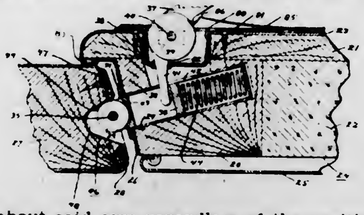
2,001,738
ANTHRATHIAZOLE-ANTHRAQUINONE CARBONYL IMIDES AND PROCESS OF PREPARING THEM
Ralph Norbert Lulek, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application September 27, 1933, Serial No. 691,247
15 Claims. (Cl. 260—44)



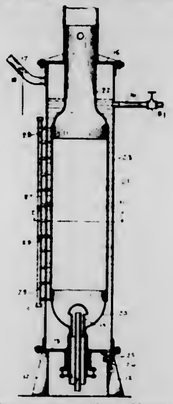
12. The compound having the formula

where X is a member of the group

and



2,001,739
GAS BURNER
John R. MacGregor, Albany, Calif., assignor to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
Application October 3, 1933, Serial No. 691,904
6 Claims. (Cl. 158—112)



5. A gas burner comprising a vertical tube, means for introducing an air-gas mixture into said tube, a perforated baffle in said tube intermediate its length, a second baffle spaced above said first named baffle and of smaller diameter than the bore of said tube, and means above said second named baffle to direct said air-gas mixture toward the axis of said tube.

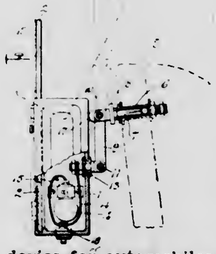
2,001,740
REFRIGERATOR LATCH
Hal W. McPherson, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application October 31, 1931, Serial No. 572,421
6 Claims. (Cl. 292—173)

5. A refrigerator latch including a pivoted handle, a latch means, a latch operating arm forming a part of said handle and extending into an opening, and a gasket of resilient material through which said arm extends to seal the opening about said arm regardless of the position of the handle.

2,001,741
TREATING HYDROCARBON OILS
Randolph J. McRae, New York, N. Y., assignor to Radial Hydrocarbon Processes, Inc., a corporation of Delaware
Application October 29, 1928, Serial No. 315,699
11 Claims. (Cl. 196—63)

1. A process for converting liquid hydrocarbon oil into products of lower boiling points which comprises circulating the oil peripherally in a stationary annular chamber the inner wall of which is a heating member, the velocity of the liquid oil being such as to cause a higher pressure on the outside of the said annular chamber and a resulting film of lighter vapors between the liquid oil and the said inner wall.

9. In an apparatus for converting hydrocarbon oils into products of lower boiling points, the following elements in combination: A heating chamber; means for applying heat thereto; an annular chamber surrounding said heating chamber but having no direct communication therewith; means for introducing hydrocarbon oil into said annular chamber; and means for introducing steam into said annular chamber in a tangential direction, whereby oil contained therein is set in rotary motion.

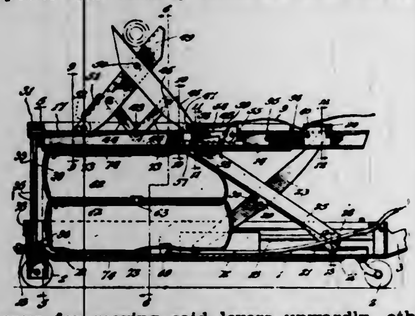


2,001,742
MANUFACTURE OF ARTIFICAL SILK
Adrian J. L. Moritz, Enka, N. C., assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware
Application April 17, 1934, Serial No. 721,044
3 Claims. (Cl. 18—54)

1. The method of producing artificial silk thread and the like of substantially uniform denier, and having improved dyeing properties by gradually increasing the elongation of the thread as it is formed into a package which comprises the steps of extruding the same through a coagulating bath and stretching the thread in its path of travel between the point of extrusion and a collecting device by contacting the thread with a driven godet wheel in such a manner that slippage is permitted thereon, causing the thread

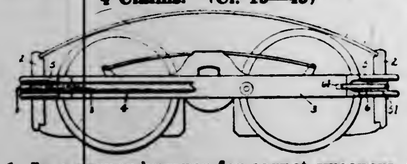
to contact with a second godet wheel rotating at a higher peripheral speed, said contact being sufficient to prevent slippage, and changing the speeds of propulsion of the godet wheels during the spinning period whereby a gradual increase in stretch of the thread is obtained while said slippage compensates for tension variations occurring within and during the path of travel of the said thread.

2,001,743
MIRROR DEVICE
Willard L. Morrison, Chicago, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois
Application October 22, 1931, Serial No. 570,369
2 Claims. (Cl. 240—4.1)



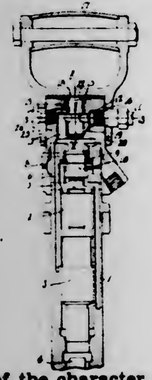
1. A mirror device for automobiles comprising a casing, a mirror mounted in said casing, a light transmitting section below said mirror, a light back of and opposed to said light transmitting section, an electrical receptacle on the automobile, an electrical connection and supporting device adapted to be detachably connected with said receptacle and electrically connected with said lamp, said device including a link connection with said casing, arranged so that the casing may be moved upwardly to a position of use and downwardly out of the way when not in use.

2,001,744
LIFTING JACK
James M. Patterson, San Antonio, Tex.
Application July 20, 1933, Serial No. 681,352
10 Claims. (Cl. 254—2)



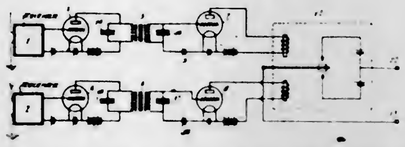
1. A lifting jack comprising a platform, a deck supported above the platform, means for raising and lowering the deck, gripping levers pivoted to-

gether near their working ends and having their opposite ends slidably connected with the deck,



means for moving said levers upwardly, other means for moving the levers downwardly, and means for holding the levers in a set position.

2,001,745
BUMPER FOR CARPET SWEEPERS
Fred W. Fullen, Grand Rapids, Mich., assignor to Bissell Carpet Sweeper Co., Grand Rapids, Mich.
Application January 8, 1932, Serial No. 585,422
4 Claims. (Cl. 15—45)

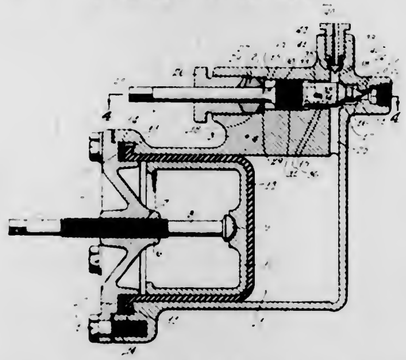


1. In a corner bumper for carpet sweepers, the combination with a naturally straight resilient member of U-cross section, of a metallic strap engaging the web of said member and secured at its ends to the case of the sweeper, the sweeper case having a transverse corner notch or indentation into which said member is forced by said strap.

2,001,746
LUBRICATOR
John L. Reilly, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application January 9, 1934, Serial No. 705,909
3 Claims. (Cl. 121—13)

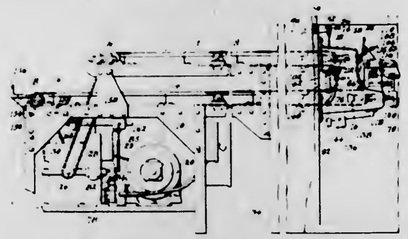
1. In a tool of the character described, a motor including a cylinder and a piston reciprocable therein, a rear head block for said cylinder, a tool supporting member slidably guided on said rear head block, said head block having parallel chambers, a plunger valve reciprocable in one of said chambers and engageable with said tool supporting member and actuated by the latter for controlling the supply of motive fluid to said cylinder, said valve having a recess for receiving lubricant and for conducting motive fluid and said head block having therein a passage controlled by said valve for supplying motive fluid to said cylinder, said other chamber constituting a lubricant reservoir, and passage means controlled by said valve for supplying lubricant from said reservoir for delivery to the motive fluid supply passage, said lubricant reservoir communicating through said passage means with said plunger valve recess when said valve is in one position and said plunger valve recess communicating with said motive fluid supply passage when said plunger valve is in another position.

2,001,747
RECEIVING APPARATUS
Wilhelm Runge, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application July 8, 1930, Serial No. 466,427
In Germany August 20, 1929
5 Claims. (Cl. 250—8)



1. The method of producing currents truly representative in electrical length to the marking and spacing impulses sent out at different frequencies by a transmitting system which includes the steps of, separately receiving said marking and spacing frequencies, rectifying each of said received frequencies to produce unidirectional current impulses, and producing by means of said unidirectional impulses a current flow whose initiation is simultaneous with inception of said impulses but whose duration is independent of the length of said impulses.

2,001,748
CONTAINER CLOSURE
Arthur A. Saalbach, East Orange, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application March 23, 1931, Serial No. 524,563
9 Claims. (Cl. 220—46)

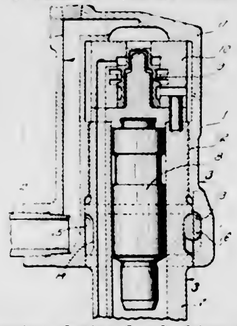


4. The combination of a container, a cover adapted to be compressed thereon, and an annular tubular gasket clamped at its outer portion to the cover and free relative to the cover at its inner portion.

2,001,749
VALVE ASSEMBLY FOR COMPENSATORS
Claude Sauzedde, Detroit, Mich., assignor to Detroit Hydrostatic Brake Corporation, Detroit, Mich., a corporation of Michigan
Application April 11, 1932, Serial No. 604,504
10 Claims. (Cl. 60—54.6)

1. In braking systems operative under hydrostatic conditions and including a pair of individual service lines, a fluid pressure cylinder and piston for each line, means for concurrently actuating the pistons during the brake application cycle, and a supply and regulating unit and its casing, said unit including a supply chamber, individual connections between the unit and the several cylinders, a valve seat between the unit entrances of said individual connections, a valve seat intermediate said supply chamber and one of said entrances, a single manually-operated valve unit for controlling both seats, said valve unit forming the sole control between the supply and the service lines, and pressure means within the supply chamber and operable at will, whereby the valve unit in open position is operative to provide communication between the supply and both cylinders to permit equalization of pressure in the service lines and supply concurrently.

2,001,750
SHOE-CONVEYING SYSTEM
August R. Schoenky, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 24, 1929, Serial No. 416,242
23 Claims. (Cl. 198—20)



1. The combination with an endless conveyer upon which shoes on lasts are placed bottom down, of a member situated at the delivery end of the conveyer and arranged for co-operation with the cone of each last to hold it against tilting forward as it passes over the end of the conveyer.

2,001,751
VEHICLE
William M. Sheehan, Merion, Pa., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware
Application June 25, 1932, Serial No. 619,226
18 Claims. (Cl. 105—364)

1. In a vehicle of the class described, an axle, wheels mounted thereon on opposite sides of the vehicle, a continuous web forming the main elements of the vehicle underframe and also forming a seamless floor having a lower part between said wheels and below the level of the tops thereof, said floor including a portion inclined upwardly from said lower part longitudinally of the vehicle to facilitate the discharge of the vehicle load through the end of the vehicle when the vehicle is tilted longitudinally there being axle mounted structure at the sides of said floor lower part, and floor portions extending upwardly from said floor lower part and outwardly over said axle mounted structure and at substantially the same level from end to end of the vehicle.

2,001,752
SECURING DEVICE
Frank E. Sinclair, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application May 23, 1931, Serial No. 539,512
8 Claims. (Cl. 287—125)

1. A securing device for locking the threaded joint between a pair of relatively rotatable parts against loosening comprising means forming a slot in one part, means forming an annular groove in the other part, and a wedge driven in the space formed by said slot and groove and acting to effect relative movement of said parts in a direction axially of said threaded joint, to bind the threads.

2,001,753
COATED COPPER ARTICLE AND METHOD OF MAKING THE SAME
Robert R. Tanner, Highland Park, and John S. Thompson, Detroit, Mich., assignors to Metal Finishing Research Corporation, Detroit, Mich., a corporation of Michigan
No Drawing. Application June 4, 1934,
Serial No. 728,978
5 Claims. (Cl. 148—6)

1. An article having a surface of copper or copper alloy coated with a substantially integral

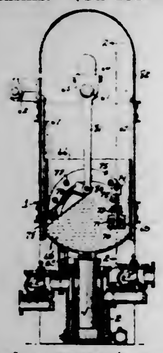
coating of a salt of copper and acid of the group consisting of dicarboxylic and hydroxydicarboxylic acids of the aliphatic series and carboxylic acids, having one carboxyl group, and sulphonic acids of the aromatic series, and benzene phosphonic acid.

2,001,754

METHOD AND MATERIAL FOR PRODUCING PHOSPHATE COATING

John S. Thompson and Van M. Darsey, Detroit, Mich., assignors to Metal Finishing Research Corporation, Detroit, Mich., a corporation of Michigan

No Drawing. Application March 27, 1933, Serial No. 662,998
11 Claims. (Cl. 148—6.5)



1. A process of coating iron or steel which consists in forming a solution containing acid phosphates and a nitrate of an alkali metal, immersing in the solution articles having surfaces of iron or steel, and maintaining the strength of the solution by adding thereto acid phosphates and a nitrate of an element of the class that consists of magnesium, calcium, barium, strontium, manganese, zinc, cadmium and iron, which enter into the coating as bases of phosphates.

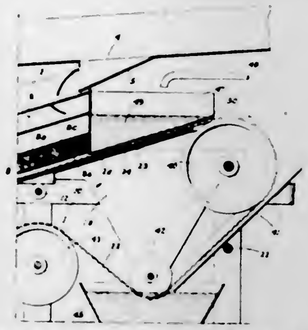
2,001,755

MECHANICAL MOVEMENT

Richard H. Wainford, Trenton, N. J.

Application April 14, 1933, Serial No. 666,193
8 Claims. (Cl. 185—7)

1. A mechanical movement comprising a vertically reciprocatory element, a motor driven crank shaft, a connecting rod coupled thereto, a weight member for gravitally impelling the reciprocatory element in one direction, a beam pivotally connected at one end to the weight member and pivotally and slidably connected at one end to the weight member for a limited independent swinging motion with respect thereto, a rocker arm pivotally connected at one end to the weight member and at its opposite end to the connecting rod and movable by said rod to lift the beam, and a retarding and cushioning means associated with said sliding and pivotal connection and comprising a rocker member having a cushioning chamber therein and a piston movable into and out of said chamber.



2,001,756

MINERAL SEPARATOR

Walter R. J. Woock, Auburn, Calif.

Application August 11, 1933, Serial No. 684,685
1 Claim. (Cl. 209—44)

A mineral separator comprising an inclined sluice box, screening elements arranged therein, a riffle belt one run of which is adapted to move through the box under the screening elements, a flushing tank, the other run of the belt being adapted to move through such flushing tank, means to impart vibration to the box and belt, means to impart motion to the belt in the

direction of the high end of the box, a water pan on the box at its high end, the uppermost end of the pan being open at a level just above the belt, and means to maintain water in the pan to the level of such open end thereby with the vibration of the pan water will be washed over such end onto the belt.

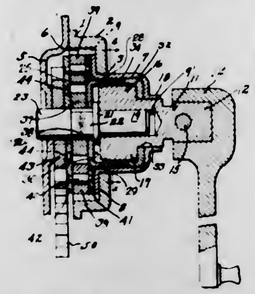
2,001,757

APPARATUS FOR AND PROCESS OF MAKING CYLINDRICAL BODIES

Carl M. Yoder, Lakewood, Ohio, assignor of one-half to Harvey O. Yoder, Lakewood, Ohio

Application October 4, 1930, Serial No. 486,499
22 Claims. (Cl. 153—54)

1. The herein disclosed process of shaping metal blanks into cylindrical form which consists in feeding a metal blank to and through a plurality of passes and first conditioning and finishing the opposite longitudinal side edges of the blank, then in simultaneously bending the opposite outer side portions of the blank on longitudinal lines to curve said portions on predetermined radii and permitting spring-back of the curved portions to larger radii following the bending thereof, respectively to larger radii, then in bending progressively inwardly increments of the blank on longitudinal lines into curved shape on radii equal to said first mentioned predetermined radii and permitting spring back of the curved increments following the bending thereof, respectively, to said larger radii, and finally bending the central longitudinal portion of the blank.



3. In apparatus of the class described, the combination of a support, standards on said support, sets of rolls rotatably mounted in said standards and between which a metal blank is passed, said sets of rolls operating to successively bend progressive portions of the blank from its opposite sides inwardly into curved form, and a pair of rolls disposed at opposite sides of one of said sets of rolls and substantially in the plane thereof for maintaining the curvature of the previously bent portions of the blank and for relieving pressure of the metal blank on the adjacent rolls.

2,001,758

CLUTCH MECHANISM

Alois J. Zwierzina, Detroit, Mich., assignor to Ackerman-Blaesser-Feszey, Inc., Detroit, Mich., a corporation of Michigan

Application November 22, 1932, Serial No. 643,906
2 Claims. (Cl. 192—8)

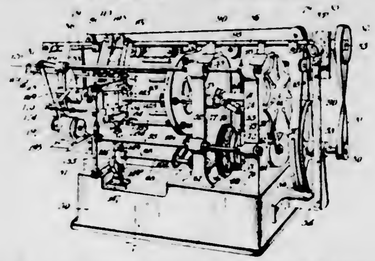
1. A clutch mechanism comprising a housing of L-shaped form in cross section, the peripheral wall of which is internally toothed and the lateral wall of which has a central aperture, a second housing having a body fitting the said aperture and a flange overlying the inner face of the wall of the L-shaped housing, and notched to engage the said teeth thereof, a driving member in the second housing, a driven member having a part extending into the second housing, an expandable coiled spring connected with the said extending part of the driven member and associated with the driving member, said spring normally expanding in frictional contact with the inner wall of the second housing to normally hold the driven member from rotating the driving member and releasable by rotation of the driving member in either direction to thereby drive the driven member, a driving gear in fixed relation with the driven member, a driven gear loosely mounted to turn on the axis of the driving member, a disc to which the driven gear is secured, and pinions on the disc intermediate the driving gear and the internal teeth of the L-shaped housing whereby, through rotation of the driving element, the driven gear is rotated at a less speed.

2,001,759

TYPEWRITING MACHINE

Henry Allen Avery, Groton, N. Y., assignor to L. C. Smith & Corona Typewriters Inc., Syracuse, N. Y., a corporation of New York

Application August 18, 1933, Serial No. 685,693
3 Claims. (Cl. 197—74)



1. A typewriting machine having a main frame, a type basket supporting shift frame, means on said frames forming two up and down extending ball races spaced apart transversely of the machine, a single bearing ball in each ball race for supporting the shift frame for sliding and pivotal movement, a rock shaft journaled on the main frame and extending transversely of the machine, a pair of parallel rearwardly extending rock arms on said shaft, horizontal transversely extending pivots connecting the rear ends of said rock arms to the shift frame at a level below the ball races, cooperating stop means on the main and shift frames for limiting up and down movements of the shift frame, a bellcrank fixed on said rock shaft having a forwardly extending arm and an upwardly extending arm, a spring connected to said upwardly extending arm of the bellcrank and to the main frame for rocking the shaft in one direction, a key lever fulcrumed on the main frame having a rearwardly extending arm provided with a longitudinal slot and also having a forwardly extending arm, a shift key carried by the forwardly extending arm of the key lever, and a horizontal transversely extending stud carried by the forwardly extending arm of the bellcrank and engaged in the slot in the rearwardly extending arm of the key lever.

2,001,760

METHOD AND MACHINE FOR PROCESSING COLLAPSIBLE TUBES

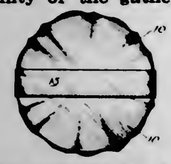
Edwin H. Barker, Moylan, Pa., assignor to A. H. Wirz, Inc., Chester, Pa., a corporation of Pennsylvania

Application August 31, 1931, Serial No. 560,408
20 Claims. (Cl. 113—44)

1. In a machine for treating collapsible tubes, a rotatable head, tube carriers thereon each comprising a sleeve having a bore of two different diameters having a shoulder at the juncture of the two bores, a mandrel surrounding a sleeve and rotatable thereon, a plunger axially movable through the center of the sleeve and having a reduced portion sliding in the reduced bore of the sleeve with a shoulder at the beginning of the reduced portion presented toward the shoulder of the sleeve and a spring within the sleeve, surrounding the reduced portion of the plunger and having opposite ends resting against the two shoulders.

20. The method of freeing a die from the threads of a collapsible tube nipple and from the breast of the tube against which the die has pressed during the threading operation, which consists in drawing the parts of the die away from their threading position at an angle to the axis of the tube, between an angle prependicular to the breast of the tube in the middle of the acting surface of the die and perpendicular to the axis of the tube at the same point.

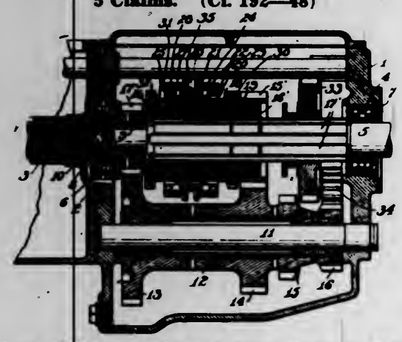
2,001,761



PACKAGING OF LOAF-LIKE BAKERY GOODS

Velma M. Bear, Kansas City, Mo., assignor to Schulze Baking Company, Kansas City, Mo., a corporation of Illinois

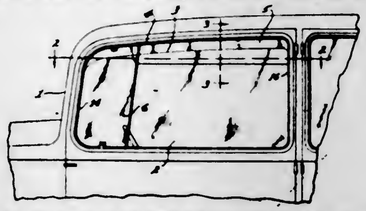
Application July 31, 1933, Serial No. 683,001
1 Claim. (Cl. 229—87)



The combination with a bakery product in loaf-like form having a transparent wrapper of regenerated cellulosic sheet material gathered and folded upon itself at its bottom, of a transparent

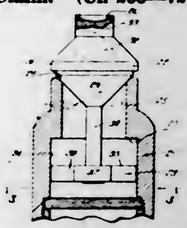
strong and flexible band of regenerated cellulosic sheet material passing completely around the form outside the wrapper where gathered and folded, the ends of the band being adhesively secured directly one to the other and the band being adhesively secured to the wrapper in the immediate vicinity of the gathered and folded

portion of the wrapper, the band being free from adhesion to the wrapper at the sides and top of the form and being of extremely narrow width relatively to the form, whereby the band serves to hold the folds of the wrapper in position and elsewhere on the form serves as a bail while at the same time the form may be seen through the band and wrapper.



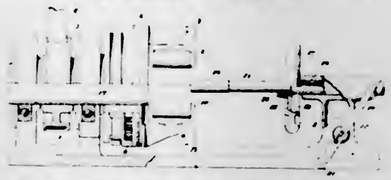
2,001,762
AUTOMOBILE TRANSMISSION MECHANISM
Howard E. Blood, Detroit, Mich., assignor, by mesne assignments, to Free Wheeling Patents Corporation, South Bend, Ind., a corporation of Delaware
Application January 20, 1930, Serial No. 421,937
5 Claims. (Cl. 192—48)

1. A structure adapted for use in a vehicle transmission which includes gear elements, said structure comprising drive and driven members, a normally disconnected one-way clutch unit, and means movable with respect to said one-way clutch unit and with respect to each of said gear elements of the associated transmission for rendering said one-way clutch unit operative to connect said members, said means being also operable to connect said members independently of said one-way clutch unit.



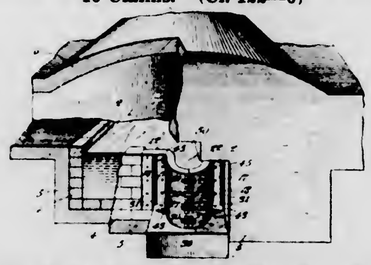
2,001,763
MEANS FOR VENTILATING THE INTERIOR OF AUTOMOBILE BODIES
John M. Benbright, Detroit, Mich.
Application November 27, 1933, Serial No. 699,853
2 Claims. (Cl. 296—44)

2. A ventilating means for use in conjunction with closed automobile bodies having a window opening, comprising the combination with a pair of channel strips mounted in the window opening in side by side relation, a vertically movable glass member for closing the window opening and movable into or out of one channel strip and a transparent shield member secured in the other channel strip and extending below the upper edge of the window opening a comparatively short distance and further extending from the rear vertical side of the opening and terminating at a distance from the forward vertical side thereof, a lug struck downwardly from the channel strip



for the transparent shield member, said lug engaging the forward edge of the transparent shield member and supporting the same in the respective channel strip.

2,001,764
CORE DRILL AND VALVE THEREFOR
Leonard Bradley, Whittier, Calif., assignor to Howard W. Stepp, Whittier, Calif.
Application July 27, 1932, Serial No. 625,145
1 Claim. (Cl. 255—72)



In a core drill on the lower end of a drilling string, having a core receiving barrel open at its lower end, and valve means on the upper end of the barrel operatable to prevent fluid from passing downwardly into the barrel and to permit fluid to pass upwardly out of the barrel, said means including a seat on the upper end of the barrel, a valve member cooperating with said seat to seal therewith, said valve member comprising a stem for guiding the valve member for limited vertical and lateral movement, and a seat in the top of the valve member for receiving a device of the character described lowered in the drilling string.

2,001,765
MANUFACTURE OF HOLLOW ARTICLES FROM PLASTIC MATERIALS
Kurt Bratring, Berlin-Charlottenberg, Germany
Application November 30, 1932, Serial No. 644,942
10 Claims. (Cl. 18—2)

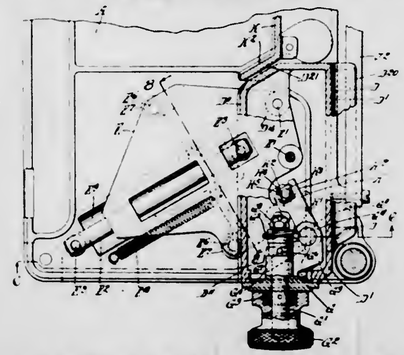
6. In an apparatus of the character described, in combination, a reciprocable member for yieldingly supporting a mold and a molded article carried thereby, a revoluble member carried by a support in turn rotatable substantially axially of said mold, and means for bringing said revoluble member into pressure engagement with said molded article.

2,001,766
GLASS FURNACE
Banks D. Brown, Connellsville, Pa., assignor to Capstan Glass Company, Connellsville, Pa., a corporation of Delaware
Application March 29, 1933, Serial No. 663,265
16 Claims. (Cl. 122—6)

1. In a device of the class described, the combination in a furnace having an opening at one end of a plurality of cooling jackets in vertical alignment with the back wall of the furnace, said jackets fitting into the opening and having a curved part extending outwardly therefrom to provide a chamber for feeding raw materials to the furnace.

2,001,767
OCTYLSALICYLIC ACID
Herman A. Bruson, Germantown, and Otto Stein, Drexel Hill, Pa., assignors to Röhm & Haas Company, Philadelphia, Pa.
No Drawing. Application October 1, 1931, Serial No. 566,314
4 Claims. (Cl. 260—111)

1. In the process for making a secondary octylsalicylic acid the step which comprises condensing salicylic acid with a member of the group consisting of octanol-1 and octanol-2, in the presence of aqueous sulfuric acid of between 70 and 85 percent H_2SO_4 content.

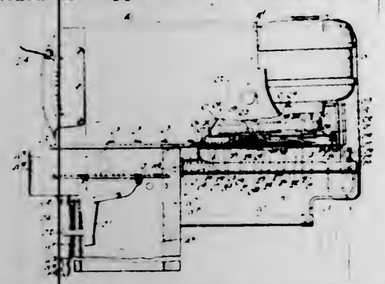


3. A new product, secondary octylsalicylic acid, said product being a crystalline compound insoluble in water which melts when pure at about 120° C.

2,001,768
METHOD AND APPARATUS FOR IMPREGNATING MATERIAL
James H. Campbell, Somerville, Mass., assignor to James D. Moore, Dorchester, Mass.
Application March 15, 1933, Serial No. 660,867
17 Claims. (Cl. 12—1)

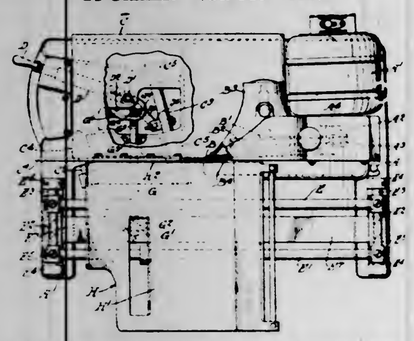
1. The method of treating sheet material comprising irregularly matted animal fibers which comprises arranging substantially imperforate protective material across one surface and about the peripheral edges of the sheet, embedding these edges in the protective material and applying to the other surface of the sheet a liquid comprising an ingredient adapted to increase the utility of the sheet.

2,001,769
SLICING MACHINE
William J. Campbell, Indianapolis, Ind., assignor to American Slicing Machine Company, Chicago, Ill., a corporation of New York
Application February 14, 1931, Serial No. 515,689
2 Claims. (Cl. 146—102)



1. In a slicing machine which includes a base, a knife mounted on said base and means for actuating it, a gauge plate, a work support, and means for guiding said work support across the face of said gauge plate and past the cutting edge of the knife along a path in parallelism with the forward face of the gauge plate, and means for varying the position of the gauge plate, including a gauge plate support, a manual control member mounted thereon and movable therewith and a driving connection adapted, in response to movement of said manual control member, to move the gauge plate support toward or away from the cutting plane, said driving connection including a lever pivoted to said support, a connection between said lever and the base, said lever being rotatable about said connection, and means for rotating said lever in response to movement of said manual control member, and means for permitting longitudinal movement of the lever in relation to its connection with the base, said means including a block rotatable about the axis of connection between the lever and the base, and a sliding connection between said lever and the block.

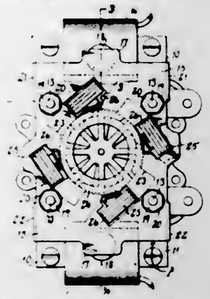
2,001,770
SLICING MACHINE
William J. Campbell, Indianapolis, Ind., assignor to American Slicing Machine Company, Chicago, Ill., a corporation of New York
Application November 2, 1932, Serial No. 640,784
10 Claims. (Cl. 146—102)



1. In a slicing machine including a base, a knife thereon and means for actuating it, and a carriage and means for guiding the carriage past the cutting edge of the knife, a guard plate for the forward face of said knife and a frame portion extending upwardly from said base, adapted to support said guard plate, and means for securing said guard plate on said frame portion, including securing pins adapted to receive

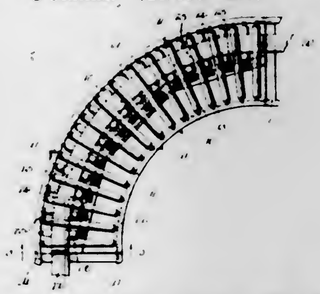
the lower edge of said guard plate, a plurality of plate engaging members on said pins, yielding means for thrusting them together against opposite sides of the plate, said members being provided with opposed bevelled faces adapted to

permit ready penetration of the guard plate therebetween, said bevelled faces being flared widely apart when said plate engaging members are in contact with each other, and additional means for securing the upper edge of the guard plate.



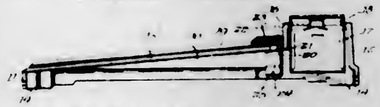
2,001,771
SLICING MACHINE
William J. Campbell, Indianapolis, Ind., assignor to American Slicing Machine Company, Chicago, Ill., a corporation of New York
Application January 15, 1934, Serial No. 706,717
14 Claims. (Cl. 146—102)

1. In a slicing machine, a base, a knife mounted on the base and means for actuating it, a gauge plate and means for actuating it, a carriage and guiding means for guiding said carriage across the face of the gauge plate and past the cutting edge of the knife, and means for varying the distance between the carriage and the cutting plane of the knife in response to movement of the gauge plate.



2,001,772
ALTERNATING CURRENT MOTOR AND THE LIKE
Elof L. Carlson, Bristol, Conn., assignor to The E. Ingraham Company, Bristol, Conn., a corporation
Application December 19, 1933, Serial No. 703,031
5 Claims. (Cl. 172—275)

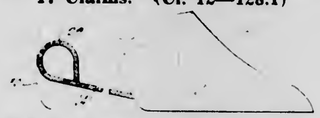
5. In an alternating-current motor, the combination with the rotor thereof; of a stator-structure having two electromagnet-coils located on opposite sides of the said rotor and a pole-member of magnetic material for each of the said coils; and stabilizing-means of non-magnetic material extending between the pole-members



of the respective coils and pressing against both of said coils to stabilize the same.

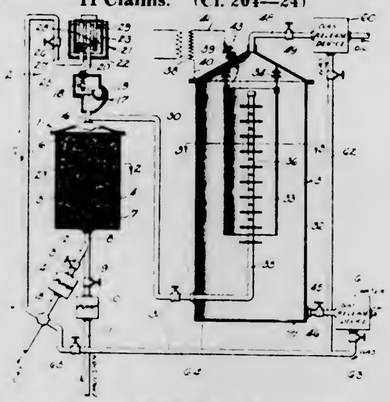
2,001,773
CONVEYER CURVE
Linus R. Collar, Chicago, Ill., assignor, by direct and mesne assignments, to The Lamson Company, Syracuse, N. Y., a corporation of Massachusetts
Application April 8, 1931, Serial No. 528,508
8 Claims. (Cl. 198—127)

5. A curved, live roller conveyer comprising a series of load supporting and transporting live rollers, a belt having flat sides for driving the live rollers, the belt being curved laterally in the direction of its width to follow the curve of the conveyer, and means for holding the belt in flatwise driving engagement throughout its width with the live rollers on the curve.



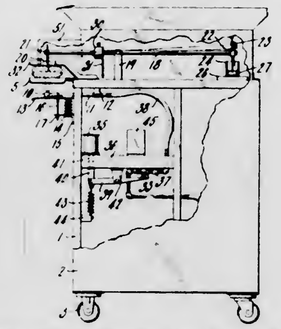
2,001,774
DESK PAD HOLDER
Frank C. Dell, Chicago, Ill., assignor to Autopoint Company, Chicago, Ill., a corporation of Illinois
Application November 27, 1933, Serial No. 699,852
3 Claims. (Cl. 281—44)

1. In a desk pad holder, the combination of an integral frame comprising a head, a pad base and supporting legs, a pad-holding clip extending horizontally over the upper end of the base, a vertical projection from the middle portion of the clip extending downward through the base and terminating in a horizontal shelf, and a spring seated on the shelf and bearing at its upper end against the bottom of the base.



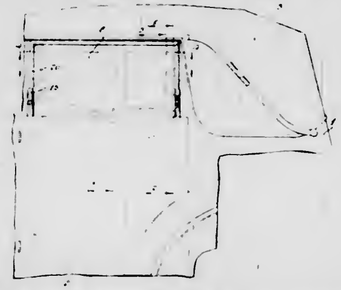
3. In a desk pad holder, the combination of an integral non-metallic frame having a head piece adapted to receive and hold a container, a pad base and supporting legs, said legs having non-circular recesses therein, and resilient feet seated in said recesses, said feet being normally circular in cross section.

2,001,775
SHOE FORM
William J. De Witt, Auburn, N. Y., assignor to Shoe Form Co., Inc., Auburn, N. Y., a corporation of New York
Application January 19, 1933, Serial No. 652,463
17 Claims. (Cl. 12—128.1)



1. A shoe form comprising a hollow toe portion having side walls, a cross brace connecting said walls and consisting of sections movable toward and away from a position of alignment to expand or contract the walls of the toe portion, tongues projecting from the inner end of each cross brace section and having apertures therein and a back part member comprising a wire the forward end of which is passed through the apertures in both said tongues and headed, the headed end of the member acting upon one of said tongues to move the sections positively away from the position of alignment when the member is retracted, and a spring surrounding said wire and bearing against the other tongue to move said sections yieldably toward such position when the member is advanced, the wire moving forwardly through said apertures.

2,001,776
METHOD AND APPARATUS FOR ELECTRICALLY TREATING EMULSIONS
Harold C. Eddy, Los Angeles, Calif., assignor to Petroleum Rectifying Company of California, Los Angeles, Calif., a corporation of California
Application April 18, 1932, Serial No. 605,910
11 Claims. (Cl. 204—24)

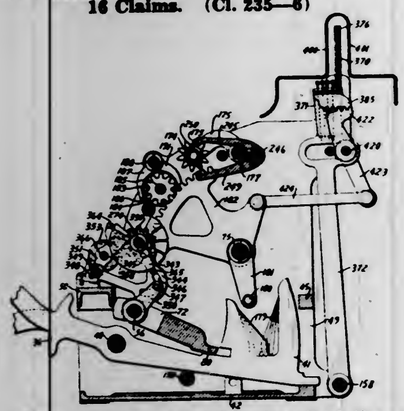


1. A method of dehydrating a viscous and oxidized emulsion, which comprises: simultaneously forcing said emulsion and a gas through a filter material under pressure to alter the surface tension of said emulsion; and subjecting said emulsion to the action of a high potential electric field.

2,001,777
TUBE INFLATING MACHINE
Ernst Eger, Grosse Pointe Park, Mich., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application November 29, 1932, Serial No. 644,790
3 Claims. (Cl. 152—11)

1. Inflating mechanism for an assembled tube and valve stem comprising means for clamping a valve stem, spaced means disposed adjacent to the clamping means for limiting the local inflation of the tube, and means for engaging the tube intermediate the spaced limiting means for controlling the supply of fluid to the tube.

2,001,778
WINDOW ASSEMBLY FOR AN AUTOMOTIVE VEHICLE
Herbert C. Field, Windsor, Ontario, Canada, assignor to Ternstedt Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application March 23, 1933, Serial No. 662,217
4 Claims. (Cl. 296—48)



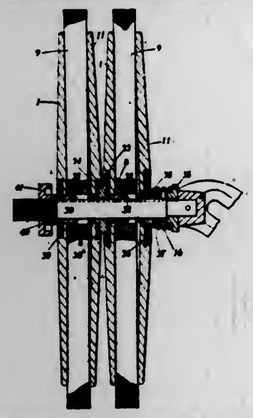
1. A window assembly for an automotive vehicle of the type having an opening and a window well beneath the said opening comprising a window panel for closing the window opening when in raised position and arranged to retreat into the window well, a weatherstrip mounted in the window opening for sealing the edges of the window panel when in raised position, a guide channel for each of the vertical edges of the panel positioned entirely within the window well for guiding the panel below the belt, a flexible lining for the guide channel, a sash for each of the vertical edges of the window, and an extension for the sash projecting beneath the lower edge of the window panel, a cam plate carried by each sash projection, and means mounted in the upper portion of the window well for engaging the cam plate as the window is raised to

closed position for tilting the window inwardly of the window opening into sealing engagement with the weatherstrip.

2,001,779
CASH REGISTER

John P. Frank, Dayton, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland

Original application January 28, 1926, Serial No. 84,250. Divided and this application March 13, 1930, Serial No. 435,456
16 Claims. (Cl. 235—6)

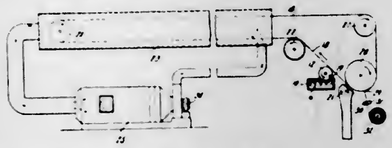


1. In a machine of the class described, the combination of a plurality of lever keys, an actuating member adapted to be differentially operated by said keys, a plurality of rotatable members operated by said actuating member, a plurality of counting devices appropriate to said lever keys, and a plurality of counting device actuating means selectively operated under control of said rotatable members.

2,001,780
MEANS FOR CONTROLLING THE TENSION ON STRIPS OF FLEXIBLE MATERIAL DRAWN FROM FLAT COILS

Francis Henry Fry, Gravesend, England, assignor to W. T. Henley's Telegraph Works Company, Limited, London, England, a British company

Application April 22, 1930, Serial No. 446,286
In Great Britain May 10, 1929
6 Claims. (Cl. 242—75)



4. A device for controlling the tension of strip material as it is being drawn off from a flat coil comprising a coil carrier adapted to make a comparatively close fit with the coil and having two discs between which the coil is adapted to be placed, and one of the discs having a dished inner surface so as to make contact with the coil only at the radially outer part of the latter, and means for applying a gradually reducing lateral pressure to the coil through the discs.

2,001,781
APPARATUS FOR MAKING RUBBER THREAD

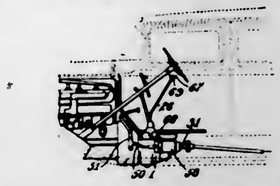
John R. Gammeter, Akron, Ohio, assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application August 6, 1932, Serial No. 627,744
3 Claims. (Cl. 18—15)

1. An apparatus for making strip rubber comprising a travelling liquid impervious surface, a grooved roller for applying a film of rubber-containing fluid thereon, means for drying the rubber film, means for removing the dried film in strip form from the surface, and means for cleaning the bare surface as it advances.

2,001,782
FILLER FOR QUILTS OR THE LIKE

Joseph Goodstein, New York, N. Y.



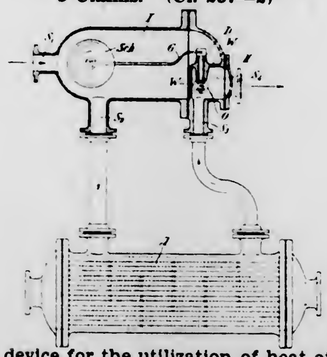
No Drawing. Application November 13, 1934, Serial No. 752,833
4 Claims. (Cl. 19—146)

4. As an article of manufacture, a filler for quilts or coverlets in the form of a defined fluffy and resilient layer incorporating down of birds of the duck family intermingled and interlocked with fibrous material.

2,001,783
FREE WHEELING TRANSMISSION AND CONTROL THEREFOR

Harry J. Heck and John M. Simpson, Muncie, Ind., assignors, by mesne assignments, to Free Wheeling Patents Corporation, South Bend, Ind., a corporation of Delaware

Application November 27, 1931, Serial No. 577,562
19 Claims. (Cl. 192—48)



19. In an automotive vehicle, the combination of a clutch, means movable to release the clutch, a member driven by the clutch, an overrunning drive between the clutch and the driven member, means for locking out the overrunning drive, means interconnecting the clutch-releasing means and the locking-out means, and means controllable at will for rendering the interconnecting means effective and ineffective.

2,001,784
APPARATUS FOR UTILIZING HEAT OF CONDENSATES

Wilhelm Hofmann, Bitterfeld, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

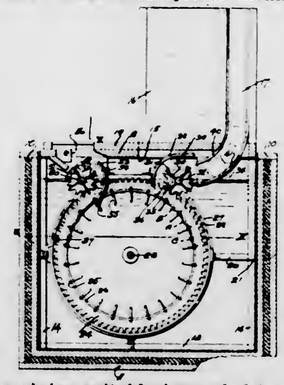
Application March 17, 1934, Serial No. 716,106
In Germany December 12, 1932
3 Claims. (Cl. 257—2)

1. A device for the utilization of heat of waste condensates comprising a vessel for receiving the condensate at its initial pressure, a heat exchanger in pressure communication with said vessel, a pressure check device located at the exit side of the condensate from such heat exchanger adapted to reduce the pressure of said condensate, and means for controlling the flow of said condensate through said pressure check device so as to render it commensurate with the supply of condensate to said receiving vessel.

2,001,785
METHOD OF MAKING INFLATABLE ARTICLES

Victor H. Hurt, Naugatuck, Conn., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application June 29, 1933, Serial No. 678,148
5 Claims. (Cl. 154—2)

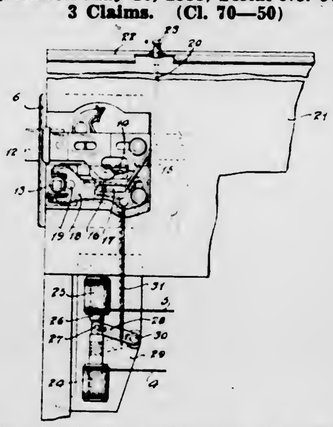


1. A process for making inflatable articles which comprises superposing two sheets of rubber stock, completely cutting out therefrom two superposed segments of the article and simultaneously seaming together a portion of their edges to form one element, repeating said last operation on another portion of superposed stocks to form a second element, opening one of said elements along its free cut edge and inverting it, associating the inverted element with the other one with free cut edges of both elements superposed and substantially in registry, and cut-seaming together the registered cut edges.

2,001,786
BOTTLE DISPENSING APPARATUS

Clyde H. Karnaghan, Memphis, Tenn.

Application March 31, 1934, Serial No. 718,377
3 Claims. (Cl. 312—36)



1. In a bottle dispensing apparatus a cooling chamber, a horizontally disposed shaft journaled therein, a disk having teeth thereon mounted on said shaft, a plurality of spacing fingers disposed at equal intervals along a circle concentric with said shaft, each of said fingers being rigidly secured to said disk and extending outwardly at right angles therefrom and each having a U shaped bend, intermediate its length, extending radially inward, a bracing ring concentric with said shaft rigidly secured to the ends of said fingers, feeder means and ejector means each including a pinion suitably journaled in said casing and having its teeth meshing with the teeth of said disk and each having means forming pockets carried by and extending horizontally outward from its said pinion, a pair of strippers cooperating with said ejector pockets to remove bottles from said drum, one of said strippers being disposed exterior to said bracing ring and the other thereof being disposed in the path of the pockets of the U shaped bends in said fingers, and manual means for actuating said ejector.

2,001,787
LATCH

John W. Lakin, Detroit, Mich., assignor to Ternstedt Manufacturing Company, Detroit, Mich., a corporation of Michigan

Application May 10, 1933, Serial No. 670,254
3 Claims. (Cl. 70—50)

1. In a latch the combination of a retractable latch bolt, an outside retractor for the bolt, means for locking the outside retractor, manually operable means for actuating the first mentioned means and for indicating that the outside re-

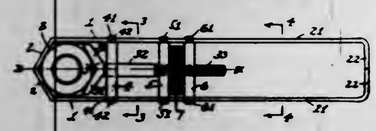
tractor is locked, independent means operatively connected to said manually operable means for actuating both the first mentioned means and the manually operable indicating means, and a control device for controlling the independent means whereby the independent means may be actuated to lock the outside retractor and to set the indicating means.

2,001,788

STABILIZATION OF ALDEHYDE PRODUCTS

Percy Joshua Leaper, Naugatuck, Conn., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application April 20, 1933, Serial No. 667,042
4 Claims. (Cl. 23—250)



1. A process of improving the perfume characteristics of an amyl cinnamic aldehyde as commercially prepared which comprises adding thereto a small amount of diphenylamine.

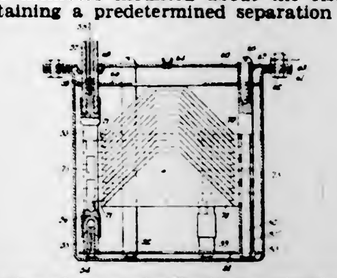
2,001,789

ADJUSTABLE WRENCH

Micheal J. Leaveck, Detroit, Mich.

Application June 14, 1934, Serial No. 730,636
1 Claim. (Cl. 81—175)

As an article of manufacture, an adjustable wrench comprising a frame of substantially U-shape bent up from a single strip of metal of constant thickness throughout, having within the bend thereof one or more flat gripping surfaces and having its free ends turned inwards and abutting one upon the other to form a handle, a jaw positioned within said frame and movable longitudinally thereof having one or more flat gripping surfaces adapted to co-act with the gripping surface or surfaces upon the frame and having a square shank terminating in a screw threaded tail-piece, there being clearance spaces between said jaw and the adjacent inner surfaces of the frame, a transverse member within said frame having a square opening to slidably receive the said shank and having journaled portions secured within openings in the frame, a pair of transverse members within said frame arranged in parallel spaced relation having circular openings to slidably receive the said tail-piece and having journaled portions secured within openings in the frame, and a nut positioned between said last-mentioned transverse members and engaging said tail-piece.



2,001,790

ASYMMETRIC CONDENSER AND METHOD OF OPERATING THE SAME

Julius Edgar Lilienfeld, Winchester, Mass.

Application April 22, 1931, Serial No. 531,901
7 Claims. (Cl. 175—315)

1. In an electrolytic condenser including a container for electrolyte: a stack of spaced frustoconical electrode plates immersed in the electrolyte and having perforated basal ears for mounting the plates within the container, conducting risers fitting through the perforations of the ears and connecting the plates together, and skeleton spacer members mounted about the risers for maintaining a predetermined separation of the

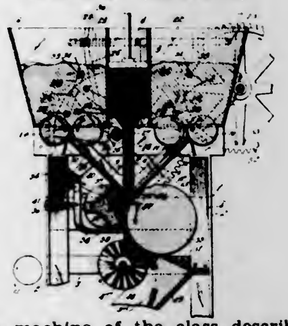
respective plates and affording a circulation of the electrolyte therethrough.

2,001,791

PROCESS FOR TREATING LATEX AND PRODUCT OBTAINED THEREBY

Chester E. Linscott, Saugus, Mass., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application October 20, 1933, Serial No. 694,521
11 Claims. (Cl. 18—50)



1. A stable concentrated latex composition capable of producing a dried rubber film substantially free of water-soluble ingredients comprising a creamed latex containing a soap of a volatile base and a soap-forming acid, and a volatile resin solvent which is substantially a non-solvent of rubber.

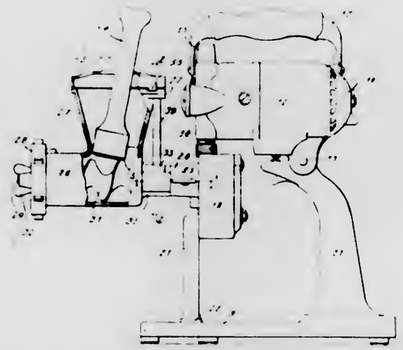
2,001,792

RAVIOLI MACHINE

Louis G. Lombi, Teaneck, N. J.

Application June 14, 1934, Serial No. 730,637
11 Claims. (Cl. 107—1)

1. In a machine of the class described, the combination with a dough supplying hopper, and dough sheeting means including cooperating rolls, of means for forcing dough between said rolls and operative in conjunction with one of said rolls to sever the dough against said roll from the supply in said hopper.



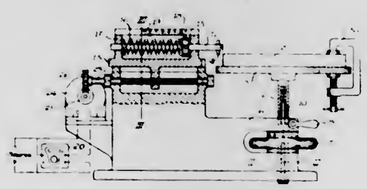
2,001,793

SAFETY DEVICE FOR FOOD CHOPPERS AND THE LIKE

Michael W. McArdle and Ivar Jeppsson, Chicago, Ill., assignors to Chicago Flexible Shaft Company, Chicago, Ill., a corporation of Illinois

Application May 10, 1933, Serial No. 670,320
8 Claims. (Cl. 192—135)

1. In a kitchen appliance, the combination of food working means, a hopper adapted to continuously supply material to said means, continuously operating power means during the operation of the food working means for operating said food working means including clutch means for connecting and disconnecting the drive between the power means and food working means, a guard arranged in a closed position to cover the mouth of said hopper and prevent the operator extending his fingers through the hopper



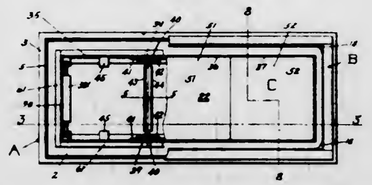
and into contact with said food working means, the guard being movable back and forth between said closed position and an open position, and means operated by the guard for engaging said clutch means when the guard is moved to its closed position and for disengaging said clutch means to temporarily disconnect the food working means from said continuously operating power means when moved to said open position.

2,001,794

APPARATUS AND METHOD OF DETERMINING THE TENACITY OF BONDED GRANULAR BODIES

Romie Lee Melton, Niagara Falls, N. Y., assignor to The Carborundum Company, Niagara Falls, N. Y., a corporation of Pennsylvania

Application April 30, 1930, Serial No. 448,552
6 Claims. (Cl. 265—18)



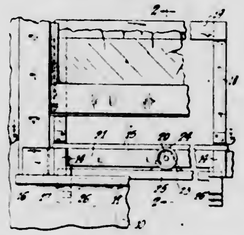
5. Apparatus for measuring the tenacity of bonded granular articles comprising a support adjustable to permit moving the article to be tested in a predetermined direction, means for moving a gouging tool to cut a groove in said article to a predetermined depth and along a non-repeating path, said means comprising a driven shaft provided with a worm, a carriage slidably mounted in a frame and having a threaded connection with said worm shaft, a tool carrier slidably mounted in said carriage and means for measuring the force required to move said tool.

2,001,795

COLLAPSIBLE MOLD FOR CONCRETE BURIAL VAULTS

William A. Palmer, Muhlenberg Township, Berks County, Pa.; Willard S. Palmer, administrator of said William A. Palmer, deceased, assignor to Mary L. Palmer

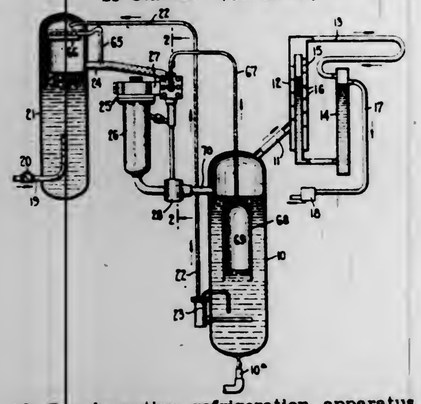
Application March 17, 1934, Serial No. 716,043
6 Claims. (Cl. 25—130)



1. A collapsible mold for concrete burial vaults and the like, comprising pallet, casing, and core sections; said pallet having parallel spaced flanges forming continuous rigid supports for the contacting edge portions respectively of the casing and core sections; said casing having upstanding sides and ends, engaging corner edges, and tie rods uniting said sides to said ends; and said core having its sides and top formed of a plurality of plates with abutting meeting edges, a transverse bracing plate extending from the abutting edges of two plates on one side to the abutting edges of two plates on the opposite side, complementary means on said bracing and side plates slidably engageable to rigidly lock said side plates in edge abutting relation to said bracing plate, and supporting means on the top edge of said bracing plate for the meeting edges of two adjoining top plates.

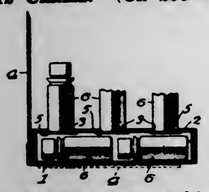
2,001,796

ADJUSTABLE WINDOW SEAT



Nickolaus Paulus, Brooklyn, N. Y.

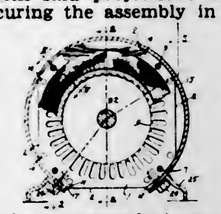
Application January 23, 1934, Serial No. 707,911
1 Claim. (Cl. 304—24)



A window seat comprising a seat panel, beams mounted substantially peripherally along the lower edges of said panel and supporting the panel, ears hingedly attached to the front ends of the side beams adapted to lie against the inner window frame to support said seat from within, a shaft rotatably mounted under said panel between the front and rear beams, said shaft being threaded, a threaded block engaging said shaft between said front and rear beams and extending downward therefrom, and a support extending downward from said block having its inner wall formed in inverted step-like shape, said seat being secured in place by rotation of said shaft to cause said support to clamp the seat between said ears and said support, said support engaging the edge of the outer sill.

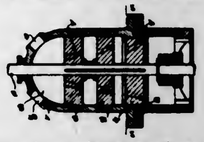
2,001,797
REFRIGERATION
Eric H. Ryden, New York, N. Y., assignor to Electrolux Servel Corporation, New York, N. Y., a corporation of Delaware
Application February 2, 1932, Serial No. 590,379
15 Claims. (Cl. 62—5)

10. In absorption refrigeration apparatus, a generator, an absorber, means including an intermediate vessel for transferring absorption solution from said absorber to said generator, and means for controlling the operation of said transfer means responsive to temperature in the upper part of said vessel.



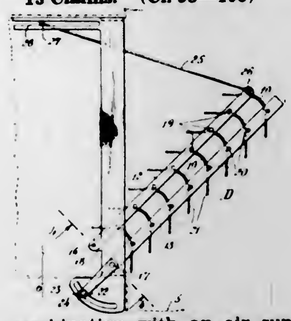
2,001,798
DISPLAY DEVICE
Louis H. Schreiber, Chicago, Ill., assignor of one-half to Mortimer S. North, Chicago, Ill.
Application April 10, 1933, Serial No. 665,268
12 Claims. (Cl. 206—44)

1. In a display device, the combination of a support, means forming adhesive spots arranged in fixed relation to each other on said support, forming predetermined definite positions for the articles to be displayed, with a raised non-adhesive surface between said spots, and articles for sale held in display position by said adhesive, the latter being practically non-drying in character, whereby when an article is removed and sold, another one may be put in its place.



2,001,799
ELECTRIC MOTOR
Arthur W. Seyfried, Cleveland Heights, Ohio, assignor to The Apex Electrical Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application August 5, 1931, Serial No. 555,192
9 Claims. (Cl. 172—36)

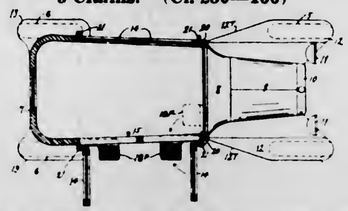
1. Process of making dynamo electric machines with laminated stators, characterized by forming the stator punchings each with a single projection on its outer periphery, assembling said punchings with said projections in a straight line, and securing the assembly in an external



member which is arranged at one side to provide a stop for said projections.

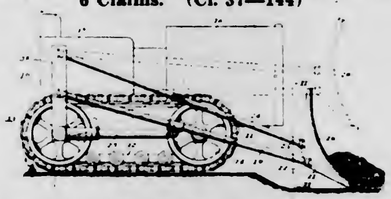
2,001,800
ROTOR FOR ROTARY ENGINES
Eugen Silbermann, Oradeamare, Rumania, assignor to Explorotor A. G., Glarus, Switzerland, a corporation of Switzerland
Application April 16, 1931, Serial No. 530,467
In Switzerland April 22, 1930
5 Claims. (Cl. 253—32)

1. In a rotor for rotary engines in which the propelling medium operates intermittently, channels for the passage of a propelling medium the longitudinal axis of each of which channels follows a continuous three-dimensional curve substantially coincident with a geodetic line on a surface of rotation of the second degree the generatrix of which is a curve of the second degree and conforming to the path of flow taken by the said medium when considered merely as moving forwards with a velocity determined by given running conditions of the engine and at the same time travelling round the middle axis of the rotor with a velocity determined by the given normal speed of the engine.



2,001,801
AIR DISTRIBUTION
Horace L. Smith, Jr., Richmond, Va., assignor to Thermal Engineering Corporation, Richmond, Va., a corporation of Virginia
Application September 17, 1934, Serial No. 744,302
13 Claims. (Cl. 98—106)

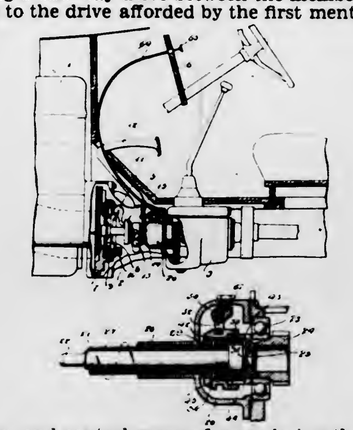
1. The combination with an air supply duct and a branch duct connected at an angle thereto, of a deflector damper device for controlling the flow of air from said supply duct to said branch duct comprising a plurality of elongated spaced



vanes disposed lengthwise transversely of said ducts and in parallel relationship at an angle to the axes of both of said ducts, supporting means for said vanes pivoted at one edge of said branch duct, pivotal connections between each of said vanes and said supporting means, means for moving said supporting means to adjusted positions in and at least partially across said air supply duct and means acting upon movement of said supporting means about its pivot and as the result of said movement to turn said vanes continuously with respect to said supporting means to maintain the transverse directions of said vanes parallel to their original positions at all adjusted positions of said supporting means.

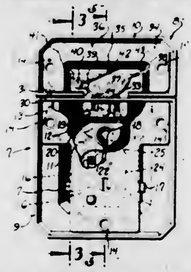
2,001,802
COMBINATION DOORSTEP
George F. Spettel, St. Paul, Minn.
Application November 19, 1934, Serial No. 753,690
5 Claims. (Cl. 280—166)

4. A disappearing door step device for doors of the class described, said device comprising a lower door hinge member, an arm integral with said hinge and extending radially therefrom, a step-plate formed integral with said arm in horizontal plane and exposed outwardly of and below the door opening when the door is open and retracted under the door opening by the closing of the door.



2,001,803
EARTH HANDLING DEVICE
William T. Stephens, Youngstown, Ohio, assignor to The Commercial Shearing & Stamping Company, Youngstown, Ohio, a corporation of Ohio
Application April 12, 1933, Serial No. 665,721
6 Claims. (Cl. 37—144)

1. The combination with a tractor having a chassis with a track frame and tread belts thereon, of pusher beams pivoted to said frame, a bulldozer blade pivotally supported in front of said tractor on said beams, a link pivoted to the blade and to a fixed pivot effective to vary the angular position of the blade relative to the horizontal on angular movement of said beams, and a hydraulic jack pivoted to the chassis and to one of said beams.

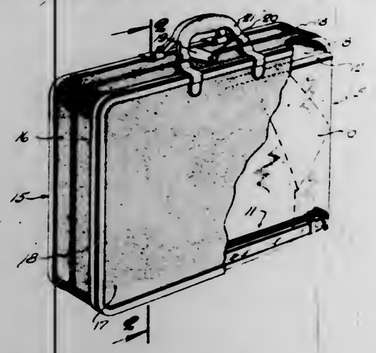


2,001,804
OVERRUNNING DRIVE CONSTRUCTION
Ernest E. Wemp, Detroit, Mich.
Application July 8, 1931, Serial No. 549,545
17 Claims. (Cl. 192—48)

1. In an overrunning drive, the combination of driving and driven members, a coil spring for frictionally establishing a one-way drive between the members, and another coil spring for establishing a one-way drive between the members reverse to the drive afforded by the first mentioned

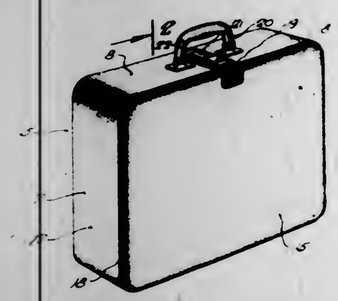
spring, and control means for rendering the second named spring only effective and ineffective at will.

2,001,805
LATCH LOCK
George Henry Wheary, Racine, Wis., assignor to Wheary Trunk Company, Racine, Wis., a corporation of Wisconsin
Application May 14, 1934, Serial No. 725,448
10 Claims. (Cl. 70—2)



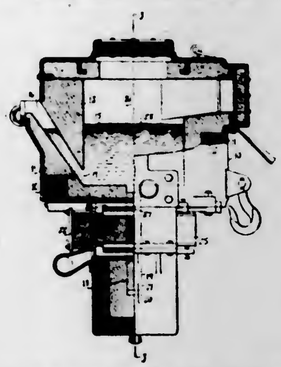
1. In a latch lock of the character described, two complementary sections adapted to be attached to two parts to be secured together, said sections having stamped metal covers arranged to abut each other, a spring carried by one section and engageable with the other to yieldingly urge the sections apart, a latch bolt disposed within the stamped cover of one section, and a keeper carried by the other section for engagement with the latch bolt to hold the sections together against the action of said spring, said keeper being an integral part of a hardened metal plate secured in the cover of said other section, and having parts thereof on different planes so as to afford a shoulder against which the spring abuts.

2,001,806
HAND LUGGAGE
George Henry Wheary, Racine, Wis., assignor to Wheary Trunk Company, Racine, Wis., a corporation of Wisconsin
Application July 5, 1934, Serial No. 733,822
11 Claims. (Cl. 190—41)



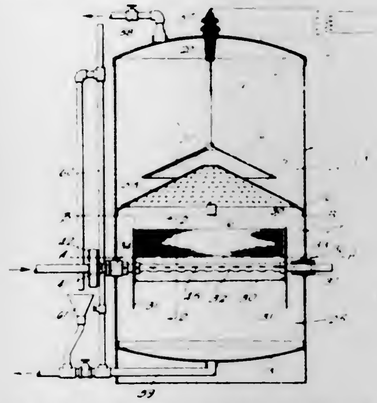
1. Hand luggage of the character described, comprising a solid walled box having a hinged

cover, means on said cover to carry garments in neatly folded arrangement with part of the garments on the outside of the cover, an envelope of flexible material enclosing said box and holding the portions of the garments on the exterior



of the cover against shifting, said envelope comprising complementary sections permanently connected along one edge, and continuous interlocking fastening means to connect the sections along their other meeting edges.

2,001,807
HAND LUGGAGE
George Henry Wheary, Racine, Wis., assignor to Wheary Trunk Company, Racine, Wis., a corporation of Wisconsin
Application July 5, 1934, Serial No. 733,823
6 Claims. (Cl. 190—41)



1. Hand luggage of the character described, comprising a solid walled box having one open side and a hinged cover disposed over said open side, means on said cover to carry garments in neatly folded arrangement with part of the garments on the outside of the cover, a flexible apron to close the open side of the box and hold the portions of the garments on the exterior of the box cover flat against the cover, an outer surfacing of material similar to that of which the apron is made permanently fixed to the walls of the box, means permanently attaching one edge of the apron to the box, and continuous interlocking fastening means to secure the remaining edges of the flexible apron to the box, said interlocking fastening means comprising two cooperating parts one of which is permanently fixed to said remaining edges of the apron and the other of which is permanently fixed to the outer surfacing adjacent the periphery of the open side.

2,001,808
FURNACE FOR PRODUCING PURIFIED METALS
Maurice L. Wood, Waterbury, Conn., assignor to The Chase Companies, Incorporated, Waterbury, Conn., a corporation
Application August 28, 1933, Serial No. 687,023
2 Claims. (Cl. 13—29)

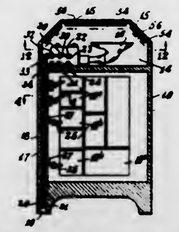
1. A furnace for producing purified copper, copper alloys or the like comprising: a main chamber for holding a quantity of molten metal; a leg chamber of relatively-small cross-sectional area communicating with the bottom of said main chamber and extending downwardly therefrom; means for heating metal in said leg chamber; and a pouring spout communicating with said main chamber only adjacent the bottom thereof and well away to one side from the vertical planes enclosing said downwardly-extending leg-chamber.

2,001,809
METHOD AND APPARATUS FOR SETTLING
John T. Worthington, Long Beach, Calif., assignor to Petroleum Rectifying Company of California, Los Angeles, Calif., a corporation of California
Application April 19, 1932, Serial No. 606,129
13 Claims. (Cl. 204—24)

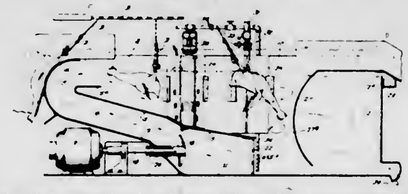
1. A method of separating the constituents of a petroleum mixture, which method includes the steps of: settling said mixture to form bodies of oil and water with a body of loose emulsion therebetween; and mechanically selectively agitating said body of loose emulsion and said body of water without material agitation of said body of oil.

2,001,810
ONE WAY BRAKE
Adolph Zwald, Torrance, Calif.
Application December 1, 1931, Serial No. 578,299
5 Claims. (Cl. 188—81)

1. A one way brake comprising a stationary case, a shaft journaled in said case, a disc secured to said shaft, a drag plate journaled in said case, a ratchet sleeve journaled in the case, a plurality of dogs pivotally mounted on said drag plate, means coupling said dogs to said disc, and means releasably securing said ratchet sleeve to the case.



2,001,811
SLIT-BALL GAME
Theodore J. Berning, Dayton, and Melvin P. Hoover, near Dayton, Ohio
Application October 26, 1934, Serial No. 750,176
3 Claims. (Cl. 273—95)

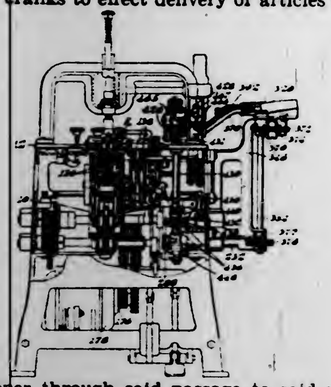


1. In a game, a game board comprising a base, sides, and a concave back member, a series of transverse members mounted between said sides, a sufficient distance above the base and from the back member to permit the free passage of a ball around the innermost transverse member, and balls having slits of a size to receive said transverse members and to permit the balls to rest thereon, said slit balls adapted to be thrown under said transverse members against the back member for a rebound movement from the latter over said members, the latter being spaced a sufficient distance apart to permit the ball to descend upon any one of them with its slit portion straddling the same.

2,001,812
ALARM DEVICE FOR SAFES
Angelo Biasi, Hazleton, Pa.,
Refile for abandoned application Serial No. 113,659, June 4, 1926. This application April 25, 1933, Serial No. 667,770
5 Claims. (Cl. 177—316)

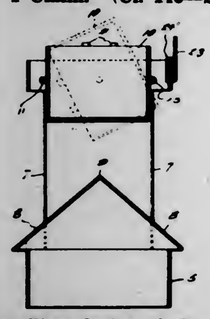
1. A device of the class described, a safe with a compartment separated from the outside atmosphere by a wall having a plurality of openings connecting the interior with the atmosphere, an acoustic alarm within said compartment, flat elements movably mounted upon the inner side of said wall and having projections engaging into said openings in closed positions for closing the openings and having openings out of line with said projections, means for normally urging said flat elements into closed positions, means for operating said alarm, and means for moving said flat elements from closed positions so that the sound of the alarm may pass through the openings in the flat elements and wall.

2,001,813
MECHANISM AND METHOD FOR SCALDING FOWLS
Bohumil Bouda, Clinton, Iowa, assignor to The Collis Company, Clinton, Iowa, a corporation of Iowa
Application August 20, 1932, Serial No. 629,656
8 Claims. (Cl. 17—11)



6. The method of scalding fowls comprising suspending and transporting the fowls through a body of hot water, the water flowing in the direction taken by the fowls, directing the water flow downwardly at the point where the fowls enter the water so as to assist in immersing the fowls, and swirling the body of water so as to raise the feathers of the fowls to insure wetting the skins of the fowls.

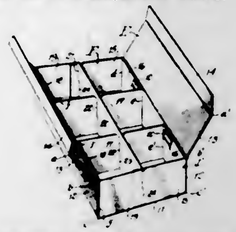
2,001,814
ARTICLE TRANSFERRING MECHANISM
Ira C. Buckminster, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Original application December 10, 1930, Serial No. 501,345. Divided and this application July 7, 1933, Serial No. 679,409
22 Claims. (Cl. 29—60)



1. Article transferring mechanism having, in combination, a hopper arranged with its bottom inclined to the horizontal and having an exit passage in its lower wall, two separated, low cross-ribs on said bottom with their ends overlapping a line extending downward along the bottom to said passage, a stationary finger extending to a point above the said bottom and between said ribs and said passage, a normally stationary raceway, a yielding guideway between said passage and said raceway, a frame to which the hopper is secured with means having provision for adjustment to vary the angle of inclination of said bottom, a stationary, flat support on which the frame is slidable, two cranks connected to the frame and movable about parallel, vertical axes, the connections for one crank including a

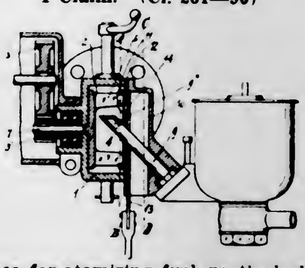
sliding block, and driving mechanism for rotating said cranks to effect delivery of articles from

said hopper through said passage to said raceway.



2,001,815
KITCHEN UTENSIL
Melburn Clark and Thomas J. Callan, Vallejo, Calif.
Application November 4, 1933, Serial No. 696,639½
1 Claim. (Cl. 146—2)

An egg handling device of the character described comprising an upstanding casing having openings in a pair of opposed side portions, chutes extending through the said openings to merge together in the casing, and a rotatable receptacle mounted within the upper portion of the casing, said receptacle being adapted to be tilted to discharge its contents onto one or the other of the said chutes, said receptacle being provided with a yoke having pintle extensions for disposition through the side wall of the casing, one of the said pintles being equipped with a crank handle, an upstanding hinge plate secured to one of the said pintles, and a separator plate hingedly connected at one end to the said hinge plate and adapted for disposition across the top of the receptacle so as to permit only the discharge of egg white when the receptacle is tilted.

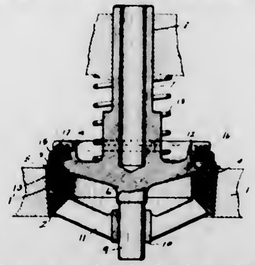


2,001,816
FILLER PACKAGE
Joseph L. Coyle, London, Ontario, Canada, assignor to Leon Benoit, New York, N. Y.
Application November 29, 1933, Serial No. 698,910
4 Claims. (Cl. 229—29)

2. An elongated one-piece filler produced from a strip which is transversely scored and slotted to provide a longitudinally extending central partition intersected by cross partitions at equal distances apart, two of the adjacent cross partitions forming a group connected by walls remote from the central partition and parallel therewith to provide a pair of four-sided enclosures and the cross walls in adjacent groups providing between them a pair of three-sided enclosures open opposite the central partition, the several enclosures defining cells all of which are disposed in two adjacent rows.

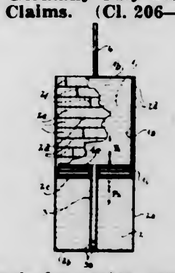
4. In combination, a filler having transverse partitions and outside walls with slots therein, and an open-ended enclosure for the filler provided with integral locking means extended through the wall slots of the filler for edge engagement with a transverse partition thereof.

2,001,817
ATOMIZING DEVICE
Richard Emil Delling, Erfenschlag, near Chemnitz, Germany, assignor of one-half to Emil Freytag, Zwickau, Germany
Application October 12, 1933, Serial No. 693,325
In Germany April 6, 1932
1 Claim. (Cl. 261—90)



A device for atomizing fuel, particularly crude oil, in an internal combustion engine, comprising a casing, an atomizer wheel having a hollow inner space and being rotatably disposed in said casing, a plurality of obliquely arranged ribs with intervening air gaps forming the wall of said wheel, said air gaps extending obliquely to the axial direction of said atomizer wheel, knife-like edges facing the hollow inner space of said wheel and forming part of said ribs, a nozzle so formed as to produce a mist at its mouth, and disposed to deliver said mist to said wheel and thus to the combustion space, the mouth of said nozzle being disposed obliquely to the axis of said wheel and extending into the inner space thereof in the direction towards said ribs, and means for regulating the air supply to the inner hollow space of said wheel.

2,001,818
VALVE MECHANISM
Oswald Duda, Corsicana, Tex., assignor to American Well & Prospecting Company, Corsicana, Tex., a corporation of Texas
Application June 30, 1932, Serial No. 620,122
2 Claims. (Cl. 251—144)



1. In a valve mechanism a valve having an annular groove therearound, a resilient packing ring

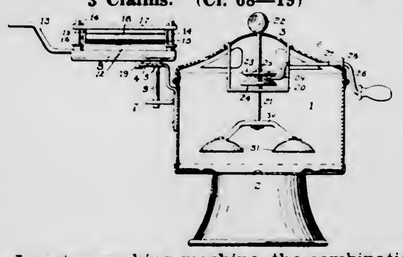
in said groove having a free margin which extends beyond the valve proper and having its inner margin thicker than said free margin, one wall of said groove having an annular half round

recess and an annular lock ring placed in said recess and surrounding said thickened margin and pressing into the material of the packing ring to lock said packing ring in place.

2,001,819
RECEPTACLE FOR PASTES
Eugen Elle and Max Wetzler, Frankfort-on-the-Main, Germany, assignors to Rudi Wetzler, New York, N. Y.
Application July 14, 1934, Serial No. 735,170
In Germany July 26, 1933
6 Claims. (Cl. 206—56)

1. A receptacle for pastes, comprising in combination two telescopic parts, partitions separating said parts, and a riser tube extending through said partitions and establishing connection between said parts.

2,001,820
DISPLAY CASE
Ellison S. Irelan and Roy J. Krabbe, Elgin, Ill., assignors to Illinois Watch Case Company, Elgin, Ill., a corporation of Illinois
Application May 29, 1934, Serial No. 728,116
1 Claim. (Cl. 206—44)

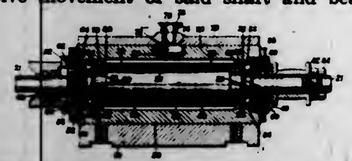


A display case in which is comprised a back having a marginal flange, a bezel provided with an offset flange which is extended in part over the edge and outer sides of the back flange for engagement therewith, a panel plate mounted in and carried by the bezel, the panel plate having a recess extending inwardly of the case to form a pocket for the accommodation of an article therein, a cover having a marginal flange which is fitted over a portion of the offset flange of the bezel for engagement therewith, and means extended angularly from the back forming a support for the case when the latter is stood upon one edge.

2,001,821
SHOE
Joseph H. Everston, Milwaukee, Wis.
Application November 23, 1933, Serial No. 699,319
3 Claims. (Cl. 36—28)

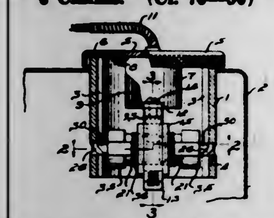
2. In a shoe, the combination with an insole and outsole having a space therebetween, of a relatively inelastic body in said space beneath the arch portion of the wearer's foot at the inside of the shoe, a second relatively inelastic body at the forward end of the shoe beyond the position normally occupied by the wearer's foot, and a relatively elastic body filling the entire remainder of the space between said soles and extending around said first mentioned body at the outside of the shoe.

2,001,822
TOY WASHING MACHINE
Frank J. Goriup, McKees Rocks, Pa., assignor to Wolverine Supply and Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application March 16, 1933, Serial No. 661,038
3 Claims. (Cl. 68—19)



1. In a toy washing machine, the combination with a tub and a lid for said tub, of a frame carried by said lid, a driving shaft extending into said frame and provided at its outer end with a handle and at its inner end with a crank, a substantially vertically disposed driven shaft slidably extending upwardly into the frame, suction cup mechanism carried by the driven shaft, a disk mounted on the driven shaft and riding on the crank, and projections on said disk arranged to be engaged by the crank when the latter is rotated whereby the rotation of said driving shaft imparts both a longitudinal reciprocating movement and a rotary movement to the driven shaft.

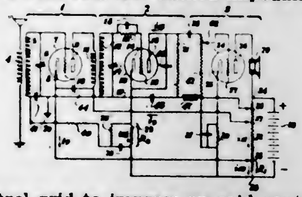
2,001,823
LUBRICATION OF BEARINGS
Norwood H. Knowlton, Rockport, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application January 29, 1931, Serial No. 512,083
14 Claims. (Cl. 308—121)



13. A device of the class described having, in combination, a casing, a shaft extending within the casing, rolling bearings for said shaft spaced apart from each other, a reservoir between said

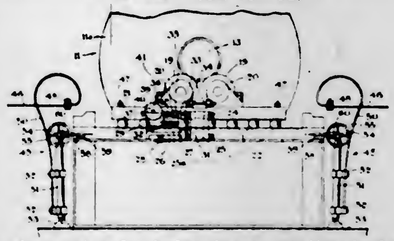
bearings having free access to each of said bearings for supplying excessive quantities of lubricant to said bearings during an initial period of relative movement of said shaft and bearings,

and means positioned between said bearings for absorbing lubricant thrown from the bearings upon continued relative movement of the shaft and the casing.



2,001,824
LOCK
George Maierle, Detroit, Mich.
Application December 22, 1933, Serial No. 703,588
6 Claims. (Cl. 70—50)

1. In a lock, a stationary sleeve provided with guide grooves, a cap arranged to fit over the stationary sleeve, an electro-magnet carried by the cap, a guide frame secured to the electro-magnet, a lock block slidably mounted in the guide frame, a pair of sleeves carried by the lock block, a pair of guide members slidably mounted in the sleeves and riding in the guide grooves of the stationary sleeve, a tube slidably mounted in each sleeve, a pair of spring pressed lock pins within the tubes, the stationary sleeve being provided with apertures to receive the lock pins, a lock member extending between the ends of the lock pins and normally preventing retraction of the lock pins, the lock member being retractable by energization of the electro-magnet to allow withdrawal of the lock pins from the stationary sleeve apertures.

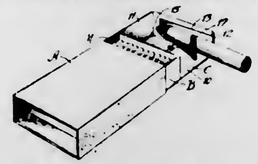


2,001,825
AUTOMATIC VOLUME CONTROL
James R. Nelson, Cambridge, Mass., assignor to Raytheon Production Corporation, Newton, Mass., a corporation of Delaware
Application May 27, 1931, Serial No. 540,276
6 Claims. (Cl. 250—20)

1. A carrier wave device, including a radio-frequency amplifier having a tube containing a cathode, an anode, and a control grid, a detector, means for causing the output of said detector to decrease with an increase in the modulation component and in the strength of the the carrier wave, a source of potential for said receiver, a voltage-dividing impedance across said source, said amplifier and detector being connected to said voltage-dividing impedance so that the output of said amplifier and detector flow through portions of said voltage-dividing impedance, an additional impedance in the output of said detector, said additional impedance being connected to said voltage-dividing impedance to obtain a regulating voltage which is the difference between the drop across a portion of said voltage-dividing impedance and said additional impedance, and means associated with said last-named impedances and

said control grid to impress on said control grid a negative bias which increases with an increase in the strength of the carrier wave only above a certain predetermined strength.

2,001,826
MACHINE FOR BALANCING HEAVY BODIES
Andrew N. Russell and Hans Ulmann, Montreal, Quebec, Canada, assignors to Dominion Engineering Works Limited, Lachine, Quebec, Canada
Application May 18, 1932, Serial No. 612,126
2 Claims. (Cl. 73—51)



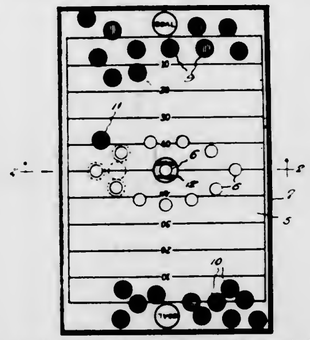
1. Apparatus for balancing a rotating body so that the amount and location of dynamic unbalance existing in said body may be determined without changing the position of the body during the balancing operation, said apparatus comprising a pair of bearing members for rotatably supporting the ends of said body, a support on which each bearing member is mounted to move in a horizontal plane, said bearing members being normally free of springs or other restraining means tending to resist such movement, means for temporarily pivoting each bearing member in turn to its respective support to provide a vertical axis about which the companion bearing member and the body being balanced is free to oscillate, a pair of upright plate springs arranged in the path of and at opposite sides of each bearing member and means for detachably connecting the upper ends of said springs to said bearing member to form an oscillating system of a predetermined frequency, said means comprising flat bars pivoted to the upper ends of the springs.

2,001,827
CIGARETTE HOLDER
Howard P. Thayer, Evanston, Ill.
Application April 27, 1934, Serial No. 722,688
5 Claims. (Cl. 206—38)

1. In combination with a match box which comprises a sliding tray within an open-ended tube, a cigarette holder formed of sheet metal bent to provide three connected walls of which two are adapted to fit slidingly between the tray and tube whereby the third wall may be moved within the tube against the tray end or be pulled outwardly therefrom, a spring arm proximate to

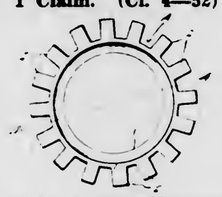
the third wall cooperating therewith to furnish a rest for a cigarette, and a finger extended laterally from the arm to lie transversely of the

rested cigarette adapted to snuff the lighted end thereof when consumed to a point opposite said finger.



2,001,828
ODOR ELIMINATING DEVICE
Earle S. Smith, Toledo, Ohio, assignor to The Toledo Porcelain Enamel Products Company, Toledo, Ohio, a corporation of Ohio
Application December 14, 1932, Serial No. 647,117
1 Claim. (Cl. 183—4)

In an odor eliminating device, in combination, a hollow cartridge having an imperforate outer wall, said cartridge having at its opposite ends openings adapted to be corked to constitute the device an airtight container, whereby it may be handled and stored without deterioration of its contents, a mesh walled tunnel connecting said openings, said imperforate outer wall and said mesh walled tunnel together defining an annular chamber, said annular chamber being charged with activated carbon, and means for suspending said cartridge from two supports, said suspending means being so constructed that when such supports are at approximately the same level said cartridge is supported with said mesh walled tunnel inclined to facilitate passage therethrough of convection currents of air to be purified, the ends of said cartridge being provided with annular flanges of frusto-conical shape which surround said openings and extend into said mesh walled tunnel to prevent such particles of carbon as may sift into said tunnel from rolling or sliding through the lower of said openings when said cartridge is supported with said tunnel in sloping position.



2,001,829
GAME APPARATUS
Harry W. Standidge, Chicago, Ill.
Application October 13, 1933, Serial No. 693,504
6 Claims. (Cl. 273—94)

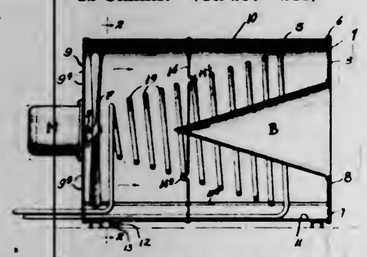
4. In a game, the combination of a playing field bounded by walls to retain playing elements thereon and having openings extending wholly or partially therethrough, and a plurality of visually distinguished groups of spherical playing elements adapted to be moved by gravity upon and over said field upon tilting thereof to effect predetermined lodgment of playing elements in said openings, the diameter of each of such openings being more than one-third and less than two-thirds of the diameter of each of said playing elements, and said openings being so positioned that each and all of the corners and edges of said field are free from any of said openings and so that the space between each of said openings and the ends or sides of said field is sufficient for one or more of said unlodged playing elements to be rolled

therein and against a playing element lodged in any of said openings with sufficient force to dislodge said playing element therefrom in the manner and substantially as described.

2,001,830
REPAIR VALVE SEAT
James Weir, Canton, Ill.
Application September 5, 1934, Serial No. 742,780
1 Claim. (Cl. 4—52)

A repair seat for a worn valve seat which flares upwardly and outwardly, comprising a ring-shaped member sloping downwardly and inwardly from its upper edge to its lower edge for contacting the inner face of the upper portion of the worn valve seat and outwardly extending tongues on the upper edge of the repair seat adapted to be bent over the upper edge of an old seat to hold the new seat on the said old seat.

2,001,831
TIME INDICATING SYSTEM
Emil N. Anderson, Oak Park, Ill., assignor to American Telephone and Telegraph Company, a corporation of New York
Application May 17, 1932, Serial No. 611,907
15 Claims. (Cl. 161—19)



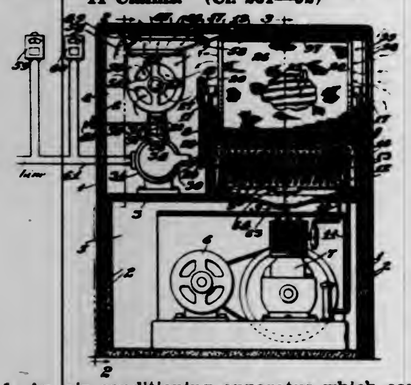
1. In combination, a motor, a plurality of rotatable elements, a common driving shaft rotated by said motor and adapted to rotate said rotatable elements, means individual to each rotatable element adapted to cause only the corresponding rotatable element to rotate with said shaft and to prevent the rotation of only said corresponding rotatable element, as desired, means individual to said latter means for con-

trolling its operation, normally hidden means individual to each rotatable element, and means individual to and associated with each rotatable element adapted to operate only the corresponding hidden means automatically to an exposed position when the corresponding rotatable element rotates for a predetermined timing period, said corresponding normally hidden means being adapted to be reoperated manually to its hidden position after each timing period.

2,001,832
AIR CONDITIONER

Walter Bandurski, Chicago, Ill.

Application August 29, 1934, Serial No. 741,968
12 Claims. (Cl. 257—244)

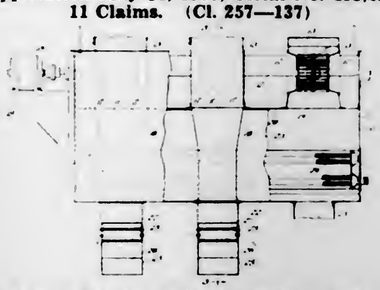


1. An air conditioner comprising a casing, an apertured end wall in said casing, a fan and motor carried by said wall for forcing a stream of air through said casing, a cone-shaped baffle axially carried within said casing and having its apex disposed toward said end wall, and air conditioning means for said air stream arranged within said casing in the form of a substantially cone-shaped coil.

2,001,833
AIR CONDITIONING APPARATUS

Ruddell J. Byrd, Irving, Tex.

Application March 29, 1935, Serial No. 13,621
11 Claims. (Cl. 261—92)

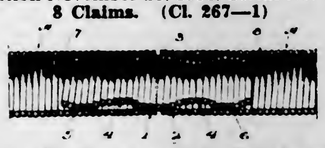


1. An air conditioning apparatus which comprises a rotor covered with absorbent material and having spiral vanes of said material, a tank containing liquid within which the rotor dips, thereby moistening said surfaces, means located in said tank for raising and for lowering the temperature of the liquid therein, means for drawing air through the rotor in contact with said moistened absorbent surfaces, and positive means for imparting rotation to said rotor, said rotation causing circulation of the liquid to insure uniformity of temperature through the body of the liquid.

2,001,834
VERTICAL UNIT HEATER

Clifford C. Carson, Chicago, Ill.

Application May 31, 1930, Serial No. 458,299
11 Claims. (Cl. 257—137)

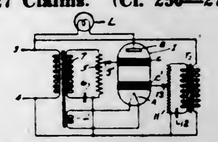


3. A unit heater of the suspension type comprising, in combination, a substantially vertical casing; a heating chamber in the lower portion of said casing; heating means in said chamber; a plurality of centrifugal fans adjacent to the upper end of the casing having discharge outlets connected to said heating chamber; a plurality of hot air discharge outlets, one for each fan, connected to the lower end of said casing and shaped to direct the air at an angle to the horizontal; by-pass conduits connected to said fans and passing through said casing at one side of the heating chamber; and relatively wide discharge nozzles at the lower ends of said by-pass conduits adjacent to said hot air conduits adapted to discharge curtains of relatively cold air at high velocity above and substantially parallel with the discharging hot air.

2,001,835
SPRING CONNECTER

Raymond W. Cook, Bristol, Conn., assignor to Wallace Barnes Company, Bristol, Conn., a corporation of Connecticut

Application November 26, 1934, Serial No. 754,903
8 Claims. (Cl. 267—1)

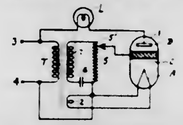


1. In combination, a spring coil, and means for connecting the ends of said spring coil, such means comprising a connecting device having a plurality of spaced portions engaging the convolutions of said spring coil, and a plurality of spaced portions spaced from the inner surface of said spring coil and of greater flexibility than said first-named spaced portions.

2,001,836
POWER CONTROL CIRCUITS

Palmer H. Craig, Cincinnati, Ohio, assignor to Invex Corporation, a corporation of New York

Application November 27, 1931, Serial No. 577,691
27 Claims. (Cl. 250—27)



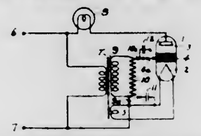
1. An electric control system comprising a vapor electric device having a cathode an anode and a control electrode, an alternating current circuit including the space current path of said device, means for impressing upon said control electrode an alternating voltage displaced in phase by a constant substantial angle substantially less than 180° with respect to the anode voltage for delaying the starting of the arc in said device, and means for varying the amplitude of said alternating control voltage to vary the amount of delay.

17. In an electric control system, the combination of a source of alternating current, a vapor electric device having a cathode an anode and a control electrode, a work circuit including said source and the space current path of said device, a transformer connected to said source, a secondary winding on said transformer, a circuit connected across said secondary winding including a resistance element and a capacity element connected in series relation, a circuit for impressing upon said control electrode a voltage derived from across at least a portion of said resistance element, and means for varying the amplitude of the voltage applied to said control electrode comprising a variable condenser connected in series with said control electrode.

2,001,837
POWER CONTROL CIRCUITS

Palmer Hunt Craig, Cincinnati, Ohio, assignor to Invex Corporation, a corporation of New York

Application December 10, 1932, Serial No. 646,662
17 Claims. (Cl. 250—27)

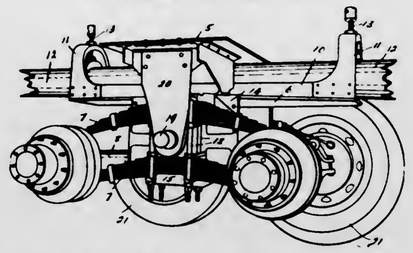


8. An electric control system comprising a vapor electric device having a cathode, an anode and means for influencing the discharge between said cathode and anode comprising two control electrodes, an alternating current circuit including the space current path of said device, means for impressing upon one of said control electrodes an alternating voltage to delay the starting of the arc, and a variable impedance control element connecting said second control electrode to a point on said alternating current circuit.

2,001,838
POWER CONTROL CIRCUITS

Palmer H. Craig, Cincinnati, Ohio, assignor to Invex Corporation, a corporation of New York

Application September 5, 1933, Serial No. 688,249
15 Claims. (Cl. 250—27)

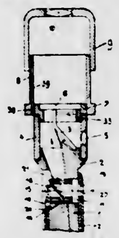


1. An electric control system comprising a vapor electric device having a cathode and an anode enclosed within an envelope containing an ionizable vapor, and a control electrode insulated from the space current path of said device, an alternating current circuit including the space current path of said device, and means for impressing upon said control electrode an alternating voltage of fixed phase and of variable amplitude to progressively delay the starting of the arc in said device.

2,001,839
LOG TRAILER

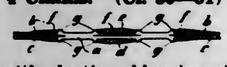
Herbert G. De Bou and Claude S. Thicke, Vancouver, British Columbia, Canada

Application June 22, 1934, Serial No. 731,958
In Canada April 3, 1934
3 Claims. (Cl. 280—33.2)



1. In a log trailer of the kind described, the combination comprising, a four-wheeled chassis, said chassis having a pair of trunnion blocks, each of said blocks being mounted between a pair of multiple leaf springs, said springs being mounted intermediate the axles of said chassis, flanged clamp plates positioned oppositely each other securing each of said springs to said trunnion block, bolts securing said clamp plates, springs and trunnion blocks to each other, a trunnion bearing mounted in said blocks, a bolster carriage mounted on said trunnion bearing adapted to oscillate independently of the axle of said wheels, and means for adjustably mounting a reach-pole in the chassis of said trailer.

2,001,840
LENS SHUTTER WITH COMBINED EXPOSURE METER, VIEW FINDER AND DISTANCE METER

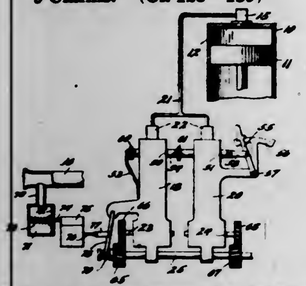


Alfred Gauthier, Calmbach-Enz, and Karl Bührle, Hofen-Enz, Germany

Application August 15, 1931, Serial No. 557,292
In Germany April 2, 1931
1 Claim. (Cl. 88—23)

A lens shutter with combined exposure meter and view finder, comprising in combination with the lens, a shutter casing concentrically surrounding said lens and provided with two light passages each having a light admission aperture at one end, a common ground glass screen covering the other ends of said passages and divided into separate sections by said passages, light regulating and deflecting elements of the exposure meter arranged in one of said passages, a light deflecting element for the view finder in the other of said passages, a view finder lens in the aperture at the end of said view finder passage, and a time adjusting disc in said casing constructed as a throttle element for the quantity of light entering the aperture of said exposure meter passage.

2,001,841
SHOE WITH ELASTIC RUBBER INSERT
Imre Goth, Berlin, Germany
Application November 25, 1932, Serial No. 644,297
In Germany November 29, 1931
4 Claims. (Cl. 36—51)



1. A shoe with elastic rubber insert, comprising in combination with the upper and lining of the shoe, said upper and lining having registering apertures, solid rubber inserts in said apertures covering the edges thereof.

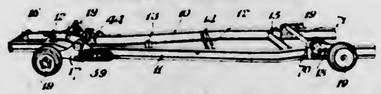
2,001,842
TEETHING AND FEEDING NIPPLE
Arthur C. Heise and Millard W. Jacobi, Baltimore, Md.
Application May 21, 1934, Serial No. 726,838
2 Claims. (Cl. 128—252)

1. A nipple comprising a body of soft rubber having its rear portion adapted for application to a bottle and having its forward portion enlarged to form a substantially spherical head merging into a reduced intermediate portion, an outlet opening being formed centrally of the outer end of the nipple, and a reinforcement of tough resilient rubber embedded in walls of the head, said reinforcement being substantially spherical in shape and extending the entire circumference of the head and longitudinally thereof for substantially the entire depth of the head but terminating in radial spaced relation to the outlet opening and in spaced relation to the reduced neck whereby the neck portion of the nipple may be constricted.

2,001,843
FUEL INJECTION SYSTEM FOR INTERNAL COMBUSTION ENGINES
Alexander T. Kasley, Prospect Park, Pa., assignor to D. C. E. Development Company, Wilmington, Del., a corporation of Delaware
Application May 12, 1933, Serial No. 670,779
Renewed February 11, 1935
9 Claims. (Cl. 123—139)

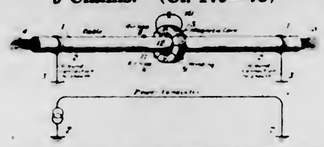
1. In a fuel feeding system for internal combustion engines, a plurality of pump units, separate conduits connecting said units with the injection nozzle of the combustion chamber of the engine whereby distinct charges of fuel may be delivered to said nozzle, separate aligned shafts operatively connected with the mechanism of said pump whereby axial movement of said shafts effects changes in the volumes of said fuel charges, said shafts being arranged in abutting relation, means for moving said shafts in one direction simultaneously, a stop on one of said shafts for limiting its movement in one direction, means for continuing the movement of another of said shafts after the first shaft has stopped, whereby certain of said pumps may deliver a larger charge than others.

2,001,844
FISHING BAIT
Arthur Kumm, Dearborn, Mich.
Application July 31, 1933, Serial No. 682,898
12 Claims. (Cl. 43—47)



1. In a fishing bait adapted to be drawn through water, the combination of a spindle member provided with a pair of spaced journal portions together with a passage extending therethrough, a body member movably mounted on one of the spaced journal portions of said spindle member, said body member being provided with a recess and slots extending from the recess to the outside of said body member, a ballast member provided with a portion extending within the recess of said body member together with fin members extending within the slots of said body member, said ballast member together with its fins tending to always maintain said body member in an upright position in the water, a second body member revolvably mounted on the other of said journal portions of said spindle member, said second body member being provided with slots, a propeller mounted in the slots of said second body member and adapted to revolvably operate said second body member when drawn through the water, a clip member extending through the passage of said spindle member, and hook members suitably connected to one end of said clip member, the other end of said clip member adapted to be connected to a draft member.

2,001,845
PERFORATED QUEEN-EXCLUDER IN BEEHIVES
Lars Ivar Hjalmar Larsson, Snopptorp, Eskilstuna, Sweden
Application January 31, 1933, Serial No. 654,417
In Sweden February 17, 1932
1 Claim. (Cl. 6—4)

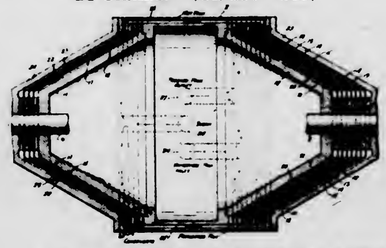


A queen excluder formed of sheet metal having a plurality of openings of greater length than width, one or more sides of the openings being folded back to provide a flange with curving surface throughout its length and width, said flange being in direct contact with the connecting member between the openings.

2,001,846
VEHICLE FRAME
Joseph Ledwinka, Philadelphia, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application July 8, 1932, Serial No. 621,369
5 Claims. (Cl. 280—106)

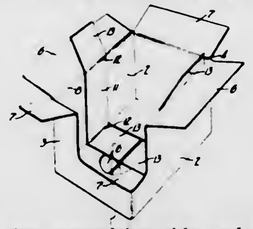
1. An automobile chassis sill of closed polygonal cross section comprised of a multiple number of longitudinally extending stampings joined together by lapped flanges located exteriorly of the closed section and characterized by a substantially vertical disposition of one of said joints at the upper outer edge of the section and the disposition of another of said joints substantially horizontally at the lower inner edge of said section.

2,001,847
SYSTEM FOR THE NEUTRALIZATION OF INDUCTIVE INTERFERENCE
Laurice Laird Lockrow, Brooklyn, N. Y., assignor to American Telephone and Telegraph Company, a corporation of New York
Application April 15, 1933, Serial No. 666,389
9 Claims. (Cl. 179—78)



1. A transformer arrangement for neutralizing the effect of induction from exposure to power circuits comprising a cable sheath, a plurality of conductors insulated from each other and enclosed within the cable sheath, the cable sheath being grounded at the ends of the section exposed to the power circuits, a core positioned coaxially about the cable sheath substantially at the midpoint of the voltage effect due to the exposure, a winding wound about said core, and a condenser connected to the winding, the condenser and the winding forming a circuit which is resonant at the frequency of the voltage effect induced from the power circuits.

2,001,848
ELECTRODE FOR ARC WELDING
August R. Nyquist, Roseau, Minn.
Application October 3, 1932, Serial No. 636,041
5 Claims. (Cl. 219—8)

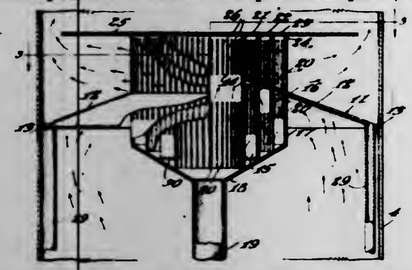


1. An electrode comprising a core of material having relatively good electrical conductivity and surrounded by a sheath of material having relatively poor electrical conductivity, and a flux combined with the aforesaid structure as an envelope therefor and composed of "basic compound", potassium nitrate, borax, and calcium carbonate in substantially the proportions stated.

2,001,849
REGENERATIVE PASTEURIZATION APPARATUS
Johannes Olsen, Aalborg, Denmark, assignor to Buaas Mejerimaskinfabrikker, Afdeling Af Aktieselskabet Frederiksberg Metalvarefabrik, Aalborg, Denmark, a corporation of Denmark
Application February 3, 1932, Serial No. 590,728
In Denmark April 20, 1931
14 Claims. (Cl. 257—245)

1. A regenerative heat exchange apparatus comprising a plurality of nested conical plates, annular flanges fixed to the apex and base portion of each conical plate for spacing the plates apart, the annular flanges having a plurality of ports therein providing passages for conducting fluid to and from the spaces between the nested conical plates and from one space between the nested conical plates to another.

2,001,850
CARTON
David H. Patterson, Jr., San Francisco, Calif., assignor to Fibreboard Products Inc., San Francisco, Calif., a corporation of Delaware
Application May 21, 1934, Serial No. 726,643
11 Claims. (Cl. 229—37)



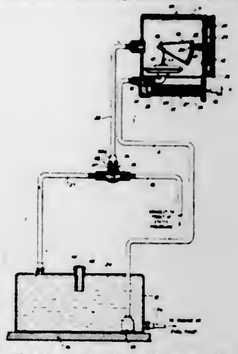
1. A carton comprising side and end walls, a pair of wide cover flaps, a pair of narrow cover flaps having a gap between the ends thereof, and an extension permanently secured on the carton and lying in said gap.

2,001,851
OIL AND GAS SEPARATOR
Edward J. Riley, Tulsa, Okla., assignor to Smith Separator Corporation, Tulsa, Okla., a corporation of Oklahoma
Application September 26, 1933, Serial No. 691,064
8 Claims. (Cl. 183—2.7)

1. In an oil gas separator, a tank having a lower mixture inlet and an upper gas outlet, a par-

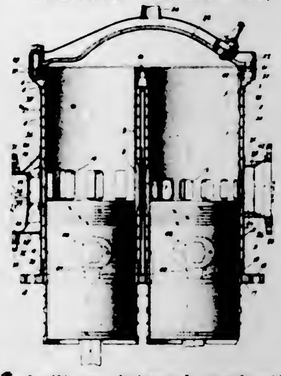
tition plate positioned in the tank between the inlet and outlet, lower slotted concentric tubes positioned below said plate and having annular solid portions, said portions being staggered relatively to one another, a funnel arranged in the tank below the tubes and abutting against the lower edges of said tubes, upper concentric slotted tubes positioned above the partition plate, the

slots of each of the upper tubes being staggered radially relatively to the slots of each adjacent upper tube, means closing the upper ends of said upper tubes, all of said lower tubes being closed at their upper ends with the exception of the inner one of said tubes, said inner lower tube communicating at its upper end with the inner one of said upper tubes, and pipes depending from the funnel and partition plate.



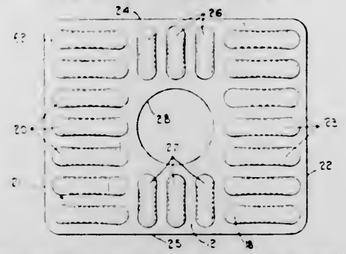
2,001,852
ILLUMINATING ELEMENT
Raoul Römer, Biel, Switzerland
Application February 20, 1933, Serial No. 657,662
3 Claims. (Cl. 176—122)

1. An illuminating element comprising a flat glass housing having two opposite flat walls, a chamber between said walls, and electrodes in said chamber between said walls and spaced apart to form a flat discharge field situated in a plane parallel to the said walls, one of said electrodes having laterally extended branches arranged in a row and spaced apart.



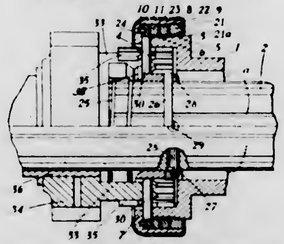
2,001,853
LIQUID LEVEL INDICATOR
Clarence Lee Seward, Jr., Washington, D. C., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Original application December 14, 1932, Serial No. 647,290. Divided and this application June 9, 1934, Serial No. 729,857
4 Claims. (Cl. 73—54)

1. In combination with a fuel tank adapted to be carried by an aircraft having an instrument panel, a pressure responsive gage remote from said tank and adapted to be mounted on said instrument panel for indicating the quantity of fuel in said tank in accordance with the pressure-head of said fuel, said gage including a casing, an indicator, a pressure-responsive member in said casing, and means for actuating said indicator by movement of said pressure-responsive means, a hydrostatic cell immersed in the fuel in said tank to the maximum depth of the fuel, a pipe-line connecting said cell to said pressure-responsive means whereby pressures corresponding to the height of the fuel in the tank are transmitted to the gage, means including a second pipe-line connecting the tank and the gage casing to a common venting point, and means con-



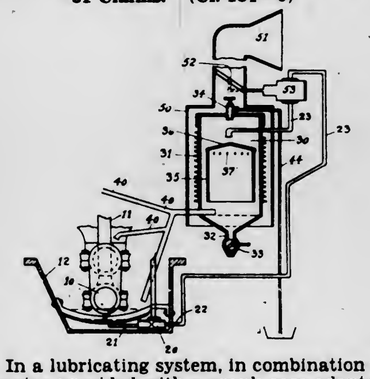
nected in said second pipe-line and controlled by forces of acceleration and gravity acting about either the transverse or the longitudinal axis of the aircraft for closing the connection between the tank and the gage casing to prevent passage of fuel into said casing due to acceleration of the aircraft and when said aircraft departs from level flight.

2,001,854
ENGINE CYLINDER BLOCK
Fred G. Shoemaker, Ferndale, and Gunnar E. Ehrling, Detroit, Mich., assignors, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application April 5, 1933, Serial No. 664,505
10 Claims. (Cl. 123—173)



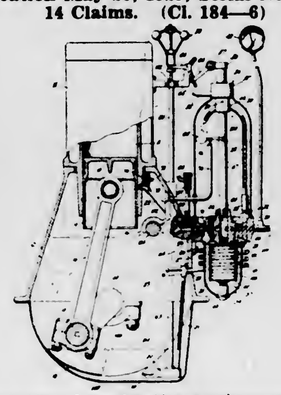
1. In a built up internal combustion engine cylinder block a cylinder barrel, a top deck flange forming part of a combustion chamber, a water jacket for the cylinder barrel, a closure for the water jacket at the combustion chamber end of the cylinder barrel consisting of a flange on the cylinder barrel, and ports in the flange for the flow of water from the water jacket of the cylinder barrel into a water jacket extension piece connecting the water jacket of the cylinder barrel to the top deck flange and constituting a cooling jacket for that part of the top deck flange forming part of the combustion chamber.

2,001,855
INDIA-RUBBER SPRING
Alexander Spencer, Westminster, London, England
Application June 24, 1932, Serial No. 619,165
In Great Britain March 22, 1932
5 Claims. (Cl. 213—40)



1. An india-rubber spring unit comprising a generally rectangular plate, bars of India rubber projecting from the faces of said plate, a portion of said bars being arranged in two spaced groups with one group adjacent each of opposite edges of the plate, and a plurality of bars on said plate intermediate planes passing through inner end portions of bars of said spaced groups, the bars of each of the spaced groups having their major axes normal to the respective adjacent edge of the plate and the major axes of the plurality of intermediate bars being normal to the major axes of the bars of the spaced groups.

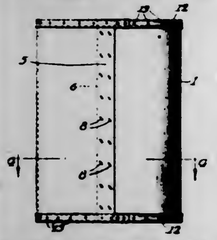
2,001,856
SYNCHRONIZING CLUTCH
Bernard Thomson, Combe Close, Woldingham, England, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 3, 1932, Serial No. 640,970
In Great Britain November 6, 1931
13 Claims. (Cl. 192—53)



1. Synchronizing clutch mechanism comprising companion toothed clutch elements adapted to be coupled and uncoupled and cooperating companion friction clutch elements adapted to be frictionally engaged before coupling of the toothed clutch elements in order to bring the latter to approximately the same speed by friction transmitted torque prior to interlocking them: the first of said friction clutch elements being fixed with respect to one of the toothed clutch elements, and the second friction clutch element capable of axial movement and having a driving connection with respect to the other toothed clutch element, said second friction clutch element comprising an advance engageable friction component, adapted to engage preliminarily the friction surface of its companion, and a relatively yieldable component arranged to seize the friction surface of said companion in response to rotation imparted to the advance engageable component by the preliminary engagement thereof, thereby transmitting a torque supplemental to that transmitted by the advance engageable component.

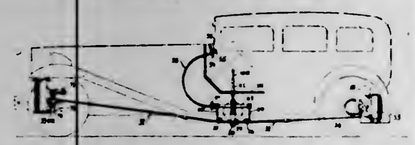
2,001,857
LUBRICATING SYSTEM
James Bertrand Watson, Detroit, Mich., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 10, 1926, Serial No. 121,606
31 Claims. (Cl. 184—6)

1. In a lubricating system, in combination with an engine provided with a crank case adapted to contain lubricant, a pressure tank provided with rapid heat transferring sides and a central storage chamber, means to exhaust the lubricant and vapors from the crank case and deliver the same under pressure to the tank, means inside the tank to direct the flow of incoming lubricant towards the heat transferring sides, means to maintain constant the pressure within the chamber, and means to convey the lubricant under pressure to the surfaces to be lubricated.



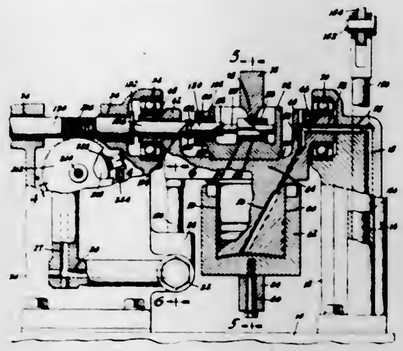
2,001,858
LUBRICATING SYSTEM WITH INITIAL SPLASH
James B. Watson, Detroit, Mich., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 20, 1929, Serial No. 364,471
14 Claims. (Cl. 184—6)

1. An internal combustion engine comprising: a crankcase; means therebelow for an initial re-



tention of oil at a level favorable to splash lubrication; a pressure receptacle; means for advancing oil thereto; parts to be lubricated; and means effecting delivery of oil from said receptacle to different parts under different predetermined pressures.

2,001,859
BARREL
Thomas R. Winchell, West Newton, Mass., assignor to Northern Maine Plywood Company, Portland, Maine, a corporation of Maine
Application July 22, 1933, Serial No. 681,746
11 Claims. (Cl. 217—1)

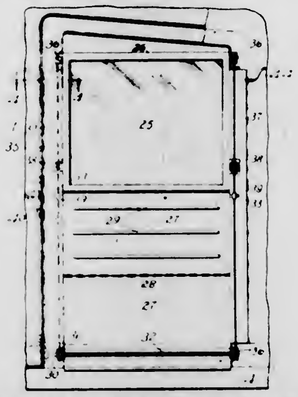


1. A practically hoopless barrel with countersunk heads, the barrel being entirely hoopless between the heads thereof, comprising a body formed of a single sheet of plywood composed of solidly united plies of wood veneer, with the grain of the wood extending crosswise in the different plies, so that some of the grain in effect forms a cylindrical hoop to prevent longitudinal splitting of the body, providing practically the only resistance to the bursting strain imposed on the barrel by the load therein, while other grain in effect forms a cylindrical stay to prevent circumferential splitting, and with a permanently fastened overlapping joint or seam extending longitudinally of the body at one side only thereof, formed by the overlapping ends of the sheet, with the outer edge of the overlap exposed throughout its length between the heads, fasteners inserted through the overlap and forming the sole means for maintaining the seam at all points between the heads, whereby said body constitutes the major strength of the barrel, end wall units in the ends of the body to form the countersunk heads of the barrel, and fasteners extending inwardly through the body into said heads, securing the latter in place.

2,001,860
JACKING APPARATUS FOR AUTOMOTIVE VEHICLES
Austin M. Wolf, Plainfield, N. J., assignor to Motor Jack Corporation, New York, N. Y., a corporation of New York
Application June 15, 1931, Serial No. 544,658
21 Claims. (Cl. 254—86)

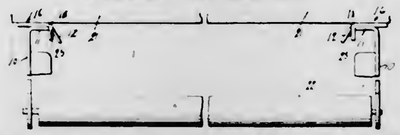
19. In combination, a lifting jack having a movable part, a power take-off, a tension member connecting said part and said power take-off for pulling the former, and means associated with the power take-off for pulling said member to actuate the jack.

2,001,861
MEANS FOR TESTING LUBRICANTS
John O. Almen, Royal Oak, Mich., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 17, 1933, Serial No. 657,211
12 Claims. (Cl. 265—10)



8. In apparatus for testing lubricants, the combination of fixed supporting means, a driving shaft and a swingable support on the fixed supporting means, means for mounting a test assembly consisting of a test arbor and bearing on the swingable support with the axis of the test arbor coaxial with the swing axis of the swingable support; means movable with the swingable support for applying pressure to the bearing; a pressure indicator; means for transmitting fluid pressure to the indicator comprising a double-ended cylinder, a piston, one end of the cylinder being connected by a duct to said pressure indicator and the other end vented so as to function as a dashpot, said cylinder being in communication between its ends with a supply reservoir, and means moving with the swingable support for actuating said piston.

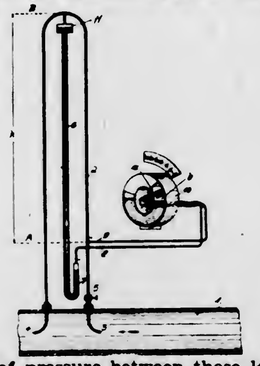
2,001,862
FACIAL TISSUE SUPPORT
Edith Carter Battey, New York, N. Y.
Application February 26, 1931, Serial No. 518,340
1 Claim. (Cl. 128—76)



A tissue support for treating facial lines, comprising a tissue-supporting member adapted to exert opposing forces on opposite sides of a facial line whereby to hold the lined tissue in a stretched condition transversely of said line, an adhesive adapted to secure said member to the facial tissues, the member being formed of a moisture-absorbing material having a capacity for shrinkage upon drying, and a moisture-resisting coating on the outer surface of said member whereby upon loss of moisture incident to drying upon the wearer's face the said member is caused to warp concavely toward the face.

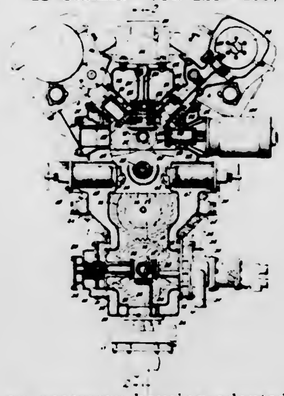
2,001,863
AUTOMOBILE DOOR
Charles E. Bedaux, Monts, France
Original application April 27, 1933, Serial No. 668,184. Divided and this application November 16, 1933, Serial No. 698,306
6 Claims. (Cl. 296—44)

1. A sectional automobile door, means substantially parallel to the edges of the door connected to both of said sections to move one section upwardly into position to form a shelter and another section downwardly to form a step, and means to move a rubber closure member into contact with an edge of said door when it is closed.



2,001,864
HINGE BRACKET
Samuel Benjinsohn, New York, N. Y., assignor to Sarah Benson, New York, N. Y.
Application August 16, 1934, Serial No. 740,086
4 Claims. (Cl. 156—24)

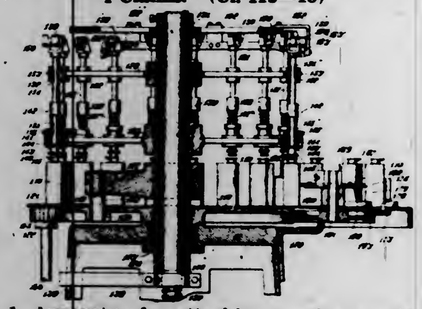
2. In a bracket hinge, an anchor plate and a bracket arm, said anchor plate being bent to form a securing side and a hinge side, and slotted longitudinally of the bend, said bracket arm having a hinge end and a supporting end, and being bent at its hinge end to form a stop, and means in the bracket arm adapted to engage said anchor plate through its slotted portion, and be held in hingeable relation therewith.



2,001,865
GAS DENSITY METER
Johann Brandl, Vienna, Austria, assignor to the firm Compagnie pour la Fabrication des Compteurs et Matériel d'Usines à Gaz, Montrouge (Seine), France
Application December 10, 1932, Serial No. 646,617
In Austria December 11, 1931
4 Claims. (Cl. 265—44)

2. In a device for measuring the density or specific gravity of a gas flowing through a conduit, a by-pass of the said conduit, arranged so as to allow a slow flow of the gas therethrough and comprising an inverted U-shaped pipe one limb of which constitutes a stand-pipe adapted to permit of the formation therein of a continuously renewed gas column having a pressure difference between two different levels substantially equal to the static pressure due to the weight of the column, a differential-pressure indicating device, and means whereby said indicating device is connected to the stand-pipe at two different levels of the gas column so as to indicate the

difference of pressure between these levels, said means including an upright U-shaped tube containing a balanced liquid column connecting one side of said differential-pressure indicating device with the said stand-pipe at one of the said gas column levels thereof so as to transmit the pressure existing at this level substantially to the height of the other gas column level.



2,001,866
ACCESSORY DEVICE HOUSING FOR INTERNAL COMBUSTION ENGINES
Harold Caminez, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 31, 1933, Serial No. 673,589
13 Claims. (Cl. 123—195)

1. In an accessory housing adapted to be secured to one end of the crank case of an internal combustion engine, two accessory device driving shafts located within said housing; means for driving one of said shafts from one end of the crank shaft of the engine; means for driving the other of said shafts from the other end of said crank shaft; a plurality of accessory devices carried by said housing and having driving shafts which extend thereinto; gearing whereby some of said accessory devices are driven by one of the

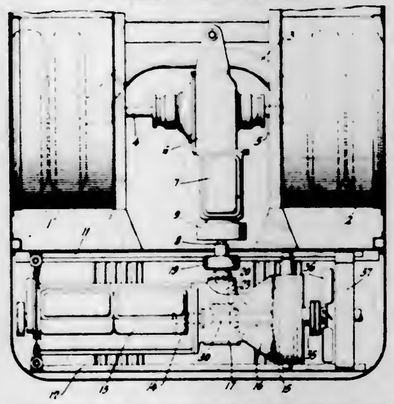
two shafts aforesaid; and other gearing whereby other of said accessory devices are driven by the other of said shafts.

2,001,867
AUTOMATIC EXPANDING MACHINE
George W. Chalmers, Summit, Ill., assignor to International Patents Development Company, Wilmington, Del., a corporation of Delaware
Application July 29, 1933, Serial No. 682,839
4 Claims. (Cl. 113—18)

1. Apparatus for attaching pouring spouts to cans comprising in combination, a revoluble table, a plurality of expanding tools arranged in spaced relation above said table, a centrally disposed shaft, a tubular shaft rotatable on the central shaft, means on the tubular shaft for supporting said expanding tools, means on the tubular shaft and slidably engaging the table for connecting said tubular shaft with the revoluble table, means on the central shaft for raising and lowering the expanding tools, means for holding said central shaft against rotation, and means for vertically adjusting the central and tubular shafts relative to said table.

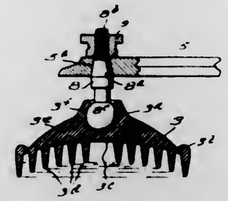
4. A machine for securing spout structures to sheet metal cans comprising in combination, a revoluble table for receiving successive cans on which the spout structures are loosely supported, expanding tools movable with said table and adapted to be raised and lowered relative to said cans, forwarding means for moving successive cans onto said table and positioning them beneath said expanding tools, and spout adjusting means positioned to engage said spout structures during the movement of the cans onto said table, to rotate said spout structures into predetermined angular positions on the cans.

2,001,868
HAMMER
Merton L. Crandall, Jackson, Mich.
Application March 31, 1934, Serial No. 718,398
2 Claims. (Cl. 254—26)



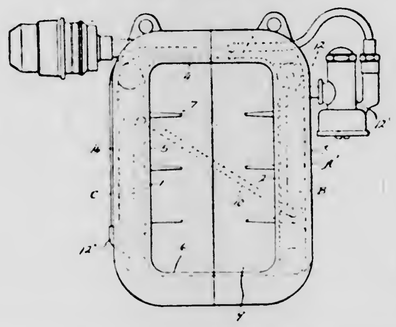
1. A hand hammer comprising a head having a striking face and a nail pulling claw, a protuberance having outwardly extending ears disposed on said head between said face and said claw, the outer surface of said claw adjacent the tip thereof being curvilinear and constituting a rocking fulcrum during the initial nail pulling operation, a roller mounted between said ears for rotation, said protuberance and roller being disposed to one side of a plane tangential to said surface, said roller constituting a rolling fulcrum during the final nail pulling operation.

2,001,869
PROCESS OF MAKING LEAD-HEADED SCREW-THREADED NAILS
Albert J. Deniston, Jr., Chicago, Ill.
Application July 27, 1934, Serial No. 737,153
8 Claims. (Cl. 10—10)



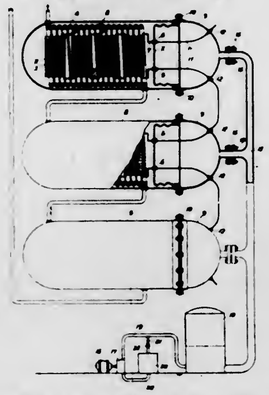
1. The process of manufacturing screw-threaded fasteners, which resides in taking a blank having a shank coated with corrosion resistant material and a pointed end and shaping screw-threads substantially throughout the length of said shank and terminating in said pointed end, said shaping thereof resulting in the surfaces of said threaded shank retaining a substantial protective covering of the corrosion resistant material and made bright and smooth to facilitate rotational driving of the threads of the fastener into holding position.

2,001,870
MOTOR VEHICLE DRIVING MECHANISM
Howard A. Flogaus, Ferndale, Mich., assignor to General Motors Truck Corporation, Pontiac, Mich., a corporation of Delaware
Application June 21, 1934, Serial No. 731,668
7 Claims. (Cl. 180—70)



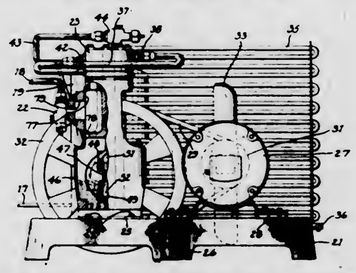
1. Vehicle driving mechanism, including differential and change speed gearing arranged in longitudinal succession between the road wheels, a transversely disposed power plant located principally to one side of the vehicle center line, a flywheel on the opposite side of the vehicle center line, a power shaft connecting the power plant and flywheel and having accessory drive means beyond the flywheel, a driven sleeve surrounding said shaft and having clutch mechanism at one end for engagement with said flywheel and a driving pinion at its other end, and a driven gear meshing with said pinion and having drive connection with the input side of the change speed gearing.

2,001,871
MASSAGING DEVICE
Claud H. Foster, South Euclid, Ohio
Application June 29, 1931, Serial No. 547,625
1 Claim. (Cl. 128—59)



A massaging pad consisting of a unitary body of resilient material having a peripheral rim and having a shallow upwardly concave lower surface within said rim and provided with integral fingers projecting from such lower surface, the back of the said pad being thickened from the rim toward the central portion thereof and provided within the central portion with a spherical socket adapted to receive and to removably retain therein the spherical end portion of a supporting stud, the upper portion of such socket being relatively thin to facilitate the insertion thereinto and removal therefrom of the spherical portion of said stud.

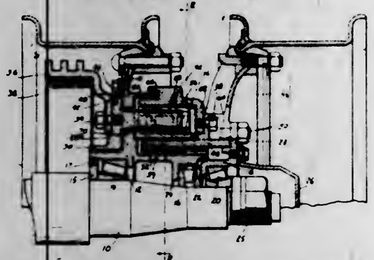
2,001,872
COOLING UNIT
Harold A. Greenwald, Detroit, Mich., assignor, by mesne assignments, to Kelvinator Corporation, Detroit, Mich., a corporation of Michigan
Application May 18, 1931, Serial No. 538,335
6 Claims. (Cl. 62—95)



6. A cooling unit having a body comprising two complementary C-shaped sections secured together adjacent the top and bottom to provide a freezing zone, a refrigerant evaporating coil embedded in a side wall of said zone formed by one of said sections, a refrigerant evaporating coil embedded in the opposite side wall of said zone formed by the other section, and an independent connection between said coils.

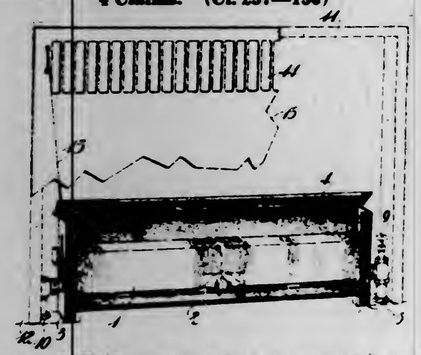
2,001,873
ELECTRICAL CONDENSER
Bror Hansson, Stockholm, Sweden, assignor to Allmanna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, a corporation of Sweden
Application November 19, 1932, Serial No. 643,456
In Sweden November 19, 1931
4 Claims. (Cl. 175—41)

1. An electrical condenser consisting of conducting foils separated by dielectric films, a hermetically closed elastic vessel containing said elements, an insulating fluid entirely filling said vessel, a pressure chamber adjacent to said elastic vessel and filled with a medium under pressure, the elastic vessel being exposed to the pressure of said medium, tight leading through insulators arranged in the walls of said vessel, and conductors connecting said foils to terminals arranged in said insulators.



2,001,874
COMPRESSING UNIT
Edward Heitman, Detroit, Mich., assignor to Kelvinator Corporation, Detroit, Mich., a corporation of Michigan
Application October 12, 1931, Serial No. 568,319
1 Claim. (Cl. 230—206)

A refrigerant compressing unit comprising a compressor having a crankcase and including a cylinder disposed above the crankcase, a valve plate arranged to close the top of the cylinder, a piston reciprocable in the cylinder, an inlet valve carried by said plate, a wall for the compressor having a passage formed therein and an inlet leading to said passage, said passage at opposite ends being in communication with the inlet valve and the crankcase, respectively, and means for supplying refrigerant vapor mixed with oil to said passage at a point below said inlet valve, said passage having a relatively



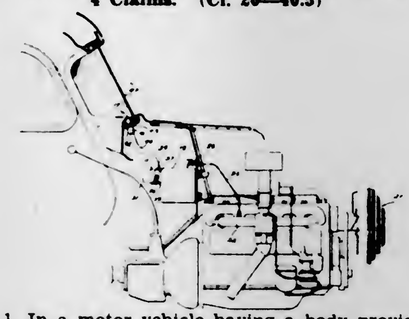
large cross sectional area as compared with said inlet whereby said vapor and oil become separated by change in velocity upon entering said passage.

2,001,875
BRAKE
James F. Higbee, Detroit, Mich., assignor of one-half to Stephen A. Griggs, Detroit, Mich.
Application September 26, 1931, Serial No. 565,251
13 Claims. (Cl. 188—2)

1. A vehicle road wheel assembly comprising a pair of road wheels, a drum carried by each wheel, brake mechanism operable to retard the rotation of one drum, and applying mechanism for said brake mechanism associated with the other drum and its wheel to be actuated thereby.

2,001,876
SHEATH FOR RADIATORS AND THE LIKE
Fredrik W. Hvoslef, Kohler, Wis.
Application December 23, 1933, Serial No. 703,740
4 Claims. (Cl. 257—136)

2. A radiator sheath adapted to enclose a radiator and comprising a pair of end portions, means comprising a pair of bolts extending through longitudinal slots in each of said end portions for attaching said radiator to said end portions whereby to permit vertical adjustment of either end of said radiator; a slot in each of said end portions adapted to permit passage therethrough of a nipple connection, a back portion attached to said end portions, a hinged top portion, and means for actuating said top portion to act as a damper.

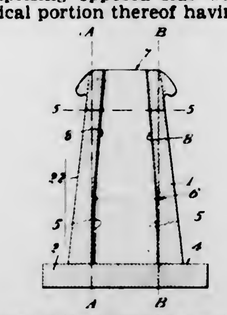


2,001,877
VEHICLE BODY CONSTRUCTION
Hugh A. Johnson, Detroit, Mich., assignor to Hupp Motor Car Corporation, Detroit, Mich., a corporation of Virginia
Application February 26, 1934, Serial No. 713,048
11 Claims. (Cl. 20—40.5)

1. In a motor vehicle having a body provided with a windshield opening having a shoulder at one side, a windshield within said opening engaging the inner side of the shoulder, means for holding the windshield in engagement with the shoulder including a molding fixed to the body

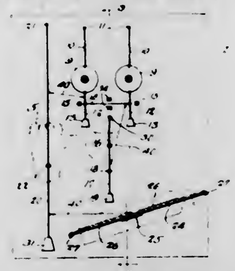
at the inner side of the windshield in engagement with the latter and fashioned to receive air, means for discharging air into said molding and the latter having openings therethrough directed toward the inner surface of the windshield.

2,001,878
MOTOR VEHICLE
Hugh A. Johnson, Detroit, Mich., assignor to Hupp Motor Car Corporation, Detroit, Mich., a corporation of Virginia
Application April 30, 1934, Serial No. 723,246
4 Claims. (Cl. 20—40.5)



1. In a motor vehicle having a body provided with a windshield, the combination with a heater assembly having an air discharge passage and having means for discharging preheated air through the passage, of a molding fashioned to receive air and removably secured to the body at the inner side of the windshield in engagement with the latter to hold the same against inward movement and having an opening in the top wall thereof, and means establishing communication between the molding and discharge passage of the heater permitting warm air to be conducted to the molding.

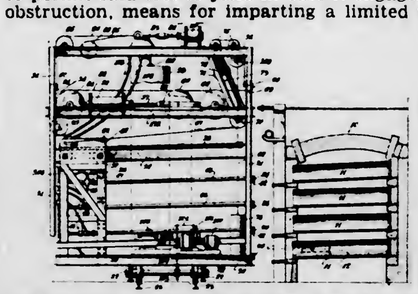
2,001,879
INGOT MOLD
Edmund J. Kauffman, Girard, Ohio, assignor to Valley Mould & Iron Corporation, Hubbard, Ohio, a corporation of New York
Application July 23, 1932, Serial No. 624,202
6 Claims. (Cl. 22—139)



5. A big-end-down ingot mold for casting steel ingots having a substantially rectangular longitudinal cross-section, comprising an integral body portion of heat absorbing material having a differential inwardly tapered matrix therein, the bottom portion of the matrix having a slight inward taper, and a vertical cross-section of said

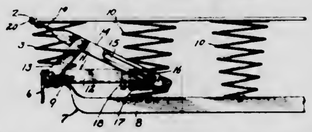
matrix comprising opposed side walls with the middle vertical portion thereof having an inward

taper in excess of the inward taper in the bottom portion of the matrix.



2,001,880
ADVERTISING DEVICE
Herbert D. Lambourne, Baltimore, Md., assignor of forty-five per cent to John G. Onnen, twenty per cent to John W. Simpson, ten per cent to Stanley E. Simpson, and five per cent to George H. Becker, all of Baltimore, Md.
Application June 19, 1934, Serial No. 731,272
3 Claims. (Cl. 40—138)

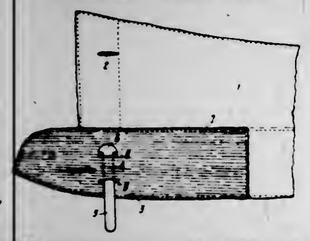
1. In a device of the class described, comprising a background panel with a face painted thereon having openings at the positions of the eyes, eye discs representing eye balls and pupils resiliently mounted on the background card behind said openings, with guides to permit a movement up-and-down thereof and a relatively slight horizontal movement, a member representing a hand mounted on the front side of the panel and adapted to have a horizontal movement, a pendulum link to so operate the hand, a member representing the lower lips and jaw of the face mounted on the front of the panel, a link for resiliently suspending the last mentioned member and having a weight attached thereto all adapted to give vertical movements to the same, a member representing a product mounted on the front of the panel in a slanting direction and having resilient attachments thereto, and a plurality of links interconnected with said discs, hand member, jaw member and product members to make them actuate with each other.



2,001,881
RETORT CLEAN-OUT MACHINE
Hugh R. MacMichael, El Paso, Tex., assignor to American Smelting & Refining Company, New York, N. Y., a corporation of New Jersey
Application July 29, 1932, Serial No. 625,736
7 Claims. (Cl. 214—24)

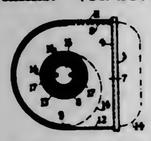
6. In a cleaning mechanism, a substantially horizontal retort, a cleaning mechanism comprising a carrier, a tool substantially stationary with respect to said carrier, said tool comprising a long shaft having a transverse blade on its projecting end, means for mounting said shaft on said carrier at one end of the shaft only, whereby the tool projects as a cantilever from said carrier, spring devices between said tool and said carrier to permit said tool to yield in case it engages an obstruction, means for imparting a limited ver-

tical movement to said carrier, means to move said carrier toward and away from said retort to cause said tool to enter and leave said retort, and stop devices defining the upper and lower limiting positions of said carrier whereby the lower position of said tool causes it to rest on the bottom surface of its retort and the upper position of said tool is in line with the free space above the charge in said retort.



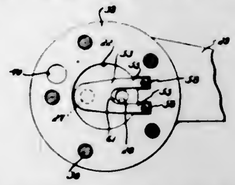
2,001,882
EDGE SUPPORTING DEVICE
Joseph Martin, New York, N. Y., assignor to United States Cabinet Bed Co., Brooklyn, N. Y., a corporation of New York
Application December 27, 1932, Serial No. 648,906
2 Claims. (Cl. 5—262)

1. The combination with a mattress having an upper outer rectangular frame composed of round stock, of a lower smaller rectangular frame composed of angle iron having its horizontally extending flange at its upper end and normally offset inwardly relative to said upper frame, inner coil springs separating and operatively connecting said upper frame to said lower frame, edge supporting devices permitting the depression of said upper frame at least one half the normally extended distance from said lower frame, each having a horizontally extending bar composed of angle iron and having its horizontally extending flange disposed at its lower side, the outer end of the horizontally extending flange of said bar being secured to the horizontal flange portion of one of the longitudinally extending sides of said lower frame, a pin formed at the inner end of the vertically extending flange of said bar, an abutment extending downwardly from the horizontally extending flange of said bar and spaced from the inner end thereof, a lever composed of flat stock and having a slot dividing the same into a short arm and a long arm, the slot receiving said pin with the short arm of said lever extending inwardly below said bar, a spring connecting the free end of said short arm with said abutment, a link composed of flat stock and piv-



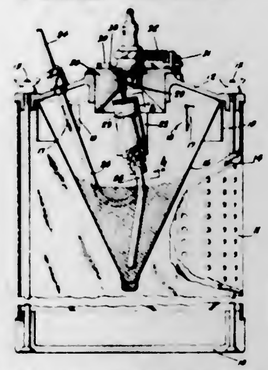
otally connecting the long arm of said lever with the vertically extending flange of said bar, the upper portion of said long arm being bent at right angles to the lower portion thereof and being formed into a loop at its extreme upper end to receive one of the longitudinally extending sides of said upper frame and forming a pivotal connection with the same.

2,001,883
COLLAR FOR PERSONAL WEAR
James Templeton Deans McNicol, Glasgow, Scotland, assignor of three-fourths to David & John Anderson, Limited, Glasgow, Scotland
Application November 8, 1934, Serial No. 751,992
In Great Britain May 11, 1934
3 Claims. (Cl. 2—132)



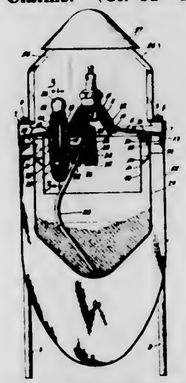
1. A collar having an outer fold and an inner fold, the inner fold having loops adjacent each end thereof, pockets in the outer fold adjacent each end thereof, said outer fold having entrance openings to the pockets in its inner face, said openings being at a lower level than said loops and in alignment therewith, and a stiffener passing through each loop of the inner fold and having their lower ends received in the pockets of the outer fold, said stiffener having a headed upper end which prevents the stiffener from passing downwardly through the loop portion.

2,001,884
FILM BOX OR CHARGER
Arthur Samuel Newman, Highgate, London, England, assignor to Pathéscope Limited, London, England
Application September 1, 1934, Serial No. 742,384
In Great Britain September 18, 1933
3 Claims. (Cl. 242—71)



1. A film box or charger having an outer casing and an inner part, the inner part having means for carrying a transverse tube adapted to carry at one end a roll of sensitized film and at the other end a take-up centre piece on to which the exposed film is wound, means for locking the casing to the inner part consisting of a flanged tube, the tubular part passing through an aperture in the outer casing and fitting tightly within the said transverse tube and the flanged part fitting closely against the outer casing, the said centre piece being provided with means so that it may be driven through the locking device and the transverse tube, and two apertures, the one to allow the film to pass out of the box and the other to allow the exposed film to return to the take-up centre piece.

2,001,885
REFRIGERATING APPARATUS
Grayston R. Ohmart, Detroit, Mich., assignor to Kelvinator Corporation, Detroit, Mich., a corporation of Michigan
Application May 11, 1932, Serial No. 610,632
2 Claims. (Cl. 230—228)

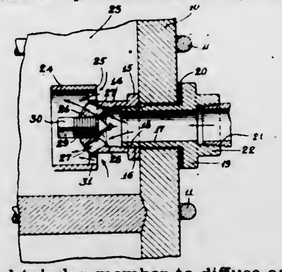


1. In a compressor the combination with means providing a compression chamber, said means having inlet and outlet ports communicating with the interior of said chamber, a reed valve having a pair of relatively narrow supporting legs at one end secured to said means and constituting the sole support of said reed valve, and said valve being so positioned that the free end thereof is arranged for controlling one of said ports and the space between said supporting legs being in alignment with the other port to permit the passage of fluid through the latter port.

2,001,886
SPARK PLUG CLEANING DEVICE
Hector Rabezzana and Alexander J. Battey, Flint, Mich., assignors, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 6, 1932, Serial No. 591,364
4 Claims. (Cl. 51—8)

1. In a spark plug cleaning device of the class described, a sand containing receptacle conical in form and arranged with its smaller end downward, and the upper end of which is secured to and closed by a closing member or head which supports said receptacle, and has a centrally located opening, and which receptacle has an air and entrained dust outlet adjacent its upper end; a spark plug supporting member located within said opening and having itself an opening for receiving the inner end of a spark plug to be cleaned; a supporting arm depending from said head; and a nozzle supported by said arm and located above the sand in said receptacle; said nozzle having a depending sand supply pipe, and an air supply pipe leading through the head aforesaid, and which nozzle is arranged to project a jet of air and sand in a direction inclined to the axis of and against the inner end of a spark plug supported as aforesaid.

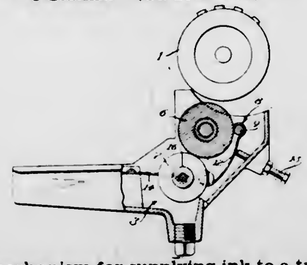
2,001,887
SPARK PLUG CLEANING DEVICE
Hector Rabezzana and Alexander J. Battey, Flint, Mich., assignors, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 26, 1932, Serial No. 634,878
9 Claims. (Cl. 51—8)



5. In a spark plug cleaning device, a head having means for supporting a spark plug to be cleaned; a nozzle arranged to project a stream of mixed air and abrasive material against a spark plug supported by said supporting means; a pipe through which an abrasive material is supplied to said nozzle; a passage through which air under pressure is supplied to said nozzle; and a restriction plug arranged in said last mentioned air supply passage and having a permanently open and invariable restricted opening therethrough of less area than said passage.

2,001,888
SPARK PLUG ELECTRODE
Donald W. Randolph, Flint, Mich., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
No Drawing. Application May 6, 1932, Serial No. 609,771
11 Claims. (Cl. 123—169)

1. A spark plug having an electrode made of an alloy having as its major constituent a base metal such as nickel-cobalt metal, a metal of the alkaline earth group to reduce the sparking voltage, and chromium to increase emissivity, resist corrosion and retard evaporation of the metal.



2,001,889
NOZZLE
Frank J. Rash, Chicago, Ill., assignor of one-half to Elmer W. Barth, Chicago, Ill.
Application March 21, 1934, Serial No. 716,680
3 Claims. (Cl. 261—77)

1. In a device of the character described, the combination with a tubular member defining a passage, of an enlarged tubular member formed axially of said first named tubular member for attachment thereto to define a peripheral shoulder in spaced relation from the entrant orifice of said tubular member, there being openings in the peripheral face of said shoulder for enabling the circulation of the surrounding medium, there being inclined apertures extending between said tubular members to establish communication for steam or other medium passage from one to the other, a conical tip extending axially within said

first named tubular member to diffuse and direct the steam through said inclined apertures, and means for connecting a pipe line to the entrant orifice of said first named tubular member for directing the injecting medium through said inclined apertures to said enlarged tubular member.

2,001,890
TYPE CYLINDER PRINTING DEVICE
Edward G. Rix, Chicago, Ill., assignor to The International Check Endorser Co., Chicago, Ill., a corporation of Illinois
Application June 3, 1932, Serial No. 615,164
6 Claims. (Cl. 101—350)
